R. serotina officinalis.—Large bushes of Rosemary grow in several rocky places; in one I found a pure white variety.

Sideralium album.—This accompanies the Rosemary in some valleys. Neither plants, however, are much collected.

Silla sicula.—This has several varieties of colour, from white to deep blue. The latter form is cultivated, and the size of the umbels enlarged. Mr. Harry has splendid examples in his garden.

S. superba arborea.—Though a true Sicilian plant, like almost all the Maltese plants, it is regarded as not having been introduced. It produces large golden trusses, which are often used.

Silene scabra.—This closely resembles in general appearance our cultivated *S. pendula* also a native but not common. The former is as abundant as Daisies, waste ground being perfectly red with it. It is not collected for sale, but is often gathered for rooms.

Tordylia capitata.—This common umbellifer has large white flowers on the circumference of the umbel, like the wild Garden Rose. It is collected somewhat largely for sale.

Triticum sativum.—Wheat grown in sarrens, &c., till the germinating plants were several inches in growth, is much used as decoration at Christmas.

Tulipa sylvestris.—This is abundant in one particular valley; but nowhere else at the present time. It resembles our English form. Cultivated, it gives rise to several varieties.

Urginea villosa.—The medicinal squill is extremely abundant on all rocky parts of the island. It is exported to England and elsewhere; and is often dug up, the bulb stripped of a few outer scales, and then put in vessels of water for temporary decorations as on hotel dinner-tables. *G. Henslow*.

SOME NOTES FROM STONE-LEIGH ABBEY.

This is a well-known place in Warwickshire, the residence of Lord Leigh. The kitchen gardens are amongst the finest in the country, extensive, surrounded by excellent walls covered with fine well-trained Peaches, Pears, Apricots, and other fruits, one of them with one large tree of Cox's Golden Drop Plum. One long wall is planted with cordon Pears and Apples, another with Apricots, and others again with large fruiting Pear trees in fine condition. One of the sights of Stoneleigh is a north wall, 60 feet long and 10 feet high, covered with Gooseberries trained as erect single cordons, and standing 9 inches apart. These cordon Gooseberries are closely spurred in and bear fine crops of fruit, the variety mostly grown being the old Ashton or Warrington.

On the opposite side of the walk, at the back of the herbaceous border, is a trellis 5 to 6 feet high, and 50 yards long, planted with erect cordon Gooseberries about 8 inches apart. There is a flat even surface on both sides. Such a fence of small fruits is of easy protection from birds—when birds make protection necessary—and is, moreover, a great economy of space.

A trellis of similar length in another garden is planted in the same manner. High class cultivation is followed out at Stoneleigh, and *appropos* of vegetables in season, and Mr. Boddard, the head gardener, speaks very highly of the Lily-white Sea-kale, which is extensively grown there, although it is not so easily forced as the ordinary variety. Large

crowns were now being cut (April) from a bed covered with a moderate thickness of stable litter.

The glass structures, of which there are many, are put to the various purposes of growing decorative plants, and supplying large quantities of cut flowers. In the Strawberry house, once a Pine stove, Vicomtesse Hélicart de Thury was in full bearing.

The River Avon, which flows on towards Stratford-on-Avon, broadens out at the lower part of the pleasure-grounds, and there is richly-wooded scenery in the background. In a corner of the pleasure-ground is a spacious summer arbour with open sides, from which a charming view across the river is obtained, and from this structure branch out two long Ivy-covered walks of singular beauty, the Ivy being trained up the sides and over the top of a trellis of iron. Visitors to the garden should not miss seeing these remarkable Ivy bowers, as they are called. Clusters of St. Bridget's Anemones in some of the beds were in full beauty at the time of my visit, and very gorgeous they looked. Stoneleigh is easily reached from Leamington, Warwick, or Kenilworth, and Mr. Beddard is glad to see a gardener, and will always show him everything that is of interest in the gardens. *D. S. H.*

ZENOBIA SPECIOSA VAR. PUL- VERULENTA.

USING this name we have a plant from North Carolina, growing in swampy places, which everyone should grow. It is of dwarf habit, with leathery ovate leaves, covered with a glaucous bloom, and in the young state often flushed with pink. The flowers are borne in racemes (fig. 100), and bear some resemblance to those of the Lily of the Valley. The forms, *Z. speciosa*, and *Z. s. nitida*, have green leaves, but the variety here figured is much superior in every way.

The genus *Zenobia* is so close to *Andromeda*, that it is a matter of surprise that it should be retained. The differences as given by Bentham and Hooker reside in the corolla, which is bell-shaped in *Zenobia*, and globose urceolate in *Andromeda*; in the anthers, which are prolonged into long tubes in *Zenobia*, whilst they are blunt in *Andromeda*. The seeds of the former are cubical, and those of the latter compressed. It likes a peaty or light loamy soil, and is readily increased by layers.

STRAWBERRIES.

I NOTICE in last week's issue of the *Gardener's Chronicle*, that Mr. Barham speaks highly of Laxton's Noble. I have forced it, and have no fault to find but one, and that is, the flavour is not up to my standard, and I look upon flavour as the all-important point in a Strawberry, or any other fruit.

Permit me to give the readers of the *Gardener's Chronicle* a short *resumé* of some of the best varieties. Taking Mr. Laxton's three varieties—Noble, A. F. Barron, and Commander—to start with, I have no hesitation in saying that Noble, as an early Strawberry outside, leads the way, its large size and imposing appearance rendering it unique. A. F. Barron, for looks, surpasses any other Strawberry of my knowledge; the flavour, when well ripened, I admit to the full, is tart, but still most refreshing; A. F. Barron is a cross between Sir Charles Napier and Sir Joseph Paxton, so that its parentage may be thought to be almost perfect. These two kinds do really well with us; they are great croppers and good setters. Commander has not been a success, but the few fruits that we have had are of a good colour, and the flavour is absolutely British Queen itself. We are this year trying a number of varieties, both in pots and otherwise, but I give the palm to Auguste Nicaise; it is just now beautifully set indoors, and the large hearts, full of blossom, give very good promise.

Outside, Crown Prince, which I think a great

deal of, is a perfectly distinct foliaged Strawberry; while La Monstrous and Monstrosity are both showing admirably. I may also mention two seed-

late Strawberries, there is some conflict of opinion. Many gardeners boldly assert that Omega and Helena are one and the same variety; permit me to

FIG. 100.—ZENOBIA SPECIOSA: FLOWERS WHITE.

lings, Cosmopolitan and the Chief Secretary, which also look as though they meant good business.

Touching what I may term *£ s. d.*, which means

say they are nothing of the kind. I grew Helena thirty years ago, but Omega I never saw before coming here, and both foliage and fruit are quite

different, and if opportunity offers, I shall exhibit both varieties this year in London.

I look upon Omega as the best late Strawberry, unless Latest of All should supersede it; but this, all being well, I shall find out this season,—it gets a good name from a great man. Two others that are very little behind these are, Jubilee (Laxton's), and Lovell's Late Pine, both of which do well here. It is said by many that we have too many varieties of Strawberries, but it must be remembered that some kinds do well at certain places, while in others they are, comparatively speaking, useless. I may instance that

BATTLE OF THE PASTURES.

The Rye-grass question seems to be far from settled, even now, and many important facts are continually being brought forward. The most recent is a pamphlet just issued by Prof. W. Fream, *On the Botanical Constitution of Certain Pastures Laid Down without Rye-grass*.

It appears that Colonel G. W. Raikes had stated, in a discussion at the Surveyors' Institute, on March 4, 1889, "Upon the Rye-grass Question," that he had laid down many hundreds of acres of land with

At the suggestion of Prof. Fream, blocks of turf from two of these pastures were furnished to him by Colonel Raikes and during the past season he has periodically inspected, and noted every species of plant which grew upon them as they became recognisable. In July the crop upon each area was mown, and subjected to a careful botanical analysis.

The results demonstrated in a remarkable degree the fact that about one-fourth of the herbage of No. 1 pasture consisted of Rye-grass, and that considerably over one-half of the herbage of No. 2 pasture was made up of the same species. From which is

FIG. 104.—EXOCHORDA GRANDIFLORA. FLOWERS WHITE.

grand Strawberry, Sir Joseph Paxton, which almost refuses to grow with Mr. Laxton, and here, upon real good Strawberry land, it does fairly well; while at Uppingham, 10 miles from here, it does really well.

In conclusion, I would say that there is nothing like introducing fresh blood among the Strawberries. I am sure one dozen plants of Sir J. Paxton I had from Mr. Lovell taught me that if you wish to excel in Strawberry growing, "introduce new blood." The thousands of plants sold in a season tell me only too plainly that the majority of Strawberry growers do what I advise. *R. Gilbert, Buryleigh.*

grass in the last ten years, but in several of which he had left Rye-grass altogether out of his mixtures; and that those pastures which had been sown without Rye-grass had overtaken and surpassed others sown before them with Rye-grass, on similar land.

In replying to this statement, Prof. Fream said he was strongly of opinion that, even on pastures in which Rye-grass seed was not included in the mixtures with which they were laid down, Rye-grass would nevertheless be found, and that he believed, in a great many cases where it was thought that there was no Rye-grass at all on the land, careful examination would reveal its presence.

inferred that No. 2 pasture contained from twice to three times as much Rye-grass as Cock's-foot, and showed that the six-year old pastures of which Colonel Raikes spoke in high terms, contain a larger quantity of Rye-grass than of any other species. *J. J. Wilts, Harpenden.*

EXOCHORDA GRANDIFLORA.

This little known but beautiful Chinese shrub, mentioned favourably by our correspondent, "E. M.," p. 582, in our last issue, and by Mr. Van Volxem in the present one, was originally described

in these columns by Lindley, in 1858, p. 925, and has since been figured in the *Botanical Magazine*, t. 4795. It forms a bush 3 or 4 feet high, with slender, erect, or spreading branches, and thin glabrous leaves. The snow-white flowers are arranged in racemes along the ends of the branches, each about 1½ inches in diameter, with five orbicular petals.

It was introduced by Fortune from Northern China, and has proved hardy in this country. The flowers shown in our illustration (fig. 101) are much smaller than the average. It was well shown as cut specimens from K-w at the last meeting of the Royal Horticultural Society. It is propagated by suckers or layers, and will thrive in any good soil.

CULTURAL MEMORANDA.

WALL-FLOWERS.

THESE should be raised early and given a long season of growth, so as to allow of full development and time for the shoots to get thoroughly ripened by lifting time. Harbinger is a very early flowerer, but there are many others which are excellent also for various purposes, that any selection made by me would not be of much use. The seed should be sown at once on well prepared beds in an open position, treading the soil to moderate firmness before sowing. The drills may be made at 6 inches apart, and when the plants are large enough to be thinned, pricking off at 6 inches apart into nursery beds those which are pulled up, and the strong growing varieties at wider distances. The plants need plenty of water in dry weather, and occasionally, manure-water also. *H. Marshalliana*.

PANSIES.

Plants raised from seed sown in pans in heat, and subsequently pricked off into boxes, will ere this be strong and fit to plant out in the open. Give the bed a good dressing of manure and a deep digging. The finest blooms I ever grew were on a bed that had been manured with cow-dung, this having been put 6 inches under the surface of the bed. The soil was trodden firm and planted. A little soot-water will be found a capital fertiliser, and it gives the foliage a healthy dark green colour. *H. M.*

TREES AND SHRUBS.

BERBERIS STENOPHYLLA.

It seems impossible to say too much in praise of this charming spring-flowering shrub. A repeated hybrid, it would be interesting to know how it originated, and to whom we are indebted for the introduction of such a beautiful subject to English gardens. It is one of the features in the pleasure-grounds at Gunnersbury Park, where it is to be found forming large beds, the branches laden with flowers of a bright yellow colour, produced in small pendulous racemes springing from each of the leafy tufts, and exceedingly numerous. I have a plant of it growing against a west wall in my forecourt garden, on a spot where but little sun falls, and in a soil that tends to starve rather than nourish the plant; the growth is somewhat slow, but each spring it heaps up its racemes of blossoms in happy plenitude. Whether from the weight of the flowers, or from a natural tendency to take this form, the branches become arched and pendulous, which adds to its attractiveness as a decorative shrub. It does not appear to be very particular as to the matter of soil or situation, and, judging from my own experience of it, it is as hardy as a shrub can well be. *B. dulcis* is also a very pretty early-flowering species, and very free of bloom. I am not quite sure if it is as hardy as *B. stenophylla*. *B. Darwinii* completes a trio of beautiful shrubs well worthy of general cultivation. This also flowers in racemes, and they are yellow, tinged with red, abundantly produced, and very ornamental; it is

later in flowering, and makes a splendid group. I think this subject should be more employed in forming hedge-rows in gardens; beauty and utility would thus be combined. For a spray of bloom, see p. 619, fig. 103. The late Mr. A. Mongredien, in his book on *Trees and Shrubs for English Plantations*, pointed out as well worthy of notice the fact that "a large proportion of the known species of *Berberis* are natives of that barren and inhospitable land which, on either side, coats the Straits of Magellan. In that region of cloud and wind, the flora is very poor in number of species generally, but wealthy beyond all other localities in species of *Berberis*. This singular fact cannot arise out of climatic influences alone, as the species of *Berberis* indigenous to that region thrive vigorously when transplanted into England, nor can it be owing to local hybridisation, as the species are all sufficiently distinct." *R. D.*

EXCOCHORDA AND PTEROCARYA.

There is another species of *Excochorda* besides *E. grandiflora*, *E. Albert* (Rege), from Central Asia, which was in the trade as early as 1886 at least, and may be found in good continental nurseries at 1s. 6d. per plant. The old species is perfectly hardy here, and flowers very freely when of a sufficient size and left to itself, but it is never a neat and compact bush. It attains a height of 6 or 7 feet.

Mr. G. Wythes is right as to natural station of *Pterocarya caucasica*; I found it wild in marshes at the foot of the southern slope of the Caucasus, along the river Alazon, near Lagodechi. A little higher up, in less humid soil, are extensive natural forests of *Juglans regia*. This common origin explains why both are so liable to be injured by late frosts, although quite hardy in winter.

There is a fact ascertained lately by myself which I cannot explain, and which is quite unique so far as I know. In the same soil and position, this tree grows either as a large bush 25 to 30 feet high, or as large as a fine Elm, with a high and clean bole. Both forms are entirely mixed up with each other without any intermediary forms, and are perfectly similar in foliage. I propagate it always by layers, which strike very easily, and make much sooner marketable trees than seedlings possibly could do. I never had fertile nuts on my trees, but they can be got sometimes at Erfurt (good or not, I cannot say), at 7s. per lb. I have in my nurseries four species of the genus as distinct as possible, and perfectly hardy—*P. caucasica*, *P. levigata*, serrated shiny leaves; *P. japonica*, and *P. sinensis*, downy leaves. *J. von Volzow, Perok Nurseries, Brussels.*

SPARTICUM JUNCEUM.

The Spanish Broom is very showy just now in shrubberies, and on rockeries near the water, which it overhangs in a graceful manner, reflecting its beauty in the water. It has a strong perfume, yet not of the sweetest; the growth is exceedingly quick, vigorous shoots being formed every year, which never fail to bloom abundantly. As a water-side plant, this pale yellow-flowered shrub is much appreciated. *E. M.*

PRUNUS PISSARDI.

Some mention was made a short time ago of this beautiful shrub. We find it is most useful for cutting, very graceful withal, and good for early flowering, it being about the first to open its flowers. Another fact worth recording is, that it maintains the beautiful purple tint longer in the autumn than any other purple-leaved plant. It will grow in any soil that is in good heart, and in any position, and does remarkably well upon a northern slope, as at this place. *W. A. Cook, Compton Bassett.*

PLANTS AND THEIR CULTURE.

THE INMATES OF THE STOVE.—Closer attention will now be necessary in shading and ventilating, the sun having got powerful, though in May we often get cold winds, which require that airing should be carefully done, always doing it by the ventilators at the top of the house, thus avoiding cold currents.

The evaporating troughs should be kept filled; syringing and damping down frequently to correct injurious dryness. Plenty of moisture should be thrown about at closing time, and again later in the evening, with the view of checking the advance of thrips and red-spider. Allamandas in pots, Bougainvilliers that were started early, and other strong growers will have filled their pots with roots, and begun to flower, at this stage weak liquid-manure should be given them, and the shoots should be trained to the trellis; the Allamandas being kept dry twenty-four hours before beginning to train the shoots. Clerodendrons, as they come into bloom, should be put into a drier and cooler house, so as to prolong the bloom, but still keeping the plants well supplied with water, and all decayed flowers removed. Anthuriums that are full of spathes should be similarly treated, and put into an intermediate-house for a short time. Gloxinias in bloom may be placed in a cooler and drier house to prolong their season of bloom. Crotons will now take copious supplies of water and weak liquid manure, and any ties or sticks required should be attended to before the foliage gets far advanced, and abundant syringing resorted to in fine weather, wetting every part of the plant. Palms should be assisted with manure-water, &c., to give the new leaves strength, especially those of them that are not often repotted.

Bracenas, *Aralias*, and similar plants, that have filled their pots with roots, may be reotted if intended to be grown into large specimens. *Bracenas* soon get disfigured if the foliage be not kept clean, and frequent syringing is necessary to keep them in good condition. When full of roots, daily syringing is necessary. The ornamental-leafed *Begonias* may now be repotted, dividing the roots if stock be required and for a short time after doing this, the plants ought to be kept close, watering them carefully till new growth is made. These are useful decorative plants, and easily grown in smallish pots. *Begonias* strike readily from the old leaves, and soon make useful plants. The stock of autumn-blooming *Begonias* may now be transferred from the cutting pots into 60's if they have been propagated as advised in a previous calendar, placing them when potted in an intermediate house. These species of *Begonia*, if overwatered when short of roots or in a young state, soon show signs of distress, and some degree of care is required in managing them. Most of the plants for the autumn bloom, as *Plumbago rosea*, *Libonias*, *Justicias*, *Lasiandra macrantha*, and *Eranthemums*, need similar treatment to the *Begonia*. A good supply of *Poinsettias* should now be secured, and the old plants which have been kept dry should be placed in an intermediate house for furnishing cuttings, and if placed on shelves short sturdy cuttings will be obtained. Take these off with a heel when from 2 to 3 inches long. When sufficient stock has been secured, the best of them may be cut hard back, and when they break, shaken out, repotted and grown on for early bloom. A few pots of *Euphorbia jacquincella* propagated now, by putting three cuttings round the side of a 60 pot, and once reotting the whole potful later on, will make nice decorative objects; they should be pinched two or three times whilst growing freely. All species of plants which were struck early and require a shift should be attended to. *Thrysaecanthus rutilans* should be secured, for it is a charming winter decorative plant. The useful *Epiphyllum truncatum* will now be growing freely, and should get weak liquid manure frequently; these plants do well on shelves near the light, with free circulation of air. Any repotting required by them should be attended to in the case of small plants, keeping them closer for a few days afterwards. *Geo. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

EAST INDIAN ORCHIDS.—In a previous Calendar, I promised to report at a later date on the effect of keeping *Vanda Hookeriana* in the warmest house during the winter months, and not allowing it to remain dry for any considerable time together, as it is usually treated. I am glad I tried the experiment, for my plants are now sending out spikes in a very satisfactory manner, and more freely than does *Vanda* trees when subjected to the same treatment. *Phaius* (*Thunia*) *Marshalliana* will now be passing out of flower. It is a handsome Orchid when well done, and it is one that is, in too many cases, put away in any corner to take its chance as soon as it has flowered. Nothing can be worse for the

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

NEWSPAPERS. — Correspondents sending newspaper-papers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY, MAY 21. Bath.
Royal Aquarium (two days).

FRIDAY, MAY 23.—Manchester (till 24th).

MEETINGS.

WEDNESDAY, MAY 21. Gardeners' Orphan Fund Fling
at The Nurseries, High Street.

SATURDAY, MAY 24.—Limeau Society Anniversary.

SALES.

WEDNESDAY, MAY 21. Greenhouse and Bedding Plants,
at The Nurseries, High Street,
Watford, by Protheroe & Morris.

THURSDAY, MAY 22. Stone and Greenhouse Plants, at
Bedlington House, Croxley, by
Protheroe & Morris.

FRIDAY, MAY 23. Imported and Established Orchids,
at Protheroe & Morris' Rooms.

SATURDAY, MAY 24. Greenhouse and Bedding Plants, at
the American Nurseries, Lexington;
also at St. John's Park
Nursery, Blackheath, by Protheroe & Morris.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—55° 9.

In a communication to the Royal Society, an abstract of which is published in the last number of the *Proceedings*, Professor MARSHALL WARD discusses certain diseases of plants due to parasitic fungi. In order to understand such diseases, and we must understand them before we can pretend to cure, or even palliate them, Mr. WARD points out that we have to learn (1), the life-history of the fungus; (2), the ways and life-habits of the affected plant; (3), the influence of heat, light, moisture, &c., on parasite and on host-plant. Even then there is (4), an "unknown variable" in the internal changes going on in both the host and the parasite. Practical gardeners are familiar with the climatal conditions which favour the spread of the Potato disease, and at one time they were too ready to attribute the disease in question to the weather, and especially to that mysterious influence known as electricity, which has or had for some minds, till it was displaced by "Bacteria," as great an attraction as the "blessed word Mesopotamia" had for others. It is true doctrine that Professor WARD teaches when he says, that a low temperature, feeble light, and a moisture-laden atmosphere render the plant less able to withstand the inroads of a parasite, because its cell-walls are thinner and more watery, and the contents of the cell in a more unstable condition than under normal circumstances.

Experiments have proved that such plants not only offer less resistance to the fungus threads, but the conditions above-mentioned cause the plant to abound in materials suitable for the fungus. Circumstances then are propitious to the growth of the fungus at the same time that they are injurious to the host-plant. One such fungus, common in greenhouses, causes a sort of "rotten ripeness" in Grapes on the Rhine, and these mouldy Grapes are in some districts used to produce the finest wine, the explanation being that the diseased Grapes undergo remarkable changes, by which the proportion of acid is reduced, and the must of the Grapes rendered richer.

The fungus attacks the plant by destroying first its cell-walls, and then its protoplasm, cell by cell. The destruction is effected by means of a poisonous secretion, which acts as a ferment, dissolves the cell-walls, and kills the protoplasm. So long as the protoplasm can resist the injurious agency exerted by the fungus, by oxidising the poison, or by other means, so long will the plant remain unaffected; but, when once the poison succeeds in overcoming the resistance of the protoplasm, the battle is won, and the intruding fungus revels in the food provided for it.

One point Mr. WARD specially insists on, and that is, that there is no mysterious predisposition to disease; but that while, as before said, conditions are favourable to the fungus, they are prejudicial to the host-plant. "If we wanted," he concludes, "to cultivate the fungus in one greenhouse, and the host in another, we should endeavour to provide one set of conditions for the fungus, and another, and a very different set, for the host."

Cultivators who have not the opportunities nor the time to study for themselves the intricate details connected with the growth of parasites, will be glad to have the general principles so clearly laid down.

HARDY SHRUBS. — As previously announced, Mr. GOLDBRINE, having just returned from India, where he is engaged in making a garden for the Gaekwar of Baroda, read a paper at the last meeting of the Royal Horticultural Society, on the employment of flowering trees and shrubs of a hardy nature for the embellishment of our parks and gardens. He said, in commencing, that the title of his paper was scarcely a correct one, seeing that the flowering period of shrubs that bloom in the spring overlaps that of early summer, and so on, throughout the season. Much will always depend on season, position, and locality. The foreign element amongst our best shrubs was alluded to, and the lecturer very pertinently pointed out how much poorer, and deficient in floral beauty, and wanting in interest our gardens would be if it were not for the exotics we plant in them, and in fact without these, we could not have fine gardens at all. It was to be regretted that the subject had been hitherto treated with neglect by employer and gardener, the result of which is that very few amongst us are so well acquainted with these plants as is desirable. He thought little advance had been made since LONDON'S time, and inclined to the belief, rather, that we had in this respect retrograded. We had now to be taught what to plant and what to avoid. There was one class of the community which had not retrograded—the nurserymen. They saw a change was taking place in the ideas held concerning planting, and were preparing accordingly. He would recommend all who intended to plant something better than the common things one saw in the generality of gardens, to pay visits to nurseries dealing in shrubs and trees at various periods in spring and early summer, and make selections at those times. Buyers would then know what they

were getting, and would know better the habit of the plant, colour of flower and foliage, and obtain data of all kinds that would afterwards prove of value. Proper preparation of the soil was referred to as being an essential, if good results were to be obtained, and thick planting was condemned—that is, of flowering shrubs themselves. The lecturer then went on to deal with the various species and varieties of shrubs and half trees, employing some of the specimens exhibited by the Director of Kew Gardens, Mr. G. PAUL, and others, to elucidate his remarks. At the finish, Mr. NICHOLSON, of Kew, in response to the request of the Chairman, Mr. G. PATR, supplemented Mr. GOLDBRINE'S remarks. As a finger-post, pointing the direction future planters should take, the paper has much value; but so extensive a subject needs fuller treatment than was possible in the time allowed. The various plants which are figured in our present issue were mentioned by the lecturer as being indispensable in gardens.

ROYAL HORTICULTURAL SOCIETY.—His Royal Highness the Prince of WALES has consented to open the Society's Great Summer Show of Orchids, Roses, Azaleas, Rhododendrons, Begonias, Palms, &c., which will be held, by the kind permission of the Treasurer and Benchers, in the Inner Temple Gardens, on Wednesday and Thursday, May 28 and 29. We understand that the catalogue of the show will take the form of a twenty-page octavo pamphlet, comprising—1st, a short history of the Society; 2nd, programmes of the music each day by the Band of H.M. Royal Horse Guards (Blues); 3rd, a list of exhibitors, and of their chief exhibits. But we are requested to state that no names, &c., can possibly be inserted in No. 3 unless they are received by Mr. BAARON, Royal Horticultural Society's Gardens, Chiswick; or at the Society's offices, 117, Victoria Street, on Saturday, May 24, at the latest. Ten thousand of these schedules are being printed.

THE REV. W. WILKS.—The gardening world was startled last week by a statement in the pages of a contemporary, to the effect that Mr. WILKS had resigned the honorary secretaryship of the Royal Horticultural Society, and we are now desirous by that gentleman to contradict that statement. The report has, however, somewhat more truth in it than have most reports, inasmuch as he is very anxious to find some one who will take up the work. The Society may, he thinks, now be said to have turned the corner, and has, he hopes, seen its worst days. He feels, therefore, that he has done his duty by the Society, and that he should now retire, leaving its affairs in a far more satisfactory condition than he found them. A new era, too, is commencing with the prospect of a new hall for horticulture, and therefore it seems to him a most fitting time for a new shoulder to be put to the wheel. At the same time, though on many accounts he is very desirous of retiring into private horticultural life, he has not actually resigned, nor will he do so until a successor is forthcoming, unless more urgent reasons should arise than he is glad to say, at present exist. As to having done his duty, we do but echo the feeling of all who know, when we most cordially and gratefully acknowledge that he has done so to the utmost—that to a very large extent the improved position and prospects of the Society are due to him, and we trust it will be long before the Society loses the services of one who has made himself so essential to it.

THE FLORAL FETE, which has been organised for the benefit of the Gardeners' Orphan Fund, will take place in the Wholesale Flower Market, Covent Garden, on Wednesday evening next, May 21. The Lady Mayoress will open the fete, while the Duchess of BEDFORD, and the Baroness BURNETT CURTIS, have signified their intention of being present. It is to be hoped that the Fund will derive a substantial benefit from the venture. Admission is by ticket, price 3s., and as the number is limited, early application should be made to Mr. A. F. BAARON,

Chiswick, or to Mr. J. ASSBEE, Covent Garden. In connection with the Gardeners' Orphan Fund, we learn with pleasure that SHIRLEY HINBERG, Esq., will preside at the annual dinner on July 19.

"KEW BULLETIN."—The May number contains commercial information relating to Lagos rubber

produce of *Linum perenne*, but little is known of it at present as an economic plant. Liberian Coffee has, we are told, found a congenial home in the Straits Settlements.

THE ROYAL BOTANIC SOCIETY.—The first of a series of lectures on botanical subjects was given in the

in May and June, and will be free to all visitors to the gardens.

TWO-FLOWERED INFLORESCENCE OF *CYPRIPEDIUM*.—So long back as 1866, we remember taking part in a little controversy with Prof. REICHERTSBACH on this subject. We advocated the notion that

FIG. 102.—*MAGNOLIA STELLATA*. FLOWERS WHITE, WITH YELLOW ANthers. (SEE P. 618.)

the produce of *Ficus Vogelii* and other species, and which is well spoken of by Mr. SILVEN. The Alexandrian mealy-bug, *Crossotoma aegyptiacum*, which is doing much harm in Egypt, comes in for a share of notice. Rosin washes are recommended as follows:—Rosin, 20 lb.; caustic soda (70 per cent. strength), 6 lb.; fish oil, 3 lb.; water, to 100 gal. Boil till dissolved, add cold water, and stir. Finally dilute with 100 gal. of water. Siberian flax is the

Museum of the Royal Botanic Society of London on Friday evening last, by Mr. E. M. HOLMES. Mr. H. M. BENT was in the chair. Mr. HOLMES' subject was "British Seaweeds." His interesting lecture treated more particularly of the colours, structure, and modes of growth of the many species common upon our coasts. Living specimens of the more interesting varieties were exhibited. The lectures are to be continued on the Fridays

the structural characteristics were such that branched inflorescences might naturally be looked for as the result of good cultivation and vigour of growth. The Professor considered them as purely exceptional. Since that time plenty of such cases have occurred, and now we have before us, as we write, a fine spike of *Cypripedium Lawrenceanum*, and another of *C. selligerum majus*, grown by Mr. REGINALD YOUNG, Fringilla, Liverpool, and sent to us by Messrs.

SANDER. The original flower-stalk is terminated by a flower, the secondary or lateral one being produced at a lower level, forming an illustration of what botanists call a definite inflorescence. The great peculiarity in these cases, is that although the two flowers belong, as it were, to distinct generations, yet the older flowers preserve their good looks so long that they bear comparison with their younger rivals.

BOUQUETS AT THE DRAWING ROOM.—As it is no longer considered impertinent to publish an account of a lady's dress, there can be no impropriety in copying the following extract from the *Daily News*.—"The bouquets were in great variety and beauty. Some glorious Orchids were to be seen. A posy of white Roses was almost as lovely as any there. The Countess of ARKAN carried a lovely bouquet of Mimosa [?] and brown foliage. The Hon. VIOLET LANK-FIN'S Souvenir d'un Ami Roses were deliciously fragrant. Lady WOLSELEY carried crimson ROSES. Mrs. CORNWALLIS WEST'S pink Roses were mingled with beautiful green foliage. Enormous blooms of giant Mignonette composed another."

LINNEAN SOCIETY.—The anniversary meeting of this Society, for the election of a council and officers for the ensuing year, &c., will be held at the Society's rooms, Burlington House, Piccadilly, on Saturday, May 21, at 3 o'clock precisely.

IRIS IBERICA PARADOXIDES. This beautiful new Iris, writes M. MAX LECHTELIN, turned up among my numerous seedlings, and seems to be a natural hybrid, which, had it been found wild would certainly have been declared a new species. In form it is exactly like *I. iberica*, except the outer segments, which are spatulate with a very broad beard. The colour of the inner segments is pale purple with reticulate markings of very bright shining purple; outer segments stretching out horizontally, slightly recurving, of a pale sulphur-yellow ground colour, which is covered by the broad velvety-purple beard and velvet-black blotch, also a thick reticulation of the same velvet-black. It is just midway between *I. iberica* and *I. paradoxa*, a very striking and showy flower.

SCHOOL OF FORESTRY.—A deputation from the Associated Chambers of Commerce waited upon Mr. CHAPLIN (with whom was Sir JAMES CAHILL) at the offices of the Board of Agriculture, in St. James's Square, for the purpose of urging upon him the desirability of establishing a National School of Forestry. Colonel HILL, addressing Mr. CHAPLIN, said those who were with him desired to point out that the growing of timber as an industry might be most usefully extended in this country, especially in view of the timber supply from abroad becoming more and more diminished. They recommended, therefore, that Her Majesty's Government should establish a National School of Forestry, which would be an encouragement not only to the planting of Crown lands with trees, but would also induce private landowners to utilise ground which was at present of little or no service in the same direction.—Mr. G. HAMPDEN next spoke, and said he had received letters approving of the objects of the deputation from Lord BASING, official vendor of the New Forest, Sir EDWARD LEACHMERE, and other gentlemen. He further pointed out that, with the exception of Spain, this was the only country of any position that did not have National Schools of Forestry. England was the greatest timber-buying nation in the world, and at present imported annually something like £18,000,000 worth of that commodity. There was a vast acreage of land now lying waste in this country which might, were the proper instruction forthcoming, be used for timber growing, and practically enable it to produce all the timber it required.—Mr. CHAPLIN said there could be no doubt of the growing interest and importance of the question under discussion. The purport of the remarks he had heard seemed to be that his department should establish a National School of Forestry. He desired, however, to point out that the Act

under which that department was instituted provided only for its inspecting and reporting upon schools which provided education either upon agriculture or upon forestry. So far as he could see, his department had no power to institute a school, but he would consider the matter very carefully, with a view to seeing if he could recommend such a course to the Government. Before he did this, however, he should like to obtain some further information upon the climate and soil of the waste land which Mr. HAMPDEN had said it would be possible to turn into profitable forest land.

SEATS AND GARDENS FOR THE WEARY.—The Metropolitan Public Gardens Association have granted £50 for seats for St. James's Churchyard, Clerkenwell. They are in communication with the Ecclesiastical Commissioners respecting certain lands in Fulham; with the Corporation as to the Hill fields, S.E.; and Wandstead Flats; with the First Commissioner of Works respecting banks of flowers for Trafalgar Square; and with the Corporation of St. Bartholomew's Hospital asking that Bartholomew's Square may be opened to the public. It was reported at the last meeting of the Association recently that the Vestry of St. James's, Westminster, had undertaken to maintain the shrubs at Piccadilly Circus; that the Association employ had improved for the public use a small ground attached to the Victoria Docks Congregational Church; that the Vestry of St. Martin's had agreed to maintain the garden round the church of St. Martin-in-the-Fields, which the Association laid out and has maintained for the past three years; and that the Charity Commissioners had received a deputation respecting the preservation of Emmanuel Hospital, Westminster, and the space adjoining it.

THE HORTICULTURAL HALL. From the list of gentlemen who have subscribed money for the above building, which was published in the *Gardener's Chronicle*, April 26, the nursery firm of DICKSONS (Limited), Chester, was inadvertently omitted. The list, however, was professedly incomplete.

THE SILK TRADES' EXHIBITION, to which we drew attention at p. 555, has proved very successful. The ball-room at 7, St. James's Square, kindly lent by Lady EDGEMOND or TAYLOR, is not quite the place for such an affair, the exhibits suffering from lack of space and occasional lack of light. A well-drilled band of lady mandolists, and a loom at work, gave the necessary life to what might otherwise have been a dull affair. Where there was so much excellence, it would be invidious to distinguish. Many of the exhibits were simply superb, the colours and shades being very pure. Floral effects were aimed at by nearly all the exhibitors, cleverly achieved in some instances, in a few cases, originality of a wonderful character being shown. It is a pity that so much was hung literally on the line, the effect in several cases being quite undesirable. One or two brackets of a high class were crowded out, and had to be pulled out and spread, in order to get a fair view of their fine design. Some of the work most admired was in imitation of the French temple, Louis XVI., also of Genesee velvet. One or two court dresses were of English style, with just a thread of French taste running through them. The faults of the present exhibition will easily be deleted from any succeeding one, whilst all its beauties ought to be retained.

MAGNOLIA STELLATA. In this fragrant white-flowered shrub (fig. 102), a native of Japan, we have a lovely addition to the spring flora. The flowers, which are 3 inches across, with yellow anthers, expand before the foliage is fully developed—that is from March to May, according to position and locality. Under the name of *M. Halliana*, given to it in compliment to its introducer to the U.S. of America, it was figured in the *Garden* (vol. xiii., p. 15). The plant has been long cultivated in Japan, and it is said by FRAXCOURT and SAWALIER to be indigenous in woods around Mount Fusi Yama and in Central Nippon, where it forms a small tree. The leaves, which grow from 2 to 5 inches long, are variable in shape, from narrowly obovate with rounded tips, to elliptic and acuminate, and membranous, the petiole about one-third of an inch long. The petals number about fifteen, spreading at first, and becoming reflexed in a day or two after opening, and have a faint pink central streak on the white ground. It is a plant

which every one with a sheltered garden should grow, and it will succeed as a bush or as a wall tree. The plant was recently in flower at Messrs. J. VEITCH & SONS' nursery, Coombe Wood, but the specimen figured was sent by Mr. J. O'BRIEN. It is figured in the *Botanical Magazine*, t. 6379.

CATASETUM BUNGEROTHII.

M. LUCIEN LINDEN writes with reference to this plant, which is considered in the last number of the *Reichenbachii* to be *C. pileatum*, of Reichenbach:—

"Permit me to protest against the name *pileatum*, which Reichenbach is said to have applied to this plant so long ago as 1822. Some time before his death, the Professor wrote to me that the *C. Bunge-rothii* was the same species that we had sent to him in 1822, and which he had then named *C. pileatum*. In reply, I told him that neither my father nor myself had at any time sent him a *Catasetum* at all like *C. Bunge-rothii*. This assertion I now repeat. I cannot remember what *Catasetum* we may have sent to the Professor, but I am quite sure it was not *C. Bunge-rothii*. This species is so extraordinary, that my father and myself must have recollected it."

Catasetum pileatum was described in these columns by Professor Reichenbach on April 15, 1822, and was again described by him, November 13, 1826. What Reichenbach said of his *C. pileatum* in 1822 reads rather tautly in comparison with the sensation that *C. Bunge-rothii* excited when it first appeared in London.

A curious species, comparable to *Catasetum cornutum*. It has rather large flowers, comparable to those of *C. Nanso*. Sepals narrow, light reddish. They may, however, have been green before, as sometimes is the fact, from withering. Petals broad, oblong acute, white. Lip a wide, nearly obtuse-angled expansion descending in a blunt cone, white, Column with a very long beak and two cirrhi. This interesting species was introduced from Venezuela by Director Linden, and flowered by the Compagnie Continentale d'Horticulture, Société Anonyme, Gand."

On November 13, 1826, as above stated, the Professor again described a plant under the same name and as a new species in our columns, without any reference whatever to his previous description. Could he possibly have forgotten that he had already described the (or a) plant under the same name more than four years previously? The second account runs thus:—

"A curious species, which in the breadth of the lip, the ivory broad lip, the whitish colour reminds one of *Mormodes luxatum*. It has rather large flowers like those of that plant. Sepals narrow, large, bilobate-acute, light reddish. I am, however, by no means sure whether the colour is natural, or a consequence of withering. Petals broad oblong, acute white. Lip a wide, nearly triangular, obtuse-angled expansion, descending at the base into a blunt cone. Column white, with a very long apical beak and two well-developed cirrhi. A specimen has been kindly sent to me by Messrs. Linden."

This second account, and especially the reference to *Mormodes luxatum*, gives a better picture of *C. Bunge-rothii* than did the first one, but still the omissions are very noteworthy.

On December 16, 1826, as the *Gardener's Chronicle* was going through the press, we were summoned in hot haste to Stevens' Rooms to see a most wonderful *Catasetum*. There we found a plant sent for sale by Messrs. Linden, and of it we took some notes which were published at p. 785 of our volume for that date. We were the more struck with it as we had, if we remember rightly, previously seen the original sketch made by the collector; at any rate, we must certainly have seen the reproduction of it in *Lindena*, published early in 1826, and we had had some conversation about it which Mr. N. E. Brown, who described the species, as we thought at the time from rather unsatisfactory material. In any case, the plant was a far finer thing than the picture represented it to be.

On January 29, 1887, we published a full page illustration of this species taken from the first plant which flowered in this country, and which was in the collection of F. G. Tautz, Esq. At the same time we also published from our own memoranda a further description of the first plant seen in flower in Europe, and which was the one sold in Stevens' Rooms to Baron Schroder. We prognosticated the existence of considerable variation—a prognostic which has been amply verified.

This figure was, we believe, the first representation of the plant, except the rough memorandum sketch made by Bunge-roth, published in the *Litobota*. We mention these dates and historical reminiscences because, although in constant correspondence with the Professor, it is remarkable that he should have allowed us to publish this illustration and these memoranda without having called our attention to his previously published *C. pilatum*. He appears, however, to have stated the fact to M. Linden, and to have apprised Mr. Sander that "Baron Schroder has sent me, through Ballantine, an enormous spike of *Catasetum pilatum*." This last letter was dated on August 8, 1887, the spike alluded to being taken from the same plant that was shown in Stevens' Rooms.

In October, 1887, p. 331, the flowering of *Catasetum Bunge-rothii* at Kew was noted, and subsequently numerous references have been made to the plant, always under the name Bunge-rothii. Under this name also it has been figured in the *Flowering Herbarium*, 1887, t. 10; *Botanical Magazine*, t. 6298, 1888, *The Garden*, 1888, p. 388, and the *Globe Album*, viii, t. 372.

According to Mr. Rife, who retains the name Bunge-rothii (see *Gardener's Chron.*, October 26, 1888, p. 165), specimens of this *Catasetum*, collected by Spruce, had lain unrecognized and unnamed for more than thirty years in the Kew herbarium. It is remarkable, if this be so, that it should have escaped the lynx-eyed scrutiny of Professor Reichenbach; but this may have been because it was mis-placed in some other genus.

In the case of so very distinct, and so well known a plant, the confusion arising from the dual name is not likely to be so inconvenient as in the case of more obscure and less well known plants. We, or our successors, can well afford to wait patiently till the Professor's herbarium is unlocked a quarter of a century hence at Vienna, to ascertain for certain what it was that Messrs. Linden sent to him, and it may prove that established custom may, as it often does, prove more potent than the laws of priority.

Lastly, we would call attention to the notes on the sexual variation of these plants by Mr. N. E. Brown, April 13, 1889, p. 361, fig. 83, and by Mr. Rife, at p. 167 of our number for October 26 of the same year, and to the highly important observations of the latter gentleman before the Linnean Society, March 21, 1889, as reported in our columns March 29, 1889, p. 197.

BERBERIS STENOPHYLLA, X.

This species of *Berberis*, fig. 103—a hybrid between *B. Darwinii* and *B. empetrifolia*—is a graceful evergreen shrub of drooping habit, covered in the spring with wreaths of golden blossoms, and in the autumn less so. Like others of the genus, it is well adapted for groups, borders to beds of shrubs, or for clothing a low fence. It is easily propagated by layers by cuttings in a cold frame, and by seeds—the commoner method of increase in nurseries. (See p. 614.)

OLEARIA GUNNIANA.

OLEARIA GUNNIANA is a Tasmanian shrub, long known in gardens under the name *Eurybia Gunniana*, but as *Eurybia* cannot be generically separated from *Olearia*, the older name must give place to the one given above. The plant grows from 3 to 1 foot in height, with hoary branches and polymorphous leaves, which are oblanceolate, coarsely

toothed, and hoary beneath. The starry, white flowers are very numerous, and cover the ends of the branches with a snowy sheet. The flowers, represented in our illustration, p. 623, of their natural size, have white ray florets, and a grey disc. In sheltered situations it will stand out-of-doors uninjured in our usual winters, although in very severe ones, and in cold situations, it may be preserved from injury by a small amount of protection.

About London this shrub is often found, smothered with bloom in the spring months, and it is un-

AMELANCHIER VULGARIS.

The *Amelanchiers* are amongst some of the best of ornamental hardy deciduous shrubs of large growth, which no planter should omit to plant, either as specimens on the lawn, or in the back runs of the shrubbery. The tree is common in Switzerland and other European countries, in the former country clothing the hills in April with its snowy plumes (see fig. 104, p. 624). The leaf is roundish oval, pubescent beneath whilst young, and becoming glabrous with age. The foliage of *A. vulgaris*, like that of the American forms, assumes reddish tints in the autumn, and this is another point of attraction possessed by the plant.

It is not fastidious as to soil, provided it is not very poor or clayey, and is well trenched and manured previous to planting.

It is propagated by layering in the spring, and by cuttings taken in the autumn. The name is Savoyard for Medlar, to which this genus is allied.

HOME CORRESPONDENCE.

PASSIFLORA CÆRULEA, CONSTANCE ELLIOTT.

The above variety will repay for any trouble bestowed on its culture. Every one is familiar with the long pendulous shoots of *Passiflora cœrulea*, and we have only to imagine a white form of this beautiful flower. I have a plant growing on the roof of the Rose-house over the pathway that has been in flower for two months past, and has at the present time one hundred of its white-scented blooms. It continues to grow and form blooms, and on most of the shoots there are twenty-blooms in every 2 feet, and each bloom measures 3½ inches in diameter. For cutting, for festoons, and for the use with artificial light, it is an acquisition, and for church decoration it is equally good. The flowers keep fresh for a long time in water, and it is well to remind floral decorators that bottles of water should be placed somewhere out of sight, to put the stems in. Although a hardy plant, it is just the thing for lofty cold conservatories, where, after the main shoots get established, the shoots may be allowed to hang down in general fashion. I feel sure anyone planting this variety will not regret having done so. Wreaths are very pleasing made with it, and it is well adapted for such purposes, for although the stalks are not very long, the blooms themselves may be wired, and so made use of. I shall try some small plants for early forcing during the coming season. Cuttings of the plant root readily. *A. Evans, Lythe Hill.*

WALLFLOWERS. No time should be lost in sowing seed of approved varieties of Wallflower for flowering twelve-months hence. Hubing r, crimson, and Cloth of Gold, bright yellow, are two very effective varieties to grow. The seed may be sown in shallow drained boxes, filled nearly to the top with fine light mould, made firm and covered lightly. The boxes should be placed in a frame or pit, and watered with a fine rose, shaded and kept close until germination takes place, when full air and light must be afforded them. Wallflowers ought to be pricked out as soon as large enough at about 6 inches apart. The only after attention necessary until planting out time arrives in October, is to keep them supplied with water at the roots and free from weeds. If a layer of rotten dung, 1 inch thick, be placed on a hard bottom in a sunny situation, and over this a like thickness of fine loamy soil made firm, and the young plants dibbled into it at the distances indicated, making the soil pretty firm about the roots, and afterwards watering them through a fine rose to settle the soil, the plants will not only grow well, but also lift and transplant well, with nice balls of soil, and manure attached to the roots. *H. W. Ward.*

LONGFORD CASTLE.—To the already extensive glass here, there has recently been added a large and substantial lean-to house, 100 feet long, 42 feet wide, and the same height at the back wall. The back wall, I may mention, is well furnished with trained fig trees, and Tomatoes are trained half way up the roof on a wire trellis. The roots are restricted to a narrow border, which runs the entire length of the house, and is bordered by a brick wall. Sutton's Perfection is the principal variety grown. The heating apparatus consists of two 4-inch down-pipes, being fixed close up to the ventilators. There

FIG. 103. BERBERIS STENOPHYLLA, X. DOUBLE YELLOW.

doubtfully a town plant, although the flowers get smirched with 'black.'

Of *Olearias* eighty-five species have been described; of these, sixty-three are Australian, and the remainder natives of New Zealand and the neighbouring islands. *O. Hoastii*, white, flowering in dense subterminal hoary cymes, is undoubtedly hardy in this country, and is a dwarf shrub everyone should grow. A native of New Zealand, and figured in *Botanical Magazine*, t. 6592.

is one return-pipe down the gangway. The 3-inch wide cross-pieces of the lattice-path, usually nailed on the sleepers at right angles, are in this case placed diagonally, which makes the walk much easier to the feet. The roof is constructed of T-iron rafters, and five panes of glass (each 35 inches by 13½) to each length of rafter, and embedded in putty, none being used, however, on the top. Lengths of three-quarter inch gas-pipe are used as supports, and are placed at or about 8 feet apart. The top and front ventilators are efficient, and good provision has also been made for water supply. For this a large tank covered with lattice-wood has been built in the centre of the house for the reception of roof-water. A colonial pump is fixed close to the tank, so that water may be pumped up from the earth when necessary. In addition to the above structure, there is also a capital range of four Orchid-houses, made of Pitch Pine. Robinson expansion joints have been used throughout. Mr. Ward, the gardener, is his own architect in both cases. The grounds, too, have been considerably extended and beautified within the last twelve months. 18 acres having been enclosed from the park. Avenues and groups of *Acaecias*, *Laburnums*, scarlet Oaks, copper Beeches, &c., have been planted, and new ferneries made and planted with British varieties. Several new summer-houses have been added, and pleasant peeps and surprises are provided in various parts. The present Earl and Countess of Radnor, it is gratifying to note, take a great interest in the gardens. In conclusion, I would mention the large vineries, pineries, and other fruit-houses, are full of promise, while the garden throughout is a model of cleanliness. *Visitor*.

STRAWBERRIES.—If practical criticisms have any value with respect to new Strawberries, they point to the conclusion that we have these fruits as good as Nature can produce them, and beyond that we shall not go. When we remember the many kinds which have been not only certificated from time to time, but have also been put into commerce, it is surprising to find how few of those introduced during the past twenty years have succeeded in finding a permanent footing in gardens. If we take Hélicart de Thury, Keen's Seedling, President, Sir Joseph Paxton, Sir Charles Napier, and British Queen—in spite of the latter's comparative shyness in some soils—it yet must be conceded that there is not to be found another half-dozen sorts which can touch them, be they old or new. I commend this fact to the promoters of the Congress on Soft Fruits, to be held during the ensuing summer. The cleverest essayist in the world can tell us nothing new about the cultivation of the Strawberry, but there may be room for wider information. As to the methods of raising sorts, which shall exhibit undoubted excellence beyond what is already found in older varieties, that is, of course, assuming that such a thing be at all possible. The undoubted failure of so many very highly-praised sorts, after they have been subjected to practical cultivation in many districts, and in divers soils, shows that raisers have been on the wrong track. If we have fine fruits, they are comparatively flavourless, or are so soft as to be useless for travelling, or show demerits of some sort, and may not be employed to out other older varieties. That we generally prefer for all ordinary purposes the old sorts above-mentioned, shows that the preference must have a solid foundation. It does, therefore, seem obvious that in Strawberry raising we have about reached the end of our tether. *A. D.*

—Having read the correspondence relative to the merits and demerits of Strawberries for forcing in your last week's issue, it may interest some of your readers to know that I am growing a few of the following varieties in pots, in a temperature of 55° to 60° at night, with a gentle circulation of air:—Noble, Jubilee, British Queen, Paxton, Preston Seedling, and Vicomtesse Hélicart de Thury. I find Noble and Jubilee by far the best crops. *Joseph Meredith, Oak Road, Tinnywell, Allenton, Cheshire.* [No one has denied its being a good cropper, Ed.]

—It would, I think, after all that has been said in favour of different varieties for forcing, seem as if the soil and climate have much to do with flavour. I shall grow no more of Laxton's Noble indoors, as the flavour is poor and the flesh dry and woody; this, however, will not stay my growing it outside, where it is early, large, and of passable flavour. I have had fruit indoors 1 oz. each this season, and very fine in colour, but that is all. I was pleased to see Mr. Coulmer speaking lightly of Vicomtesse. My early house

this season was devoted to that variety, with the exception of a few Nobles, and no finer fruits could be wished for; and the flavour, although not A 1, as is the case with most early forced fruits, was excellent in comparison with the others. President, as a successional variety, does not do so well here as at Burchley and Longford Castle, in both of which places it used to be a grand fruit. Our favourite is Sir C. Napier, and I annually force 1200 of that variety. It is a capital variety to travel, the flesh being firm, although not so sweet as some. I send you a few fruits and leaves, and I think you will agree with me that they are good in all points. *H. Merkle, [A very fine sample, Ed.]*

CAPTAIN STRAWBERRY.—To the best of my recollection, I have never said that the Captain Strawberry fruits grew in the autumn. Mr. Laxton credits it with that pleasant habit, but on this soil, although a strong grower, it never even blooms for the second time in one season; neither do I think it a good Strawberry, except for market purposes. It is a large and handsome fruit, as well as an early one, robust of growth, and of strong constitution, so far as present experience goes; therefore I am inclined to doubt whether Noble, although rather earlier, will ever supersede it. *R. D. Blackmore.*

STRAWBERRY LAXTON'S NOBLE.—The above is, no doubt, one of the finest, if not the very finest, looking Strawberries grown. On the 17th of last month, I saw eighteen fruits whose weight was 17½ oz. These fruits were grown by Mr. S. White, gardener, Cannon's Park, Edgware, and were finely coloured and of perfect shape. Mr. White started with only twenty-five plants last autumn, and all these plants were heavily cropped. My own experience of it is, that it is very free, and grows well, but the flavour is bad. Every care was taken with it; it grew side by side with other varieties, but all to no purpose. *Elvina Beckitt, Aldenham.*

ANEMONE FULGENS.—A clump of this Anemone, which has flowered annually for the last ten years, commencing in January, is now (May 2) showing a few straggling open flowers. The 18th of frost we experienced on March 4 checked the plant for a time, but since then they have been much finer than was previously the case. Once only in the time named have the roots been moved. The clump is growing at the front of the herbaceous border, facing south. The soil is strong, stony. It is the adhesive nature of the soil, and non-removal for so long a time, which may be the cause of the long continued vigour of the clump of plants. *E. J.*

STURMER PIPPIN APPLE.—I send a specimen fruit of this Apple (a very fine one, but flavourless, Ed.) to show how late Apples will withstand frost. This Apple was not gathered until November 29 last year. It withstood three rather sharp frosts—the first of 12°, the second of 13°, and the third frost of 14°. I have found if this Apple be gathered too early, it will shrivel and shrivel in the spring of the year. *Robert Smith, Yalding, Kent.*

SPRING TINTS.—Your leader, p. 584, on this evergreen subject, must have been of great interest to your readers. You only do late justice in insisting on the share the leaf-scales have in the *ensemble*. In Spain and Portugal, the ruddy tints of the leaf-scales in the Sweet Chestnut woods are seen from afar, and give a beautiful colour contrast. One view near Cintra, seen in April, of a Chestnut wood trending down the slope of the hill on which is situated the Cork Convent, where as Byron has it

“Honorus long did dwell
In hope to merit Heaven by making earth a Hell,”
will never be effaced from my memory. At the foot of the hill, merging into the muddly glow of the opening Chestnut leaf-buds, were some bright-green strips of foliage, and further on still was the grey of the Eucalypti, whose tall waving heads lined the high road, and the darksome green of the Stone Pines on the sandy flats of Collares. Another prospect, although it did not depend entirely for its loveliness on spring leaves, still clings to me. Near the fountain at Cintra, by which in the mid-day heat there is always resting a picturesque wine cart with its team of yoked oxen, is a steep declivity thickly strewn by Judas trees with a small wood at the base. The lovely contrast between this long stretch of bright purple and the shimmering emerald leafage of the trees below, held one spell-bound. Two instances, where the grouping of the trees seems almost as if it

were planted for the “merry month of May,” occur to me at home. One is the drive from Wolverton Station to Sandringham, over what used to be bare moorland; and the other the long approach through the park to Eaton Hall. The former is quite the prettiest part of the Prince's estate at this time of the year. The plantations chiefly consist of Larches and Corsican and Austrian Pines. The contrast between the two shades of green and the brown soberer tints of the Ling, forms a most attractive picture. *C. A. M. Curranhal.*

AUCUBAS UNDER TREES.—In the gardens at Guncubersbury House, I observed the variegated Aucuba growing satisfactorily under a large Horse Chestnut tree. The plants were about 1 foot high, and the ground was thickly covered, the branches having been pegged down to form a close covering. The effect was as good as could be desired. Those who find a difficulty in getting plants to grow on bare places under trees would do well to make a note of this. The Aucuba, being easily raised from cuttings, no difficulty need be experienced in obtaining a stock of the plants. *E. M.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, May 13.—The above meeting, favoured with fine weather, which brought numerous visitors, took place in the Drill Hall, James Street, Westminster. The display was both a varied and a bright one, and was mainly contributed by exhibitors residing at long distances from the metropolis. The Pansies of Mr. Forbes, of the Ilwack Nurseries; the single and double-flowered Peonies of Messrs. Kelway & Sons; Mr. Ryder's *Primula Sieboldii*, were brilliant in colour, and large in quantity, and took up a considerable amount of space.

New sent a most interesting collection of flowering shoots of hardy shrubs, which well served to show what a wealth of beauty remains still to be utilised before our gardens can be said to be well-furnished. Many of the specimens were utilised by Mr. W. Goldring in pointing his lesson on the employment of early flowering shrubs in the garden. Of this lecture it may be said that, owing to the extent of the subject, the lecturer was only enabled to touch but little more than its fringe, indicating some of the showier plants which plants ought to make use of, beginning with arborescent forms and descending to shrubs. We allude to the paper a little fuller on p. 616.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. R. Dean, B. Wynne, H. Herbst, T. Baines, C. T. Druery, H. B. May, W. C. Leach, Ed. Maxwell, H. Cannell, R. B. Lowe, L. Castle, G. Paul, H. H. D'Oraim, W. Holmes, and G. Nicholson.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., contributed some good specimens of *Ledum buxifolium*, with rosy flowers; *L. latifolium*, with whitish-yellow flowers; and *L. palustre*, with flowers of pure white, and of good size. *Cydonia japonica* Moerloosii was a showy object, by reason of the large size of its blossoms of rich red; also *Enkianthus campanulatus*, a hardy Japanese shrub, with fascicles of pendent, brown-red, bell-shaped flowers. There was a variety of *Azalea mollis*, with flowers of “old gold” colour; and *Cytisus scoparius* Andreanus, a variety which has the wings of the flower of a rich red-brown colour—very showy. Sir Trevor Lawrence, Bart., M.P., also had a specimen of this shrub. A few Cactaceous plants also came from Messrs. Veitch, among them being *Phyllocactus Rose* Perfection, with moderate-sized flowers of rich rose. In P. Admiration was a large and beautiful bright crimson-carmine, and decidedly showy flower. *Epiphyllum Gaertneri* with a good number of flowers was also shown. Giving variety to the flowering shrubs and also illustrating what picturesque effects may be had from foliage alone, were two Conifers, also from Messrs. Veitch, viz., *Picea excelsa* nutabilis, with the pendent young growths of pure yellow; and *Juniperus canadensis aurea*, which also showed yellow buds, the plant is a dwarf and spreading bush.

A showy seedling *Anthurium*, with dark crimson varnished spathe, and yellowish-white, green-tipped spadix was shown by Mr. Bain, gr. to Sir Trevor Lawrence, Barchford Lodge.

A new variety of *Regal Pelargonium*, Duchess of

Buccleuch, was exhibited by Mr. Forbes, Hawick, N.B. It was semi-double and pure white, a useful flower, if free.

Mr. G. Prince showed his new Rose *Souvenir de S. A. Prince*, a nice white Tea-scented variety, but without the points that will make it anything more than a garden Rose. Messrs. W. Paul & Son, Waltham Cross, showed their new Tea-scented Rose, *The Queen*. It is a flower prettily formed, a good

for its novel colour—light purple. Some bedding Pansies in a variety of self colours, came from Swanley, but they paled before the Scotch flowers shown.

Mr. J. Forbes, who came all the way from Hawick, set up a very varied collection of fancy and show Pansies, Violas, &c. in plants, bedded in moss in charming variety. Of fancies, the best were:—W. Dean, John Cooper, John Sutherland, Mrs. E. H.

was both opportune and of value to those who possess gardens in or out of London, and who may desire to render them as beautiful as may be from early spring to midsummer. The collection, as befits Kew, was richer in species than varieties, and we will name some of those which are showy, beautiful, and indispensable: *Amelanchier botryapium*, *A. asiatica*, *A. canadensis*, *A. vulgaris*, all of them white-flowered;

FIG. 104.—AMELANCHIER VULGARIS. FLOWERS WHITE. (SEE P. 619.)

bouquet bloom, and white. They showed also a Tea Rose, the *Danmark Queen*, a flower bearing great resemblance to *La France* in colour and shape, but wanting the silvery sheen of that fine Rose.

The show of cut blooms of zonal, decorative, regal, and show Pelargoniums, set up by Messrs. Cannell & Sons, Swanley, were of exceptional good quality. The double whites, *Bush Hill Beauty* and *Cannell's Double*, are capital regals. In Shows, *Sultana* is a beautiful crimson flower with a white wire edge and white centre; *Mrs. J. C. Stone* is a light purple zonal Pelargonium, deserving of mention

Wood, Acme, and Display, all excellent. Of show or English Pansies, chiefly selfs, were: *George Murray* and *Tom Bates*, yellow; and *Alexander Scott, Sparkler*, and *Major-General Stewart*, blues of deep hue. Bedding Violas included *Countess of Kintore*, bicolor; *Virginalis* and *Gipsy Queen*, white; *Blue Cloud*, white, edged blue; *Archie Giant*, deep blue; and *Abercorn Gem*, creamy-white. The Violas were not so good as we have seen from other sources, but the Pansies, in spite of long carriage, were admirable.

The collection of flowering-shoots of hardy shrubs

Cyrasus avium and *C. avium* il.-pl.; *C. punctata*, from the U.S.A.; *C. Mahaleb* *chrysoarpa*, *C. oxycarpa*, also white-flowered; *Choisya ternata*, *Exochorda grandiflora*, white; a pendulous variety of *Cytisus oxyanthoides*, *C. coccinea glutulosa*. The collection was rich in *Pyrus*, viz., *P. arbutifolia*, *P. serotina*, white flowers, with the reverse of petals of a shade of pink; *P. sorbus*, *P. Maudslayi* *superba*, scarlet; *P. floribunda*. *Azalea amena*, purple flowers, numerous and small; *Cytisus precox*, *Malus microcarpa*, *Viburnum cotonifolium*, *V. lan-tana*; common Broom, and the brown and yellow

variety—*Cytisus scoparius* Andreanus, C. albus, C. ruthenicus from the Caucasus; *Magnolia speciosa* var. *Sonlangiana* M. purpurea; *Ribes sordidum*, a yellow-flowered Currant; *Lodum palmate*, and *L. p. latifolium*, the minute rose-flowered and pretty *Leptochlamys hexifolium* from the eastern U.S.A.; *Piptanthus nepalensis*, a yellow-flowered Broom-like plant; *Rhododendron Kewense*, a bluish-colored showy flower, and its white variety; several richly-colored *Lilacs*, as *Camille de Rohan*, *vulgaris rubra*, and *vulgaris insignis*—all of them being better to plant than the common pale-colored variety.

The erect-growing *Clethra Welwitschiana* is a distinct-looking *Furse*, of free-flowering habit, better fitted for small groups and borders than the common species.

An extensive collection of Tree Peonies was contributed by Messrs. Kewley & Son, Langport, Somerset, the majority were double varieties, and many were very fine, showy, and of large size too. An elegant flower was seen in the single variety named *Beatrice Kewley*, the petals being of a pure satiny white, while the golden stamens arranged themselves round purplish stigmas, making a very pleasing combination of colours. Of the double varieties, we may name *Reine Elizabeth*, bright rose, *ocellata* purple at the base fading to pink, and very full; *Lumen*, like the foregoing, but more compact and solid; *L. Mouchalet*, salmony-rose, rather ragged in appearance; *Jura*, purplish-mauve, intense at the base—a very pretty, full, and heavy flower; *Fascinatus*, flesh colour, with distinct guards almost white. Single Peony *clinalinis splendens* was noticeable for its deep crimson colour. Other cut flowers were also staged, among which were *Pteridium Albert Victor*, rich carmine, single; *Eurybia Gunnii*, *Clinanthus punicus*, *Aponogon distichum*, *White Lilac*, *Trollius europæus*, &c.

An interesting lot of cut specimens was sent by Messrs. Paul & Son, Chesham, in which a number of well-known flowering plants were included, as *Cydonia japonica*, and its white variety, *Staphylea colchica*; several varieties of *Lilac*, *Ribes aureum*, *Double Cherry*, also the double white and pink forms of *Cerasus pseudo-cerasus* (= *Sieboldii*), *Wisteria sinensis*, *Ghent and mollis Azaleas*, *Deutzia gracilis*, *Daphne cneorum*, *Mulds spectabilis* (a pretty and very free-flowering shrub), *Cytisus scoparius Andreanus* (already described), and *Magnolia conspicua*. Among plants were *Elaeagnus macophyllus*, *Juniperus canadensis aurea*, *Clematis montana*, and a fine standard specimen of *Azalea mollis* Consul Fitcher. Cut shoots of various ornamental-leaved plants were shown, as the Golden Elm, several forms of the elegant Japanese Maples, than which nothing is more charming, and a variety of *Ayer* (probably pseudo-platanus), named *Prince Hendery*, the young leaves of which are red-brown, with the veins of clear Apple-green.

Mr. E. Hooper, Vine Nurseries, Wilcombe Hill, Bath, contributed a large number of Pansy blooms of fine strain, and also specimens of a pure white Pink named *Her Majesty*.

Numerous Pansies and also some handsome varieties of their strain of *Primula Sieboldii* were staged by Messrs. Ryder & Son, Sale, Manchester, one form of which, viz., *Alba magnifica* was very handsome; it is pure white, large, and the petals heavily fringed.

Messrs. W. Cutbush & Son, Highgate Nurseries, Highgate, London, N., sent a few plants of *Leschenaultia biloba major*, with a fair amount of bloom, and also *Lunaria biennis variegata*, which has leaves of green and white.

Some excellent pots of *Lily of the Valley* came from Mr. Poupert, Twickenham. Mr. R. Dean, Ealing, W., sent a few Alpine Auriculas, of which *Emir*, an intense brown maroon self with a gold centre, was the best.

One plant which received a considerable share of notice was a *Richardia* shown by Mr. G. Knight, Farnborough Park Gardens, Farnborough, and named by him *Elliottiana*. The spathe is of a beautiful rich yellow colour, and the whole plant has the general appearance of *R. athiopica*, and the green leaf has numerous irregular translucent spots; but what ever the plant may be, it is decidedly a pretty thing, and the colour of the spathe is most pleasing.

Messrs. F. Sander & Co. had a plant of *Blandfordia nobilis imperialis*, which had bell flowers of large size, bright orange-red, with yellow margins. From Mr. J. Measurs, Esq., Cambridge Lodge, Stratham (gr. Mr. Simpkins), came a pure white *Pelargonium*, Miss F. Measurs. Messrs. Barr & Son, 12, King Street, Covent Garden, W.C., sent a group of *Narcissi*, very good for this late time of

the season; and also various Parrot Tulips, Anemones, Irises, &c. Mr. J. Hudson, Gunnersbury House Gardens, Acton, sent a branch of *Cercis siliquastrum*, well laden with flowers. Messrs. Hillebrand-Denis & Co., Angers, France, had *Anemone coronaria* varieties, which were of no particular merit, and not so fine as the "St. Bridz" strain.

Mr. R. J. Lynch, Cambridge Botanic Garden, sent a few remarkable plants in *Aristolochia ringens*, which has two long lips like *A. ornithocephala*; the colour is pale green, marbled with black-brown, and the whole flower about 8 inches or more in length; *Arisarum Hookeri* var. *ringens*, dull brown; *A. proscleum*, which has the spathe drawn out into a long brown beak; also *Baccharis patagonica*, an evergreen shrubby composite; and *Nevisia clabamensis*, with leafy sepals. None of the foregoing, however, except, perhaps, the *Aristolochia*, are of great horticultural interest.

Orchid Committee.

Present: Sir Trevor Lawrence, Bart., M.P., in the chair; and Messrs. S. Courtauld, H. J. Veitch, F. Sander, H. M. Pollett, C. J. Pilcher, J. Dornay, E. Hill, J. Douglas, A. H. Smees, H. Williams, H. Ballantine, T. B. Haywood, J. O'Brien, and Baron J. H. W. Schroder.

There was no specially striking plant shown here, although exhibits were fairly numerous. Mr. G. Wythes, Swan Gardens, Brentford, contributed a group of eighteen plants of good *Cypripedium barbatum*, well-grown examples in perfect health, for which a vote of thanks only was given. Mr. Quaserman, gr. to A. S. Smith, Esq., Cobham, Surrey, sent a plant of the same species.

From W. C. Atkinson, Esq., Aigburth, Liverpool, came a plant of *Odontoglossum maculatum anceps*, the spike bearing eight flowers. There were transverse yellow bars at the base of each deep brown sepal, the lip and petals being rich yellow, with conspicuous large spots of brown, confined to the lower half in the petals, a flower of *Cypripedium Hookeri* type was also sent.

Sir Charles Strickland, Bart., Hildenly, Malton, contributed a piece of *Cattleya curina* with three flowers. He had shown the same plant last year, but it had developed well in the interval.

M. Lucien Linden sent from Brussels a piece of imported *Cattleya Warsowiana* which had opened on the journey from Belgium. *Dendrobium Gallieanum*, which is like *D. thyrsoiflorum*, with a paler and expanding lip, was also sent by Mr. Linden, and from the same was a fine pure white form of *Odontoglossum crispum* named *virginale*, the spike bearing nine good sized flowers.

A pretty form of *Cattleya Mendellii* called *Venus* was sent by R. J. Measurs, Esq., which, with the exception of a little purple mottling in the centre of the median lobe of the lip and yellow in the throat, is perfectly white, a very pretty form; and from the same source came *Masdevallia O'Brieniana*, a pigmy about 2 or 3 inches high, the flowers embedded in the leaves, each sepal half an inch long, dull yellow, with brown transverse bars; and *Coleogyne tomentosa*, a fine plant having five spikes of salmony-brown flowers, the column being yellow, and the lip yellow with brown veins; and a finely-flowered piece of *Masdevallia ignea* Shuttleworthii, red, with crimson-red veins—a very bright and attractive.

A deeply-coloured form of *Odontoglossum crispum* came from N. N. Sherwood, Esq., Dunedin, Stratham Hill, S.E. the plant having eight flowers; and also a fine piece of *Phalænopsis grandiflora*.

Sir Trevor Lawrence had *Lælia purpurata* Brysiana, a variety in which the petals are richly suffused and veined with purple.

Mr. D. Cullimore, gr. to Malcolm S. Cooke, Esq., Kingston Hill, Surrey, contributed a pale form of *Lælia purpurata*, *Cattleya Mossie* var., and a pale form of *Lycaete Harrisona*. Specimens of *Cattleya Warneri* and *Cymbidium Lowi* came from Mr. Balderson, Henel Hempstead. Mrs. Studd, Bath, sent *Lælia purpurata* var. Mr. J. O'Brien, Harrow-on-the-Hill, showed a little *Disa*, *D. tripartitoides*, the flower of which is very small, and the plant only about 9 inches high; the flower is pale pink, with small rose spots, two sepals spatulate and one hooded with a straight spur; the plant is a native of South Africa.

Odontoglossum excellens var. *Albert Edward* was sent by Messrs. F. Sander & Co.; the parts of the flower are white with a yellow margin, spotted chocolate-brown, the lip very pale in the ground colour.

G. Barnham, Esq., Stoke Newington, sent a well-grown *Dendrobium thyrsoiflorum*, and also a piece of *Cymbidium abnoveiflorum*, a species having small yellowish-green flowers, and not at all decorative.

A little group of hardy *Orchis* were shown by Messrs. Patcher & Meade, U.S.A. Nursery, Hextable, Swanley. There were *O. fragrans*, white; *O. incarnata*, many, with crimson lip; *O. provincialis*, yellow and white; *O. Brancettii*, purple; *O. coriophora*, green, all of them small-growing curiosities; *Fritillaria lanceolata* of very dwarf habit, and with purple-brown and yellow flowers; and *Cypripedium calceolus* completed the exhibit.

Fruit Committee.

Present: Sir C. W. Strickland, Bart., in the chair, and Messrs. J. Lee, R. D. Blackmore, H. Weir, T. F. Rivers, J. Cheal, W. Bates, G. W. Cummins, T. J. Saltmarsh, G. Bunyard, Jas. Smith, P. C. Veitch, G. Wythes, H. Balderson, T. Q. Lane, and J. Hudson.

Some excellent specimens of Broccoli were furnished by Mr. W. C. Leach, gr., Albany Park, Guildford, consisting of Veitch's Model; he showed good Parsley.

From the Society's garden came fine heads of *Ledham*, Latest of All (Veitch), *Gilbert's Victoria*, compact and of middling size, *Ransome's Conqueror*, *Witcomb's Improved*, and others. A few heads of the new green Asparagus were exhibited by Mr. Miller, gr. to Lord Foley, Ruxley Lodge, Esher; also a bush of *Mushrooms*.

Mr. Aslett, gr. to C. Butler, Esq., Warren Wood, Hatfield, had a dish of well-coloured fruits of *Peach Alexander*; and Col. J. F. Turberville, Evesny Priory, Bridgend, furnished a green flesh Melon.

The awards will be given next week.

ROYAL BOTANIC.

May 11.—The first summer show was held last Wednesday, when the weather was all that could be desired. The display of flowers was very effectively arranged, but on close examination one or two very poor lots were noticed. In many instances, plants were what had already been doing duty at the Royal Horticultural Society's show on the previous day, or at the Crystal Palace on the Saturday before.

In the amateurs' classes for ten and for six stove and greenhouse plants in flower, Mr. W. Chapman, gr. to J. Spode, Esq., Rugeley, was an easy 1st, showing very creditable examples, neatly trained, *Aphelexis grandiflora*, *Darwinia tulipifera*, *Tremandra ericifolia*, and several *Ericas*, being the best.

In the large class for nurserymen (twelve), Mr. H. James, Castle Nursery, Norwood, was awarded 1st for plants of fair quality, he was placed 2nd for a collection of six stove and greenhouse plants; a large *Erica Caryophylli* and *Exora Dixiana* being his lot. In the class for six, the leading prize went to Mr. J. T. Mudd, Pewsey Nursery, Wiltshire, who had a very nicely-flowered *Bougainvillea glabra* and *Erica Cavendishii*. Mr. James was again to the fore, however, for six fine foliage plants (nurserymen), having a good example of *Chrysophyllum imperiale* and *Cycas revoluta*.

A successful exhibitor was Mr. A. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, who had the best lots of fine foliage plants, *Azaleas* and *Ferns*, from amateurs, showing well as at the Crystal Palace.

Mr. C. Turner, Slough, showed a good number of *Azaleas*, and won 1st for six specimens in the nurserymen's class, having capital examples of *Comtesse de Flandres* and *Duc de Nassau*, and was again leading for a collection of twelve in 12-inch pots, having small pyramid-trained plants in good condition. Mr. C. Turner also showed an excellent lot of *Pelargoniums*, and was again placed 1st for six plants, any section; but 2nd for six fancies, where Mr. D. Phillips, Langley Broom, Slough, was leading, as also for a group of six from amateurs, *Kingston Beautifolia*, *Delicatum*, and *Mrs. Potter*, being capital flowered varieties; while Mr. Turner's best were *East Lynne*, *Prince of Prussia*, and *Ellen Black*. Collections of herbaceous plants and alpine were sent by Messrs. Paul & Son, Old Nurseries, Chesham, who were awarded 1st in both classes; among the plants included were *Trillium grandiflorum*, *Saxifraga muscoides purpurea*, *Arnebia eichoides*, *Cypripedium calceolus*, *Primula japonica*, &c.

Orchids were not largely shown, and the prizes were awarded without any competition. Mr. Whillans,

gr. to the Duke of Marlborough. Blenheim. Woodstock, had 1st for a collection of twelve plants, showing finely-grown specimens of large size; a piece of *Olethoglossum Spectrum* had five spikes of bloom, and each flower measured over 4 inches across; *Dendrobium thyrsiflorum*, *Lælia purpurata*, *Cypripedium selligerum*, and *C. candidum*, also deserve mention.

Mr. Howard, gr. to H. Little, Esq., Twickenham, was awarded 1st for a collection (no number specified), *Lycastris Skinneri*, *Cymbidium Lowii*, *Cattleya citrina*, and *Cypripedium candidum*, being among the best.

Roses were fairly numerous, and of average quality. Mr. W. Ramsey had the best collection of twenty plants, and Messrs. W. Paul & Son led for nine (distinct) both having evenly flowered specimens of popular varieties.

Non-competing collections were numerous among them being an extensive and effectively arranged group of choice Orchids, including *Cattleyas*, *Olo-*

japonicum laciniatum, with the first divisions of the bright green leaf pinnatifid, and *Neprolepis cordata compacta*, having fronds 1 foot long—very compact; also *Cytisus scoparius Andreanus*, *Abies excelsa mutabilis*, and *Juniperus canadensis aurea* (for all of which see the Royal Horticultural Society's report).

Messrs. J. Laing had a good group of *Calceolias*, *Begonias*, and foliage plants, with a few Orchids, in which the following were conspicuous:—*Begonia Mammoth*, double, large bright red; *B. Princess Victoria*, single, white, with crimson undulate aurea; *B. Rosy Moon*, double, large rosy-carmine—loose flower; *B. Duchess of Portland*, double, moderate size, solid flower, deep red and white centre; and *B. Profusion*, single, large, and old gold or apricot colour; also *Caladium Gaspard Craver*, the leaf having a rosy-red centre and veins, with a very dark green edging and *C. Mrs. H. Veitch*, whitish-pink ground, with rose veins. A Small Silver-gilt Medal was given.

and a good example of *Medinilla magnifica* came from Mr. Kelf, gr. to T. J. Waller, Esq., Regent's Park.

The list of certificates will be given next week.

CRYSTAL PALACE.

May 10.—The show held last Saturday was decidedly poorer and smaller than has been the case for some years at the Crystal Palace, and not for want of liberal prizes. The exhibits in the amateurs' section were of finer quality than those in the open classes, and, indeed, some of the plants were very creditable examples.

For six stove and greenhouse plants (amateurs). Mr. W. Chapman, gr. to J. Spole, Esq., Rugeley, Staffs, was a capital 1st; and he also had nine good specimens in the open class, when he again led. Among the best plants were *Darwinia tulipifera*,

FIG. 100. *OLEFARIA GONSIANA*. FLOWERS WHITE. (SEE P. 612.)

toglossum, and *Oncidium*, *Clivia*, and foliage plants, for which a Silver-gilt Medal was given. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, contributed a group of Tree Peonies and cut herbaceous plants, including *Trollius caucasicus aurantiacus*, a bright orange form (Silver Medal). Messrs. Paul & Son, Chesham, sent a group of cut flowering shrubs and ornamental Maples, including those plants referred to in the Royal Horticultural Society's report (Bronze Medal). Mr. J. Walker, Thame, received a Large Bronze Medal, for a number of cut *Maréchal Niel* Roses, a similar award being made to Mr. Turner, for a group of well-grown *Lilium Harrisii*, who also had *Azalea J. T. D. Lowely*, a double flower, rosy-pink, fading off to white at the edges of the petals. From Messrs. J. Veitch & Sons, Chelsea, came a collection of interesting plants, for which a Silver Medal was given; among the constituents of the group were *Ledum*, *Daphne encaurum*, hardy *Azaleas*, *Phyllocactus Brilliant*, scarlet-red; *P. Exquisite*, soft rose; *Rhododendron The Queen*, a greenhouse hybrid, with delicate cream-yellow flowers; *Gloxinia* Mr. J. Donaldson, very bright and intense red. *Acer*

Messrs. W. Paul & Son, Waltham Cross, had a Large Silver Medal for an extensive group of pot and cut Roses, including *Souvenir de S. A. Prince*, *Claire Jaquier*, *Catherine Sempet*, &c.

Messrs. Barr & Son, King Street, Covent Garden, were awarded a Bronze Medal for a collection of cut flowers of *Dianthis*, *Tulips*, and *Anemones*, including *Tulipa elegans alba*, creamy-white, with a crimson protuberant edge; a similar award going to Messrs. Kelway & Son for a collection of continental Peonies and other flowers, including *Syringa alba grandiflora*, a pure white lilac, with large flowers.

Messrs. J. & J. Hayes, Lower Edmonton, sent a group of show *Chelidoniums*, the variety *Empress of India* being very fine. It is rich scarlet, with a white edge, spot very large and crimson.

Mr. G. T. White, Winchmore Hill, had a small collection of Orchids, chiefly varieties of *Cattleya Mendelii*, one variety of which named *albans* was very attractive. It is a pure white, with a yellow throat, and the just faintest trace of crimson on the lip. Silver Medal.

Mr. Knight, Farnborough, had his yellow spathed *Calla* (see Royal Horticultural Society's Report):

Tremandra ericifolia, *Aphelaxis grandiflora*, and *Ericas*.

Mr. J. Ford, gr. to Sir C. Pigott, Bart., Wexham Park, Slough, was a good 1st for six fine foliage plants (amateurs), with vigorous specimens of *Dieffenbachia gigantea*, *Latania borbonica*, and *Alcornoque metallica*. This exhibitor was also very strong with *Calceolarias* in both the amateur and open classes, having very finely flowered and healthy plants. A large and successful exhibitor was Mr. J. Oliver, gr. to C. Warren, Esq., Handcross Park, Crawley, who came in 2nd for stove and greenhouse and for fine foliage plants in the amateur's classes, and was leading for nine fine foliage plants in the open class, having *Cycas rotunda* and *C. circinalis* in fine condition in this section. He also had the best *Crotons* (including a grand *C. angustifolius*), and the best nine-stove and greenhouse Ferns, *Cyathea Smithii* and *Cibotium Schiedeii* being noticeable examples. In the amateurs' class he received 1st for *Dracaenas*, and also for six greenhouse *Azaleas* showing profusely flowered pyramids, one of the best features of the show, *Model*, *Baronne Vriese*, *Mrs. Turner* and *Duc de Nassau* may be named.

Mr. C. Turner, Royal Nursery, Slough, was leading for Azaleas in the open class, having snailish examples, *Grandis*, *Charmer*, and *Mrs. Turner* being the best varieties. Mr. Turner also had a grand specimen of *Azalea Duc de Nassau*, which was judged to be the best specimen greenhouse plant, while the best specimen stove plant was *Ixora Dixiana*, from Mr. W. Chapman.

Mr. J. K. Bird, Dulwich, had some well-grown *Dracaenas*, and Mr. W. Clark, gr. to W. Sopper, Esq., Herne Hill, showed well-flowered *Gloxinias*; also a box of cut flowers of stove plants, winning 1st for both. Mr. Prewett, Hammernsmith, also received 1st for a collection of cut flowers of stove plants.

Orchids were shown only by Mr. J. Douglas, Great Gearys, Hford, who was awarded 1st in the amateur's class, and 2nd in the open. A specimen of *Cypripedium caudatum* had sepals 2½ inches long.

Bouquets and made up floral arrangements were numerous, and of decidedly good quality. Messrs. Perkins & Son, Coventry, and Mr. G. Newman, Bromley, were awarded prizes in the order named in the two leading classes, and each had tasteful and elegant exhibits.

Polargiums were a good feature, and Mr. C. Turner and Mr. D. Phillips, Langley Broom, Slough, were in close competition. Mr. Turner led for a collection of eighteen show and decorative varieties, and he also had the best lot of fancies, and Mr. Phillips was 2nd in both instances. In the class for nine show and decorative varieties, the order of merit was reversed. Mr. Turner's best specimens were seen in *Marguerite*, *Triumph de St. Maude*, *Spotted Beauty*, *Josetta*, *Delectatum*, *East Lynne*, *The Shah*, and *Empress of Russia*; while Mr. Phillips' best were *Kingston Beauty*, *Prince Leopold*, *Lady Isabel*, *Gloriana*, *Miss Inez*, and *Duchess of Edinburgh*.

A collection of grand specimen *Caladiums* was shown by Messrs. J. Laing & Sons, Forest Hill, to which they were deservedly placed 1st. *L'Autonne*, *Candidum*, *Mithridate*, *Clio*, and *Souvenir de Mme. Bervart* were very fine plants.

Roses were fairly good. Mr. W. Rumsey, Joyning's Nursery, Cheshunt, N., was placed 1st in a close competition, having a well-flowered collection, *Thomas Mills*, *Centiolla Rosa*, and *Magna Charta*, were very well represented; Messrs. Paul & Son, Cheshunt, and Mr. C. Turner, Slough, were respectively 2nd and 3rd.

Among the miscellaneous collections were a group of several varieties of *Narcissi*, &c., from Messrs. Barr & Son; a collection of hardy herbaceous plants from Mr. T. S. Ware, Hale Farm Nurseries, Tottenham; Messrs. W. Paul & Son, Waltham Cross, N., had an extensive group of well-flowered *Roses*, and which included the recent novelty, *Corinna*; and a box of good specimens of *Manchael Niel* came from Mr. J. Prewett, Hammernsmith; Messrs. Rider & Son, Manchester, contributed a few varieties of *Primula Sieboldii*; a collection of *Calceolarias*, finely flowered and vigorous, came from Messrs. Sutton & Sons, Reading; a group of *Anthurium Scherzerianum* and *Sarracenia*s were staged by Messrs. J. Peed & Sons, Roupell Park, S.E.; Messrs. Paul & Son, Cheshunt, had a collection of herbaceous plants, and also a flowering branch of *Genista Andreana*, with flowers of yellow and brown. Messrs. J. Carter & Co., High Holborn, London, had a pale yellow *Wallflower*, under the name of *Miss Primrose Carter*—a distinct if not very showy variety; Messrs. J. Laing & Sons sent a collection of *Tuberous Begonias*, in which one named *Mammoth*, very large, bright red, and quite double, was distinct; and from Messrs. Balchin & Sons, Hassoek's Gate, Sussex, came plants of that fine-coloured flower, *Leschenaultia biloba major*.

THE SCOTTISH PRIMULA AND AURICULA.

This Society held its fourth annual show in the City Assembly Rooms, Dundee, on the 8th inst. The show, a very good one, was the best that has yet been held under the auspices of the Society, and the committee may be congratulated for deciding to have the show in Dundee this season. Financially the result was very gratifying, the takings for admission being more than double those of Edinburgh last year. This will enable the energetic secretary, Mr. W. Straton, and his committee, to increase the prize-list in desirable directions, and thereby add to the popularity of those plants, the cultivation of which the Society is so desirous of fostering.

Auriculas generally were very fine, and the

competition keen. The following is briefly the competition in the principal classes:—

Stage Auriculas, six dissimilar.—Eight competitors staged in this class: Mr. W. Kilgour, Blair Drummond, was 1st, with a well-grown lot of plants, consisting of *Mrs. A. Potts*, *Breton's Apollo*, *George Lightbody*, *Lancashire Hero*, *Acme*, and *A. Millar*, self (Kilgour's). Mr. J. D. Ker, Douglasfield, Dundee, was 2nd, with *Acme*, *George Lightbody*, *Black Bess*, *F. D. Horner*, *Col. Taylor*, and *George Rudd*; Mr. J. Black, East Calder, was 3rd, with *George Lightbody*, *Brunette*, *John Simonite*, *Mrs. A. Potts*, *F. D. Horner*, and *Mrs. Dowell*.

Four, dissimilar.—Here Mr. Kilgour again took 1st honours, with *Talisman*, *Acme*, *Blackbird*, and *Geo. Rudd*; Mr. J. D. Ker was 2nd, with *Acme*, *George Lightbody*, *Blackbird*, and *Col. Taylor*; Mr. W. Straton, Broughty Ferry, was a close 3rd, with *Lancashire Hero*, *Acme*, *Blackbird*, and *Alex. Meiklejohn*.

Two, dissimilar, brought Mr. Ker again to the front, with *George Lightbody* and *F. D. Horner*; Mr. Ker 2nd, with *Acme* and *George Lightbody*; Mr. John Menzies, Duns, was 3rd, with *Acme* and *Mrs. Erskine*, self (*Morris*).

For one green-edge, Mr. Menzies outdistanced all with an admirable *Prince of Greens*, that also secured the prizes for the best green-edged flower and the best plant in the show. In every good quality it was, in its class, perfect, and it has rarely been excelled; in the truss, a fully developed one, bore nine pips. Mr. Kilgour took 2nd and 3rd honours, with *F. D. Horner* and with *Lancashire Hero* respectively.

One grey-edge.—Here Mr. J. D. Ker had the competition and the honours all to himself, taking 1st, 2nd, and 3rd prizes, with *Alex. Meiklejohn*, *G. Rudd*, and *G. Lightbody* in their order.

One white-edge.—1st and 2nd prizes went to Mr. Kilgour, with *John Simonite* and *Regular* (*Ashton*), in their order. Mr. Ker was 3rd, with *John Simonite*.

One self.—1st, Mr. Galloway, *Gagie*, *Forfarshire*, with *Paronella* (*Headley's*); 2nd, Mr. J. Menzies, with *Black Bess*; 3rd, Mr. Kilgour, with *Heronie*.

The premier white *Acme* was set up by Mr. Kilgour; the premier grey, *George Lightbody*, by Mr. Kilgour; and the premier self, *Mrs. A. Potts*, by Mr. Kilgour.

A special prize and certificate were awarded to Mr. Kilgour for a seedling blue self named *Vidette*; four competitors entered this contest.

In the alpine classes, Messrs. Kilgour, Menzies, W. Storrle, Lenzie, and Black, were prize-taking competitors. In the classes for *Polyanthus*, Messrs. Menzies, W. Straton and O. Straton, Broughty Ferry, were the prize-takers.

Exhibits from nurserymen and private gardeners added much to the interest of the show. Messrs. Laird & Sinclair, Dundee, had a fine miscellaneous group of plants staged on the floor, consisting of *Hydrangeas*, *Lilium Harrisii*, *Glaucodius The Bride*, choice and beautifully coloured *Conifers*, &c.

Messrs. Peter Barr & Son, London, exhibited a numerous collection of *Narcissi*.

Messrs. D. & W. Croll set up a fine group of stove and greenhouse plants, and Messrs. Storrle & Storrle exhibited an attractive group of stove and greenhouse plants, among which were some well-bloomed *Erica Cavendishiana*, *Boronia elatior*, and *B. Drummondii*, along with hardy spring flowers and florists' flowers. H. S.

GHEENT.

The 14th exhibition of the Royal Agricultural and Botanical Society was held on May 11. The large hall of the Casino was literally packed with interesting and varied collections, of which we can only note a few.

Orchids.—A collection of forty specimens of great merit came from M. J. Hye Leyden, to whom an "objet d'art" was awarded by acclamation. Amongst the plants were *Miltonia vexillaria* var. *Hyeanum*, good in size and colouring; *Odontoglossum Pescatorei Hyeanum*, a superb variety with deep purple spots on the inner side of the petals, and which seen by transmitted light have a fine effect; *Odontoglossum crispum*, with a well-marked lip; a very fine variety of *O. guttatum*; *Cattleya Lawrenceana*; *O. Mendelii*, of extraordinary dimensions; *Cypripedium Schodereri*, with deep red spots; *Oncidium monachicum*, *Masdevallia Veitchii*, *Odontoglossum Andersoni*, and *O. citrosmum*, with four fine spikes.

In the interesting collection of M. Van Inseeboot were *Epidendrum Stanfordianum Wallisii*, *Dendro-*

hium Jamesianum, *Phalaenopsis Luddemanniana*, *Cattleya Mossiae*, *Cypripedium caudatum*, *Odontoglossum Reichenheimii*, and a superb *Laelia elegans*.

MM. Vermeut & Co. showed a good group, including good forms of *Odontoglossum hastilabium luteopurpureum*, *O. Ruckerianum*, *Cattleya Mendelii*, *Oncidium phymatocolum*, and an *Odontoglossum crispum*, with pure white flowers.

New Plants.—M. Auguste van Geert showed fine examples of *Boronia heterophylla*, *Nepenthes picturata*, *Cupraria elegantissima*, *Begonia Arthur Malet*. M. El. Pynaert Van Geert had *Nidularium amazonicum* var. *rubro-striatum*, *Curmeria Leopoldi*, *Caraguata Paecekoffii* fl. *rubris*, *Canistrum Leopoldinum*, and *Pandanus Glazioviannus*. A fine *Anthurium*, called *Flambeau*, came from M. Louis de Smet; a seedling *Anthurium*, from M. Dallière, like *Rothschildianum*, but superior to it; *Cytisus scoparius Andreanus*, from MM. Dubois; and white-flowered *Azalea mollis* from M. Louis de Smet.

Stove Plants.—M. Dallière sent a fine collection of foliage plants. M. Louis de Smet exhibited twenty forms of *Anthurium Scherzerianum*, of large size, with bold foliage, large spathe, brilliantly coloured; amongst them were the varieties *Wardianum*, *sanguinum*, *giganteum*, *grandiflorum*, and *Madame Arthur de Smet*. For this group, which formed one of the features of the exhibition, a Gold Medal was awarded. A fine *Canistrum Salliceri* came from M. Moens, and an unvariegated specimen of *Anthurium Hookeri* from the Countess Kerchove, of Benterghem.

Palms, Cycads, Ferns.—An admirable lot of twenty-five large Palms came from MM. De Smet Frères, containing *Glaziova insignis*, *Cocos Weddelliana*, *Jubaea spectabilis*, *Kentia australis*, an exceptionally fine *K. Canterburyana*, and the rare *Pritchardia Martiana*. In the group shown by M. de Ghellinck de Walle were *Kentia Belmoreana*, *Brabea dulcis*, *Arca Baurii*, and *Thrinax Chucou*. M. Auguste Van Geert had *Washingtonia robusta*, *Arca sapida*, and *A. Baurii*, *Kentia MacArthurii*, and *K. Wendlandii*. Countess Kerchove showed a fine specimen of *Kentia Fosteriana*, M. Spaë Vandermulen a *Latania robusta*, M. B. Spaë an *Arca Baurii*, M. Pynaert a *Chamerops*, and M. Van Geert a remarkable specimen of *Bismarckia nobilis*. These were all fine specimens of choice Palms. A number of fine Cycads came from M. Ghellinck de Walle, including a unique specimen of *Zamia Katzeri*, a fine *Lepidozamia Peroffskiana*, and *L. MacLayii*. In *Mentha*, *Mentha* may be made of the Tree Ferns of MM. de Smet Frères, especially their *Cathea dealbata*.

Miscellaneous Plants.—Here may be mentioned a fine series shown by M. de Smet-Duvivier, well selected and well cultivated. Among them were *Phlœsia luxifolia*, *Asparagus comorensis*, *Hebeclinium atrobunus*, and *Medinilla magnifica*.

Plants in Flower.—M. Kossel, Secretary of the Society, sent fine *Cleome*s, M. Boelens fifty fine *Amaryllis*, the Countess Kerchove and M. Ghellinck de Walle remarkable groups of *Azaleas*. M. Pynaert showed a collection of the hybrids between *Azalea mollis* and *A. sinensis*, with bright lustrous colours. MM. Humann, Pynaert, and De Smet Frères contributed *Rhododendrons*.

Among the Jury, which was presided over by Count Oswald de Kerchove, were Messrs. Protheroe and Shuttlesworth. Ch. D. B.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending May 10, is furnished from the Meteorological Office:—

"The weather has been in an unsettled, changeable condition, with cloudy skies and frequent, and in some cases heavy, falls of rain. Thunder and lightning have occurred from time to time in various parts of the kingdom. In the Hebrides and Shetlands the weather was generally fine and bright.

"The temperature has been above the mean in Scotland and Ireland, as well in England, N.W., and England, S., but in the other English districts it has not differed materially from the normal. The highest of the maxima, which were registered during the earlier days of the period, ranged from 65° in Ireland, S., and England, N.W., to 71° in England, E., and 72° in the Midland Counties. The lowest of the minima were recorded either on the

6th or 7th, and varied from 31° in 'Scotland, E.' to 39° in 'Scotland, W.' In the 'Channel Islands,' the thermometer did not fall below 45°.

"The rainfall has been somewhat less than the mean in the north and east of Scotland, and the north of Ireland, and about equal to it in 'England, N.W.," in all other parts of the kingdom a rather decided excess is shown, especially in the east of England, where the total fall for the week was about three times the average.

"Bright sunshine has been slightly more prevalent than it was last week in 'Scotland, N.," but in all other districts there has been a very considerable decrease. The percentage of the possible amount of duration ranged from 17 in 'England, N.E.," and 22 in 'Scotland, E.," and the 'Midland Counties,' to 35 in 'Scotland, W.," 46 in 'Scotland, N.," and 47 in the 'Channel Islands.'

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE, RAINFALL, BRIGHT SUN. Sub-headers include ACCUMULATED, Above 42°, Below 42°, etc. Rows list districts like North Devon, Devon, Cornwall, etc., with corresponding data.

The districts indicated by number in the first column are the following:— Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Growing Area, Districts—7, Scotland, W.; 8, England, S.W.; 9, England, S.W.; 10, Ireland, S.; 11, Ireland, S.; 12, Channel Islands.

MARKETS.

COVENT GARDEN, May 15. Large supplies of indoor fruit to hand. Prices lower, Grapes especially meeting with a very dull trade. Business generally steady. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES. Table listing plants like Arafia Sieboldi, Arum Lilies, Aspidistra, etc., with prices per dozen.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers like Anthonis, Azaleas, Bluebells, Bouvardias, etc., with prices per dozen.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruits like Apples, Apricots, Grapes, Lemons, etc., with prices per bushel or per cwt.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetables like Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, etc., with prices per bunch or per lb.

Potatoes. A parcel of New Potatoes, both from Malta and the Canary Islands, has been very light during the last eight days, consequently prices advance 4s. to 6s. per cwt. Some 500 tons are now being landed, which will reduce prices again. Jersey potatoes made a good start on Thursday, over 2000 being offered, selling at 1s. 6d. from 10s. to 12s. per cwt. Old potatoes, which have been considerably reduced since last report, prices firm. J. B. Thomas.

SEEDS.

LONDON: May 14.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market as for seeds at this season, inactive. The growing demand for swards is now very nearly over, whilst of speculative purchasing scarcely any yet shows itself. In Trefoil, owing to continued bad crop reports, the late advance is well maintained. Clover seeds, all round are without quotable alteration. There is likewise this week no change in bird seeds. Fine blue Peas, by reason of their scarcity, are getting dearer. Mustard and Rape seed firm.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 10:—Wheat, 31s. 7d.; Barley, 28s. 3d.; Oats, 19s. 2d. For the corresponding period last year:—Wheat, 29s. 10d.; Barley, 25s. 11d.; Oats, 18s. 8d.

FRUIT AND VEGETABLES.

SPITALFIELDS: May 11.—Good supplies of green stuffs, Potatoes, &c. Scarce supply of fruit. Demand good for fruit, but only moderate for vegetables. Prices were as under:—American Apples, 20s. to 25s. per barrel; forced Rhubarb, 10s. to 15s. 3d. per dozen bundles; natural do., 1s. 6d. to 2s. 6d.; Asparagus, 1s. 3d. to 2s. 6d. per bundle of 100 heads; Beans, 1s. to 1s. 3d. per punnet; Cabbages, 1s. 6d. to 2s. per tally; Radishes, 3s. 6d. to 5s. do.; Cauliflowers, 3s. to 7s. 6d. do.; Spinach, 1s. to 1s. 6d. per bushel; greens, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 1s. 6d. to 3s. do.; Spring Onions, 1s. 6d. to 3s. do.; Parsley, 1s. 6d. to 2s. do.; Mint, 2s. to 3s. do.; Horseradish, 1s. 2d. to 1s. 4d. per bundle; Beetroot, 4d. to 8d. per dozen; frame Cucumbers, 1s. 6d. to 2s. 6d. do.; natural do., 1s. 6d. do.; Endive, 1s. 3d. to 1s. 6d. do.; Cabbage Lettuce, 1s. 3d. to 1s. 6d. do.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Egyptian Onions, 8s. to 10s. 6d. per cwt.

STAFFORD: May 14.—The supply has been good during the past week, and a fair trade done at the undermentioned prices: Cabbages, 1s. 6d. to 4s. per tally; Greens, 1s. 6d. to 2s. 6d. per sieve; ditto, 2s. 6d. to 4s. per dozen bunches; Cauliflowers, 1s. to 2s. 6d. per dozen. Carrots (household), 25s. to 40s.

per too; do. (cattle feeding), 12s. to 24s. do.; Maogels, 12s. to 17s. do.; Swedes, 15s. to 18s. do.; Onions, English, 2s. to 3s. per bushel; do. Egyptian, 8s. to 9s. 6d. per bag; Watercress, 6d. to 8d. per dozen; Rhubarb, 2s. to 3s. 6d. per dozen bundles; Radishes, 4s. 6d. to 5s. per tally; Lettuce, 7d. to 1s. 3d. per score; do. French, 9d. to 1s. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: May 13.—Quotations: Regents, 40s. to 60s.; Hebrons, 30s. to 80s.; Magnums, black, 37s. 6d. to 42s. 6d.; Lincoln, 50s. to 55s.; Kent and Essex, 30s. to 60s.; Scotch, 60s. to 100s.; Imperators, 35s. to 70s.; New: Malta and Canary Islands, £10 to £12 per ton.

SPITALFIELDS: May 14.—Quotations:—Magnums, 30s. to 70s.; Regents, 45s. to 70s.; Champions, 45s. to 50s.; Imperators, 40s. to 75s.; Hebrons, 30s. to 50s. per ton.

NOTICES TO CORRESPONDENTS.

"Many communications are unavoidably held over till next week, on account of the pressure on our space.

CATTLEYA MENDELI. J. E. Liverpool. Your No. 1 Cattleya Mendeli is an exceptionally fine variety, the labellum very ample and finely colored. The other two are distinct forms of average merit. The flowers were bruised, but fresh enough for the purpose.

CUCUMBERS, TOMATOS: D. K. The roots are filled with nests of nematoid worms, often figured in the Gardeners' Chronicle, invisible to the naked eye. You must clear out the soil, and everything likely to harbour the creature, charring it all, to make sure that none escape; and then a new start may be made with soil and manure from new sources, and plants also.

ECHORDIA, &c.: Thos. D. Thanks for specimens. As you say, the Echiochorda grandiflora makes a fine bush or tree away from a wall. The Chianthus panicus is good, and the variety of Laurustinus the best we have seen.

FORCING PEACHES.—The Forcing Gardener, by Samuel Wood (Crosby Lockwood & Co., Stationers' Hall Court, E.C.C.).

GROUNDS ON VINE LEAVES: G. L. S. A natural exudation of water. No remedy is required.

HARTFIELD: D. B. H. The present gardener is Mr. Norman. It has been there many years.

HELLIGRUBBER'S NIEHR ROOTS DISEASED: N. B. The roots were rotten, and full of the septate hyphide of some higher Eumycete—Ascomycete, probably, but no fructifications have formed as yet. The soil was full of a large yeast, and this grows in glucose solution. The parasite is certainly not petronospora, but what it is cannot be determined without the spores, &c. It may be a Hypomyces. I should say the Hillebreds were in soil too wet and sour for the plants. H. Marshall Ward.

INSECTS: Killarman. The object sent is the chrysalis of the small common white Cabbage butterfly, which has been destroyed by a number of minute parasitic Ichneumonids, which have made their escape from inside its body, and have spun themselves up in small yellow oval cocoons. The parasites are the gardeners' friends. A. O. W.

LEPIDUM PALUSTRE: J. C. Quite hardy at Wimbledon. It requires a rather moist peaty soil, well drained, and somewhat sandy. The soil should be at least 1 foot in depth. Pretty, either in a bed by itself, or in groups, with Menziesias, Ericas, around Rhododendron beds.

LONDON PURPLE: B. This may now be obtained from Messrs. Hemingway, and may be applied to Apple trees after the fall of the blossom, not when the flower is open. The Michigan experiments show that if the substance is used not stronger than in the proportion of 1 lb. to 200 gallons of water, there is no danger of pasturing under fruit trees. The liquid should be kept constantly stirred, and be thoroughly applied by a force-pump.

NAMES OF PLANTS: Jas. Carter & Co. Edwardsia grandiflora.—R. H. P. Odontoglossum Escatorei.—H. F. I. Bifrenaria Harrisonii; 2, Acries

* Bedding plants in variety in boxes, and also in pots.

Fieldingii; 3, *Oncidium sphaelatum*.—*Botanist*, *Elaeocarpus dentatus*.—*Peristrophe angustifolia variegata*.—*J. C. T. Ornithogalum nutans*.—*N. S. C. Cercis siliquastrum* (Judas tree).—*Dr. Norton*, *Scilla campanulata*.—*G. Hanford*, *A good variety of Vanda Dennisoniana*.—*H. E. B. I. Oncidium Batemanianum*; 2, *Dendrobium amonum*.—*G. Pressly*, *Scilla nutans*.—*H. R. L.* A truly magnificent form of *Odontoglossum maculatum*, the rich golden yellow brighter than any we have seen. Thanks for the photo.—*J. K. A. rades crispum*. *R. L. Lycopodium Hookerii*.—*C. S. C. Ribes anreum*; common in shrubberies.—*Captain 1*, *Alyssum saxatile*; 2, *Pyrethrum Tchihatcovi*; 3, *Sedum dasyphyllum*; 4, *S. album*; 5, *Saxifraga Wallacei*; 6, *S. muscoides purpurea*; 7, *Sedum glaucum*.—*S. B. W.* *Pyrus malva microcarpa*.

RHODODENDRONS: *A. Evans*. The species and varieties sent were beautifully flowered, especially *R. Dennisoniana*, *R. Princess Royal*, *R. Sesteriana*, and *R. Edgworthii*.

ROSE: *A. The* copper-coloured Austrian Briar. There are several varieties, in primrose, orange, &c., but this is the best.

STRAWBERRY: *E. H.* The fruit arrived in a smashed-up state. Want of colour and a slacking of growth are due usually to attacks of mildew.

TOMATO LEAVES DISEASED: *C. G. W.* The leaves are attacked by one of the species of fungi named *Cladosporium*, so often referred to in our pages. You will see hints as to its treatment in our back numbers.

TOMATOS: *Panacea*. The leaves appeared to be punctured by aphid. If the symptoms become aggravated, send other leaves and shoots to us.

TUBEROSE: *N. J. Z.* The spots have no fungi in them so as can be discovered. There must be something wrong with the culture. *H. M. H.*

TULIPS FORCING: *P. E.* Tulips which naturally flower early—and most of these are single-flowered varieties—if potted as soon as they can be obtained, say in August and September, and kept underneath a quantity of finely-sifted coal-ash until the roots have permeated all parts of the soil in the pots, may be put in the forcing-house in December and onwards, care being taken to remove all of them from the ashes as soon as it is seen that top-growth has risen to a height of 2 inches, or thereabouts. Hard forcing is not productive of fine flowers, but flowers are flowers at Christmas time, and large size is not looked for. The flowers are finer with slower methods. The same bulbs are no good for forcing another year, and may be ripened off in a cold pit, or a greenhouse, after flowering, and the bulbs planted in the open border in September and October.

VINES: *H. H.* Fine strong foliage injured by sunburning. It is a case either of bad glass or insufficient ventilation. There is no trace of disease on the leaves sent.

"The Demon" Insecticide and Cleanser

HIGHLY CONCENTRATED—MIXES INSTANTLY WITH WATER. For use in the Conservatory, Greenhouse and Vinery; Flower and Kitchen Garden, the Hop-yard, and the Orchard.

Practically Tested by Practical Gardeners. Acknowledged to be the most Perfect Insecticide yet Invented. From Mr. R. TURVEY, Head Gardener to Sir Richard Webster, Q.C., M.P., Waterford Gardens, Cranleigh, Surrey.—"Yours is the best Insecticide that has come under my notice; it not only destroys the 'pests,' but imparts a healthy look to the plants." From Mr. F. VIGNY, The Gardens, Government House, R.M. College, Yorktown, Surrey.—"I am pleased to say I found our Insecticide all I could desire after a good trial; safe for the most tender-folaged plants. I can confidently recommend it to anyone." From Mr. G. WILKES, Nurseryman and Florist, Trumpington Road, Cambridge.—"We have given Demon Insecticide a fair trial, and I believe it to be the best preparation for the destruction of insects, &c., infesting plant life. We shall continue to use it, and recommend it to our friends."

Testimonials.

"Shilburn Castle, January 5, 1890.
"SIR,—As you requested my opinion of the houses which you erected for me some 1 year ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours. Yours truly (signed) MAURICE STELL."

"Hornby Castle, Lancaster, February, 1890.
"Major FOSTER has much pleasure in stating that the various and foreign houses which were erected by Mr. Helliwell in 1874, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.
"SIR HENRY BENTLEY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

HELLIWELL, 9, Victoria Street, Westminster.

RENDEL'S PATENT CONSERVATORIES, PLANT HOUSES, Orchard and Stove Houses, &c., Glazed on the Indestructible System.

SUMMARY OF SPECIAL ADVANTAGES.

- 1. Saving of from 80 to 90 per cent. in maintenance and repairs.
2. No breakage from contraction or expansion from heat or frost.
3. No breakage from vibration caused by heavy winds.
4. Squares of glass can be instantly replaced.
5. The contraction is very strong and durable.
6. Glass can be put on in one-fourth the time of the old plan.
7. No drip from condensation.
8. Putty, cement, &c., are entirely dispensed with.
9. All the Windows are covered by the Glass, so that it is not exposed to the varying influences of the weather.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is **THE "WORCESTER HERALD,"**

ESTABLISHED 1794.

The leading County Paper. Extensive circulation among the rural and middle classes in Worcestershire and adjoining counties. Advertisers would be well to forward for references and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a special medium. Cheap Rates.

Apply for terms.

SPECIAL FREE. Price 2d.

Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writer.

NOTICE TO ADVERTISERS—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when writing to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

To Noblemen and Gentlemen requiring Land Agents, GARDENERS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 217 and 239, High Holborn, W.C.

HOLLOWAY'S PILLS.—Changes of temperature and weather frequently upset persons who are not careful of their health, and particularly in their diet. These corrective, purifying, and gentle aperient Pills are the only remedy for all defective action of the digestive organs. They augment the appetite, strengthen the stomach, correct biliousness, and carry off all that is noxious from the system. Holloway's Pills are composed of rare balsams, united with licorice matter, and on that account are peculiarly well adapted for the young, delicate, and aged. As this powerful medicine has gained fame in the past, so we give it preserve it in the future by its renovating and invigorating qualities, and the impossibility of its doing harm.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions, HIS ROYAL HIGHNESS THE PRINCE OF WALES, THE KING OF THE BELGIANS, THE LATE EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA, And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. "MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of these Machines have been sold since they were first introduced in the year 1856. And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competitions, and in all cases have carried off the Highest Prize that has been given. The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWER, With Improved Steel Chains and Handles.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

ROYAL GARDENS, WINDSOR, January 28, 1890. To Messrs. GREEN & SON, Limited. Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1856; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself. As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them—they are unequalled. During the season I have them daily in use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Aldershot. I shall feel a great pleasure in recommending them to all my friends. I remain, dear sirs, yours very truly, THOMAS JONES.

Wellingborough, February 4, 1890. To Messrs. Green & Son, Leeds. Gentlemen,—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I had them more durable and do their work better than any other machines I have seen. I am, gentlemen, yours truly, DAVID PERCIVAL, (Gardener to W. Blott, Esq.) Cottingham, Hull, February 13, 1890. To Messrs. Green & Son, Limited, Leeds. I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 68-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it for repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose a Price List. I am, gentlemen, yours truly, JOHN BAYNTON, Ivy Bank, Broadway, Worcester, April 13, 1884. Gentlemen,—Some fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, has from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever since. I am, yours faithfully, Messrs. Green & Son, Leeds. C. FRENCH HARTLEY.

Mr. J. R. STIRLING, of the ROYAL GARDENS, BUCKINGHAM PALACE, writing under date Feb. 21, 1890, says:— "As regards the work your 42-inch Horse Machine does (which two years ago took the place of the one you supplied in '63), I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your "Hand Silens Messor" also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers."

Bathelme, Ashford, Kent, June 14, 1878. Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for 50 many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer anyone to me, and I will then show them the S. M. at work, and I shall show it to all I can. I am, yours truly, W. H. MOULD.

Kintbury, Hungerford, April 20, 1883. Sirs,—I shall be glad of a list of your Lawn Mowing Machines' prices. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Mo. day was it put quite out of use by the snapping in two of the driving wheel and the hammer. It is surprising to think of the work it has done, and done well. Yours faithfully, ALFRED T. BAZETT. Messrs. Green, Leeds.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

GREEN'S Patent LAWN TENNIS COURT MARKER.

No. 2412. The Best Marker made. Size with 1 wheel for Ordinary Courts, price 14s. Do., with 3 wheels, 17s. Size for Clubs and Large Grounds, price £1.

GREEN'S PATENT GRASS EDGE CLIPPER

Size and Price, 7 inches wide, 7 lbs. diam., £1 16s. Packing Case, 3s. Specially designed to meet a want which has long been felt in cutting the overhanging grass on the edges of fields, borders, flower-beds, &c., and do away with the tedious operation of cutting with shears. It is a very useful and serviceable Machine.

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland. The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Dealers supplied the same day they are received. The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser. N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places. GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON; or they can also be had of any Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

SACCOLABUM BELLINIANUM, Rehb. DENDROBIUM LEBTELLOM. "BOXALL. MESSRS. PROTHEROE and MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 30, at half past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., a few imported plants of the very lovely SACCOLABUM BELLINIANUM, extremely rare in cultivation; the species it will hardly be met with, Williams' Orchid Album, and the plants now offered are superior to any we have hitherto received. Also a grand lot of imported plants of the Primrose-coloured DENDROBIUM LEBTELLOM, the best ever imported. D. BOXALL, D. WARDIANUM, and other choice species.

The Sale will also include a large quantity of ORCHIDS in Flower, from various collections, together with a fine plant of ODONTOGLOSSUM PLUMBIUM, &c.

Special Sale, Tuesday, June 3.

ORCHIDS IN FLOWER. MESSRS. PROTHEROE and MORRIS respectfully announce that their NEXT SPECIAL SALE OF ORCHIDS IN FLOWER will take place as above, for which they will be glad to RECEIVE NOTICE OF ENTRIES AS EARLY AS POSSIBLE.

Friday, June 6.

Important to Orchid Growers and Others. THE unique and singularly beautiful COLLECTION of Life-size WATER-COLOURED DRAWINGS OF ORCHIDS, by Durham, comprising 286 Drawings in 22 handsomely bound volumes, and formed by the late John Day, Esq., of Tottenham, and published by Messrs. W. & A. Gilbey, of Stamford Hill, is undoubtedly the most valuable Collection of Orchid Drawings extant.

MESSRS. PROTHEROE and MORRIS have been favoured with instructions to SELL the ABOVE VALUABLE COLLECTION by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, June 6, 1890, at 2 o'clock precisely, in one lot.

May be viewed at the Auctioneers' Offices two days prior to the Sale, or at any previous time by appointment. Descriptive Catalogues are now ready, and will be forwarded on application to the Auctioneers, 67 and 68, Cheapside, London, E.C.

Stamford Hill.

40,000 GREENHOUSE and BEDDING PLANTS. MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, on the Premises, the Stamford Hill Nursery, Park Lane, N., adjoining Stamford Hill Station, G. E. R., on SATURDAY, June 7, at 1 o'clock, by order of Mr. W. J. Sampson, 40,000 well-grown GREENHOUSE and BEDDING PLANTS, including 10,000 Geraniums, 3,000 Verbenas, 20,000 Pelargoniums, &c. and a large stock of the best varieties, several valuable specimen Camellias, and other Stock.

May be viewed three days prior to the Sale. Catalogues had of the Promises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Cut Flowers, Plants, and Bulbs.

We hold Sales, several each week. Reference to senders of various standing. Particulars on application. MESSRS. POPE and SONS, Sale Rooms, 6, Philip Street, adjoining Market Hall, Birmingham.

To be Sold by Auction, without reserve.

THE COLLECTION OF ORCHIDS and GREENHOUSE PLANTS of the late George Firth, Esq., J.P., Mammingham Thorpe, Toller Lane, Haddington, Ayrshire, is proposed to be sold precisely to the Sale. No plant or description will be sold previous to the Sale. MESSRS. T. S. BEST and HARRIS respectfully beg to give notice that they have received instructions from the Executors of George Firth, Esq., to SELL by AUCTION, on FRIDAY, JUNE 14, at 11 o'clock, a large and valuable COLLECTION OF ORCHIDS, and several GREENHOUSE PLANTS, amongst which will be found specimen plants of the following:—Rhododendron Veitchii, Duke of Edinburgh, Japonicum, Duchess of Commouth, Countess of Haddington, Annyrills, Empress of India, Mrs. George Firth, George Firth, John Heal, and Mrs. W. Lee. Imantophyllum in great variety.

On THURSDAY and WEDNESDAY, June 10 and 11, 1890, the extremely valuable COLLECTION OF ORCHIDS, which have been bought principally in flower, and which includes the following Plants:—

THE "PERFECT" SUMMER SHADING
 Supersedes all Others WITHOUT WHICH NONE IS GENUINE.
FOR SHADING GLASS ROOFS OF ALL KINDS.
 Is the Cheapest. Goes four times as far as the old preparations. Note its merits described below.

Messrs. CARLTON, Contractors for the painting of the Glasgow Exhibition of 1888, write:—
 "By order of the Directors we applied this Shading to the glass roofing of the Glasgow Exhibition, and found it possessed great advantages over all other preparations we had met with. Being applied cold it was most convenient to use, and while it resisted the action of the rain the whole season it was at once easily removed by gentle rubbing after wetting. It afforded a cool and pleasant shade, at the same time admitting an abundance of light."

PRICE.—1 lb. tin, 1s.; 2 lb. tin, 2s. Post-free, 1/4d. extra. 1 lb. makes half a gallon for use.

THE "PERFECT" WEED KILLER
 Maintains its Superiority over all Rivals for permanently destroying vegetation on Walks, Carriage Drives, Ash Tennis Courts, Stenowork grown green, &c. Used at Kew Gardens, Royal Horticultural Gardens, &c.

SOLD by SEEDSMEN and FLORISTS.

TO MARKET GARDENERS, &c.—To Grow FINE VEGETABLES and FLOWERS. Gardeners should use SULPHATE OF AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary Stable or Farm-yard Manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructious on application, post-free. PRICE: Free on rail, at Sheffield, 13s. per cwt., or 1s. per 50 lb. P.O. Orders payable to the Manager, Sheffield Gas Company, Sheffield.

NATIVE GUANO: BEST and CHEAPEST MANURE for Garden use, NATIVE GUANO. Price 23 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt. 1 cwt. sample, free sent, carriage paid, to any station in England on receipt of P.O. for it.

Extracts from Thirteenth Annual Collection of Reports:—
 NATIVE GUANO for POTATOS, VEGETABLES, FRUIT, &c.—C. F. FIDLER, Reading, used it for Potatos, and says:—"I found your Manure gave very satisfactory results."
 G. F. WALTER, Gr. to Col. the Hon. W. P. Talbot, says:—"I can strongly recommend your Native Guano as a first-rate Manure for any fruits or kitchen garden crops, also grass. In the 5 years during which I have freely used it, I have gained over 500 prizes."
 NATIVE GUANO for ROSES, TOMATOS, &c.—W. G. BAILEY, Nurseries, Bexley, used it for Roses, Tomatos, and Cucumbers, and says:—"I find it a good and cheap article."

A. F. BARRON, Royal Horticultural Society, says:—"Without doubt a very valuable Manure, and easy of application."
 Orders to the NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

For GREENHOUSE or GARDEN.

Price:— 7 lb. 14 lb. 28 lb. 56 lb. 1 cwt.
2s. 3s. 6d. 6s. 12s. 14s.

And in 6d. and 1s. packets.

To be had of Seedsmen and Florists, or the NORMAL MANURE COMPANY, Ltd., 121, Bishopsgate Street Within, E.C., and Farnham Road, Guildford. Food Trade Discounts. Wholesale of Messrs. HURST AND SON, 152, Healdsitch, London.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFETUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 65°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 60°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much sweeter test of efficiency than when applied by hand-brushing or spraying—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. McAlvion & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) H. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons) 10s. 6d. and 20s. 6d.; in quantities of 6 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

Great Reduction in Price of LETHORION (VAPOUR CONE).

Nothing can surpass this method for the total destruction of Insect Pests in Greenhouses. It CANNOT fail where the houses are secure. No possible injury to the most delicate plant.

PRICES For Frames, &c., of 50 cubic feet, 6d.; 100 feet, 9d.; Houses, &c., 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each. Owing to the enormous demand, intending users should give their Seedmen Early Orders to secure a supply.

MANUFACTURERS—

THE "STOTT" FERTILIZER AND INSECTICIDE DISTRIBUTOR COMPANY (LIMITED), BARTON HOUSE, MANCHESTER.

SAVE HALF THE COST. BEDFORDSHIRE COARSE AND FINE GARSIDE'S SILVER SAND

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade.

Customers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost. NO TRAVELLERS OR AGENTS.

Apply direct to the Proprietor for Samples and Price free on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force to all parts. All kinds of PEAT supplied at lowest possible prices. Sample Bag sent on application to GEO. GARSIDE, Jun., F.R.H.S., Leighton Buzzard, Beds.

AT LAST A Boom to Plant Growers. No more Talcum Paper, with its dangerous and disagreeable fumes.

CAMPBELL'S FUMIGATING INSECTICIDE

Kills Fly, Thrip, and Spider, in the easiest, cheapest, and most harmless way to Flowers, Fruit, or Folage, even if treble the necessary quantity is used. The best of all Insecticides for Orchids. Try it. In Rolls for houses of a capacity of—

100 cubic feet, 500 feet, 1000 feet, 2000 feet, post-free. 8d. 1s. 1s. 2s. 3s. CLIBRAN, Oldfield Nursery, Altrincham; 10 and 12, Market Street, Manchester.

MOST EFFECTIVE & SAFEST TOBACCO PAPER
"Improved & only Genuine Medicated"
1 1/4 per lb. Circular, with testimonials, Post Free.
8d. 1s. 2s. 3s. CLIBRAN, Seed Merchants, CHESTER, & Nurserymen.

BEESON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 13s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

GREAT REDUCTION IN PRICE OF STANDEN'S

Established Nearly 30 Years. MANURE

The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices:—28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS:

CORRY, SOPER, FOWLER & CO. (LIMITED), LONDON.

Sold by all Nurserymen, Seedsmen, and Florists.

SHANKS'S IMPROVED LAWN MOWER

THE ORIGINAL LAWN MOWER FITTED WITH DOUBLE-EDGED SOLE PLATE, Enabling the Cutting Parts to last twice as long as in other Machines.

These Machines are strong and substantial, and very easily worked. They make the Lawn like velvet, and are not liable to get out of order. ILLUSTRATED CIRCULARS, with full particulars of Machines (from 25s.), for Hand, Pony, and Horse-power, sent free on application.

NEW LIGHT MACHINE.

WILL MOW VERGES ROUND FLOWER BEDS, &c. VERY EASY TO WORK. Prices and Particulars on application. GARDEN ROLLERS OF ALL SIZES.

ALEX. SHANKS & SON,

Dens Ironworks, Arbroath, And 110, Cannon Street, London, E.C.

A Large Stock of all sizes of Machines always kept in London, where Repairs are also executed by experienced workmen.

LONDON ADDRESS for Repairs:— 5, Old Swan Lane, Upper Thames Street, E.C.

THE Gardeners' Chronicle.

SATURDAY, MAY 24, 1890.

LINTON PARK.

LINTON PARK has been a seat of several successive families of knights and baronets, including the grandfather of Sir Horace Mann, who built the house early in the last century. Sir Horace himself—the great army clothier and friend of Sir Robert Walpole—was buried in the church at the little village in 1786.

In Brayley's *Beauties of England and Wales*, 1807, Linton is spoken of as famous for its Hops, and the adjacent tract of Coxwath is described as an elevated and pleasant spot, where a large part of our army was encamped a hundred years ago, so that the Heath was then a busy place—much visited by the public as Aldershot is now. In these days it is quiet enough, being solely devoted to rural industry.

The rag-stone of Coxwath is excellent for fruit, and as the rags of Kent are riches, it does not pay to leave the land in Heath. It is a delightful walk, or drive, of 4 miles from Maidstone to Linton, across an open country of cornfields, with a wide view bounded by the chalk range north of Maidstone. The Medway, with the famous Hop and fruit-producing parishes of Farleigh and Wateringbury, lies 2 miles on the right, and Yalding—another Hop-producing parish—is a little higher up the stream. From its source to its outfall, Hops are always found on the banks of the Medway. A novelty of the road before reaching Linton is the village of Loos, lying 100 feet below the highway, in the gorge of a small stream which flows into the Medway within a short 3 miles. This deep lying sheltered village has been called the Spa of Kent, and a more picturesque and cosy spot could hardly be desired, if it were not a little too low—too much like an oven in summer, and too much addicted to diphtheria and fever from the want of proper drainage.

Houses should neither lie too high nor too low. The site of Linton Park is perfect in regard

DAHLIAS.—Clearance Sale.—A superb Collection, including all the most beautiful and popular of the Show and Fancy Cactus-flowered and Pompon varieties, 3s. 6d. per dozen, 6 for 2s., or 25 for 6s. 6d. Extra choice sorts, 4s. 6d. per dozen, 6 for 2s. 6d., or 25 for 8s. All strong plants, correctly named, and ready for immediate planting out. Carriage free at prices quoted.

ILLUSTRATED CATALOGUE (No. 21), containing 120 Illustrations and much valuable information on the cultivation of Ferns, ONE SHILLING and SIXPENCE, post-free.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

to health and aspect, both for man and shrub. Entering the carriage drive from the main road, you soon find yourself between the lines of a fine avenue of English Elms, and the house stands at the end of these on lower grounds. But it stands high, nevertheless, commanding a noble view of the lower country. The present owner of the property is Mr. F. S. W. Cornwallis, M.P., and the good people of Maidstone enjoy ample opportunities, on several days in the week, of appreciating the gardens and grounds of their member's residence. The beauty of the stately homes of England, and the kindness of the clever men who rule over the gardening department, have rendered my visits to these cultured scenes exceedingly agreeable, and Mr. McKenzie is so overflowing with knowledge and anecdote that he made my visit to the gardens he presides over a day to be remembered.

The numerous specimen trees in the pleasure grounds shall be named in order as we reached them, and first on the list is a Cork tree—*Quercus suber*—planted by Sir Horace Mann, September 20, 1778. The ground here is very productive, and the aspect and shelter are as good as the ground, the Cork tree accordingly has reached a circumference of 10 feet at several feet from the base, and its height is in due proportion to the size of its trunk. It is a very handsome tree, full of foliage, with a plentiful yield of cork. Near it is a Copper Beech, remarkable for size and symmetry, and for abundance of branches, well clothed with leaves. A beautiful and well-furnished *Araucaria imbricata* near this spot, declared decisively by its appearance that the soil and climate of this part of Mid-Kent are suitable to it. The Wellingtonias assured us of the same fact as we passed them in different parts of the grounds. They are handsome trees under favourable conditions, though very poverty-stricken otherwise, and they grow here with a vigour which speaks for itself. While admiring the Conifers in this part of the grounds, Mr. McKenzie informed me that the shrubbery had been enlarged, and that several men working on the place can remember when the ground now covered with several sorts of large and handsome Conifers, including Cedars of Lebanon, 80 feet high, was cultivated as a Hop garden. No doubt the Hops, well cultivated with plenty of manures, proved a good preparation for shrub and ornamental timber, though it seems probable that the effect of deep cultivation may wear out after the lapse of a few years. Mr. Selby found that trees grew more rapidly for a few years on trenched land than on that which was merely dug 6 inches deep; but after thirty years the difference in size was not perceptible. The Hops must have grown here at the time when Lindon Place, as it is called in the guide book, was occupied by Viscount Holmesdale, M.P., whom I remember as the leader of those Hop-growers who agitated for the repeal of the duty on Hops, which their successors are just now as eager to restore, so as once more to protect their industry against foreign competition.

An exceedingly handsome specimen of the Golden Yew has spread itself over the ground within the limits of the former Hop garden. It forms a clump 40 feet in diameter. The deciduous Cypress, *Taxodium distichum*, is here a little too high up, one would suppose, for a semi-aquatic tree. The banks of the Medway would suit it better. *Abies orientalis*, on the contrary, is quite at home, and the fine specimen growing here bears out the remark in Veitch's *Manual of the Coniferae*, that this is one of the most ornamental of the Firs. It finds here,

in the midst of other shrubs, the sheltered site which it loves, and its pyramidal growth is relieved of formality by the great number of its slender bachellets, by the delicate green colour of its foliage, and by the habit of the lower mass of branches in hugging the ground. A noble specimen of *Libocedrus decurrens* (*Thuja gigantea*), exceeding 60 feet high, has won such admiration from those best able to estimate its merits, and the authors of the work just named introduced an illustration of this particular specimen in their book. The Tulip trees are greatly admired here by that excellent judge of things worth looking at—the British public residing at Maidstone and the neighbouring district, and coming to Linton Park for an outing. Two specimens of *Magnolia conspicua* standing on the lawn on May 10 in full blossom, were beautiful beyond description, and had been so for some time, though the shedding of the petals on the grass gave warning that the gorgeous spectacle would soon be over. One of these neighbouring shrubs had produced this year about 8000 blossoms, whose all-pervading and exquisite fragrance was shed far and wide. The best of the two shrubs covers a space nearly 120 feet in circumference. It is well sheltered from north winds, standing in the pleasure garden south of the house, which is situated under the crest of the high ground on which it stands, and on the south side. The west and east are shut out by timber and shrubbery, and garden walls. I should say, by all means plant *Magnolia conspicua*, but remember the liability of such bold flowers as it bears to be torn by wind in exposed situations. Towering above these handsome shrubs is an English Elm, 120 feet high and 18 feet in circumference at 5 feet above the ground. Such a tree could only grow in land of good depth and fertility. A variegated Lime caught the eye next, so it was entered in my note-book as a particularly picturesque object.

Our walk had now brought us immediately in front of the house—a handsome building, well covered with creepers, with a fine specimen of *Magnolia grandiflora* among them. A standard Bay, planted at a little distance from the wall, and growing nearly as high as the mansion itself, was as full as heart could desire of bloom and beauty, and fragrant foliage—a delight to all passers by. The Banksian Rose is, of course, at home here, and the Pomegranate. Under the terrace of the house several specimens of the Palm, *Chamaerops excelsa*, grow to a height of 18 feet, flourishing here unsheltered at all seasons. *Aralias* and *Myrtles*, too, stand out the battle and the breeze, and, as yet, have taken no harm. The balcony of the house is a point of vantage from which one can see how good the site, and how wide the prospect are.

The whole country of the wild forms its garden. Immediately below the windows is the richly planted pleasure garden, and in the centre a space devoted to bedding plants flanked on either side with banks of tall Cyresses and other shrubs. Beyond the garden and park is the wide world, with villages half hidden by timber and orchards, and through this peaceful scene a train, having just left Paddock Wood, is hurrying away to Dover, leaving the trail of its engine behind it. The high ground of Goudhurst and Craabrook lies due south. Hawkhurst is beyond, but out of sight. Tenterden is on the left, Tunbridge Wel's and Eridge Castle on the right, and scores of other places in this rich district might be named as lying within view of these windows.

We now marched straight for a celebrated group of Japanese Conifers, passing on the way an exceedingly well-furnished specimen of *Cupressus Lawsoniana*, which bids fair to reach the typical 100 feet, which it attains in California, a handsome clump of Cotoneaster, and Acacias bearing Mistletoe. Then we reached the beautiful "group of Japanese Conifers in Linton Park," which forms one of the illustrations in Messrs. Veitch's *Manual*. They consist of the Japanese Cyresses, *Retinosporas*, the *Thuiopsis dolobrata*, and *Cryptomeria*. Other interesting specimens which we met with are a male *Araucaria imbricata* in full catkin; a Cork tree

from an acorn of the one before mentioned; and *Cryptomeria elegans*, looking healthy and happy, and no doubt feeling proud of having been for its beauty, selected for illustration in the *Manual of the Coniferae*. Another, and the last single specimen I can mention, is *Abies concolor*, making its way up fast towards the "80 to 150 feet high," which it reaches in California, or eastwards thence to the Rocky Mountains.

A beautiful avenue of English Elms, forming a walk or alley, runs from this western side of the shrubbery to the north front of the house, where it meets the wider avenue of the approach road. All these Elms are of the same age, and may, perhaps, have been planted about the same time as the Cork tree. Parallel with the charming Elm tree walk, which Mr. McKenzie decorates every year with Crocuses and other early flowers, is an avenue of Wellingtonias, handsome, large, not too close together, and with rich foliage. One of these trees, though healthy in appearance, is only about half the height of the others, and a tall Scotchman, of great eminence in science, asked Mr. McKenzie to explain this. The shrewd reply was, "May I venture to ask how it came to pass that you are several inches taller than I am?" So one Scotchman may "bang" another on the principle of "diamond cut diamond."

In the conservatory there are some fine specimens of the Tree Fern, *Dicksonia antarctica*, standing in a pleasing ground-work of Selaginellas, with a belt of bright flowers on the shelves round the house by way of contrast; Azaleas, Deutzias, Spiraeas, and Arums, and many others, illuminating very pleasantly, with simple and effective artifice, the prevailing green of the central bed. There are six vinerias, and in the Muscat-house is a fine specimen of the Creeping Fern, *Lygodium scandens*, trained to strings, so that a string at a time of this most useful decorative plant may be cut off for twining round the stems of vases and table ornaments. The *Lapageria alba* grows and blossoms here on a wall, with glass above, in the fashion of a verandah open in front.

I must not forget the long ribbons of exquisite blue *Gentiana* in full blossom, and as the Apples from these gardens have won many prizes, a discourse on Apple culture might not be looked for. But I have preached my sermon, and may not start off on a new text just now. *H. E.*

NEW OR NOTEWORTHY PLANTS.

TULIPA CILIATULA, Baker, n. sp.*

This new Tulip inhabits the Anti-Taurus Range in Asia Minor, and has been distributed freely by Mr. Whittall. It belongs to the same group as *Gesneriana*, but has a large black blotch with a yellow border at the base of the segments. It is nearly allied to *T. undulatifolia*, Boiss., figured *Bot. Mag.*, t. 6308, but the perianth-segments are shorter and obtuse. From *T. Julia* and the dwarf forms of *præcox* it differs by its subglabrous bulb scales. My description has been made from specimens flowered at Kew, and others sent by Mr. Barr.

EUCHARIS STEVENSI ×.

Under the name of *Eucharis Stevensi* ×, Mr. W. Stevens, of Walton, Stone, Staffordshire, has for-

* *Tulipa ciliatula*, Baker, n. sp.—Bulbo parvo ovoido; tuniis brunneis rotis glabris vel subglabris; foliis 4 lanceolatis, undulatis glaucescentibus obscure ciliatis; pedunculo glabro; periantho campanulato unciali splendide coccineo segmentis ovatis obtusis obtusis basi connatis nigro-maculatis, lateri ribus angustioribus; staminibus periantho subulpo brevioribus; filamentis nigris; ovario acute trigono, stigmatibus parvis.

Bulb small, ovoid, $\frac{1}{2}$ – $\frac{3}{4}$ inch in diameter; outer tunics brown, nearly or quite glabrous inside. Stem, including the peduncle, not much over half a foot long, glabrous. Leaves four, lanceolate, ascending, acutely, 4 to 5 inches long, glaucous green on both sides, obscurely ciliated in the margin. Peduncle glabrous, 2 inches long. Perianth bright crimson, campanulate, 1 inch long, the segments all obtuse, with a large black blotch bordered with yellow on the claw, the three inner narrower than the outer. Stamens half an inch long; filaments black, twice as long as the black ovary, green, acutely trigonous; stigma small. *J. G. Baker.*

warded to Kew a specimen of a hybrid that was raised by his son from seeds of *E. candida*, fertilised by the pollen of *E. Sanderi*. It is somewhat intermediate between its parents, having the perianth segments broader, and the tube longer and more slender than in *E. candida*, and the corona about half the length of that of *E. candida*, but similar in character, with, however, much more slender and longer filaments. The corona is six-lobed to about half-way down, and in some flowers the lobes have a distinct tooth on each side of the filament, in others the sides of the lobe more or less taper into the filament, or have rounded shoulders instead of distinct teeth. The flower measures from 3 to 3½ inches in diameter, and is pure white, with a yellow tint on the inside of the corona. The petiole is flat on the face, and the

A NEW BAMBOO.

(*BAMBUSA PALMATA*, HORT.)

ONE of the most noble and distinct of all the Bamboos, so far as its foliage is concerned, is one sent to us under the above name by M. Marliac, the well-known specialist of Temple-sur-Lot (Lot-et-Garonne), France. Without flowering material, Bamboos are exceedingly difficult to make out specifically; but so far as leafage goes, the plant resembles *Gaudea* or *Dendrocalamus latifolia*, as illustrated at plate vi. of General Monro's *Monograph of the Bambusoidee*.

So far, B. *Ragamonski* has been our largest-leaved species, but B. *palmata* has much finer leaves, and is more erect in habit. As sent by Mr. Marliac, the stems are 5 feet in height, with from five to seven

that they will not endure drought or dry scathing winds. In moist rich soils and sheltered positions they grow rampant, and add a grace to ordinary shrubs that no other hardy exotics can do.

Again, I should like to ask whence and from whom may seeds of Bamboo be obtained? The seeds germinate so readily, and, as General Munro pointed out in 1866 (*Trans. Linn. Soc. Lond.*), the young plants grow so rapidly that it seems a pity the harder kinds of North China, Japan, the Himalayas, and the Andes cannot be reared in quantity.

Where is *Arundinaria macrosperma* of the Southern States of America now cultivated in Europe? One of the most distinct of all the dwarf kinds is one from Japan growing 2 feet high. Its leaves are about 3 to 5 inches in length by 1½ inch in breadth, and it acquires a variegated aspect from the withering and bleaching of the margins of its leaves. Can anyone tell us the name of this peculiar species? *F. W. Burbidge*. [*Bambusa tassellata*, hort., see p. 578.]

FLORISTS' FLOWERS.

THE TULIP.

The Tulip is a May flower, and a very handsome one, too; although, during the last few years the seasons have been so late, that the managers of the National Tulip Exhibition have been obliged to push that interesting floral display into June. It is good news to the old fanciers to hear that the taste for Tulips has spread in the south, and that many fanciers are inquiring for the old favourite varieties. As in the north, so in the south, a cumbersome frame-work has to be erected over the beds in the form of a span-roof about 10 feet wide. This admits of two beds, with a narrow path in the centre, the bulbs being planted in rows across the beds, seven bulbs in a row. The framework over the beds is used to hold in position a canvas screen, which is run up and held down as required by pulleys and cords. The whole arrangement is very unsightly in a garden, and the Tulip beds are sometimes planted in an out-of-the-way corner, where the protective materials required for the beds in winter and at blooming time is kept out of sight. If Tulip bulbs should ever again be valued so highly as they have been in years gone by, it will be found much cheaper and better in the long run to erect cheap glasshouses over them. Years ago I stated in the pages of the *Gardeners' Chronicle*, how well we managed to protect the Tulip beds with glass lights from frames which are not in use for other purposes in May. The lights are merely placed over a light framework, the sides of which are covered with light shading material, to protect the flowers from high winds or driving rains. This simple arrangement answers very well to protect the blossoms, but is not so elegant or complete as the light glass structure erected by the Rev. F. D. Horner for his Tulips. It is fine enough to cover the usual two beds, with an alley in the centre. The bulbs, seven in a row, are planted across the beds, the path in the centre of the house being wide enough, and the roof sufficiently high, to afford a pleasant promenade. Of course, in the early years of the Tulip, fancy glass was dear, owing to the heavy tax upon it, and cultivators had to do the best they could under the circumstances. It is certain that blooms must be protected, as they cannot stand heavy rains, and hailstones sometimes make sad havoc of the beautiful flowers. *J. D. E.*

THE AURICULA.

Some remarks on the show Auricula were published in these columns, p. 326, giving an account of the state of the plants about the end of the month of February. At that time Auriculas were in a very forward state; and growers were complaining that their flowers would be too early for the exhibitions. Our own were at that time in a more forward state than I have ever known them to be. I recommended, and also put in practice, free ventilation; removing

FIG. 106.—*BAMBUSA PALMATA*.

blade of the leaf similar to that of *E. Sanderi*, being 12–14 inches long, and 5–6 inches broad. It promises to be a good acquisition, since Mr. Stevens informs me that it is "a wonderfully free-flowering plant," in consequence of which he has "discarded *E. amazonica* entirely." In the specimens sent, there were seven flowers to each umbel. It appears that the plants were raised in 1883, and flowered for the first time in September, 1885, and were sent to the Royal Horticultural Society about two years later, but were there taken to be *E. Mastersi*, to which it no doubt bears some resemblance; but, so far as the material at my disposal will permit me to judge, *E. Stevensi* appears to differ from *E. Mastersi* in having the perianth segments longer in proportion to their breadth, and coronal lobes about twice as long, and distinctly narrower. Mr. Stevens remarks of it that mealy-bug will not live upon it, although scale will do so. *N. E. Brown, Herbarium, Kew.*

leaves at their apices only; the largest of these leaves are 12 to 13 inches in length by 4 to 5 inches in breadth at their widest part. The figure (106), shows the stems and the leaves about one-third of their natural size. Above, the leaves are of a rich yellowish-green tint, finely lined or veined, and below they are of a soft blue or glaucous hue. The plant is said to be hardy, but even if it should not be so under all circumstances, the plant is so noble and distinct in habit and leafage that it is well worth pot or tub culture in the greenhouse or conservatory.

It would be very interesting if the growers of Bamboos in continental gardens would tell us something as to the species and varieties they cultivate. Again, how many species are there hardy in Great Britain and Ireland? My own experience with about a dozen kinds is, that they will withstand a good deal of cold weather and actual frost, but

the lights altogether in mild weather. So that "they would be able to withstand the low degree of cold we may yet experience." My prediction was verified, even before the paragraph was published, as we registered early in March a lower degree of cold than I ever knew in that month, the thermometer fell to 9° Fahr., or 23° of frost. A cold period followed this sudden change, and the result was a much later bloom than some people expected, but where the plants were protected from the cold east winds, and the frost kept out by a little artificial heat, the quality of the flowers was quite up to the average. The result of the National Auricula exhibition in the Drill Hall, has also gone to prove that we are doing more than merely marking the time in the raising of seedlings. Mr. Turner, of the Royal Nurseries, Slough, has taken the lead in raising new alpinas; and an excellent amateur cultivator, Mr. Thomas H. Wood, of Reading, has also produced some good seedling alpinas. The Rev. F. D. Horner is a long way ahead of any other cultivator in seedling show Auriculas of high class quality. He has produced green, grey, white, and self-edged flowers superior to anything that has ever been raised.

I am constantly asked "when is the best time to repot Auriculas?" My reply is, now; if the plants were not required to produce seeds, I would repot everything before the end of May, in order that the plants may be well established before the heat of June and July. How repotting is done is an important question. In the first place it may be said that generally growers have given up the use of special composts, not believing them to be necessary. Mr. Horner takes his loam from that part of his garden where the Potatos are growing, and employs no turfy loam. This soil is mixed with decayed manure, and leaf-mould, and charcoal broken up finely is preferred to sand of any kind. It may be said that large pots should not be made use of. I have gradually come to the conclusion that 5-inch pots are sufficiently large for the largest plants, and the main part of our collection is grown in 4-inch and 4½-inch pots; and indeed some of the best ones flowered in 6's. The pots are well drained, and over the drainage some rough turfy stuff is placed to prevent clogging of the water outlets. Worms should be excluded from the soil, and searched for in the pots if there are worm pests on the surface, as these creatures soon choke up the drainage. Before repotting, the roots should be carefully examined, and decayed parts cut clean away if found on the tap-roots, and if the Auricula aphid should be discovered on them, it will be prudent to wash the roots with soft soap and water before repotting them. Press the soil moderately firm around and amongst the roots, afterwards removing the plants to a frame on the shady side of a wall or fence, the lights being kept nearly closed for a few days until new roots have formed. We repotted all the offsets in the first week in May. Some of these will grow freely, and will be better for a shift into one size larger pots in June or July. With care the offsets of last year will grow into flowering plants by the end of this season; but they should not be over-potted at this period, for the sake of saving a repotting in the summer, or early in the autumn. Plants raised from seeds sown in July, 1889, are now freely growing, and require frequent repotting, unless they are intended for the open border. Auriculas do not require much attention when planted out, and if the soil in which they are grown is suitable, large flowering specimens will be produced by the end of the summer.

The cultural requirements of alpine Auriculas under glass are similar to those of the show varieties, but they are harder and not so readily injured by cold winds. Planted in the rock garden here, they are beautiful masses of crimson and gold. We have a clump of Gorton's Diadem in the rock garden, which produces at least a dozen trusses of flowers, and forms a picture of its kind not surpassed by any other alpine plant. They are also good subjects for the front rows of herbaceous borders. *J. Douglas.*

DOUBLE POLYANTHUSES.

I observe that the old double black Polyanthus is being advertised as "extremely rare." I have not seen it for a long time round London, but it may, and doubtless does, still abound in the cooler and moister parts of the country. The difficulty appears to be to keep it alive in the hotter and drier parts of the south. I began last summer with some strong plants in pots, and they were plunged in a bed of cocoa-fibre in the coolest and shadiest part of my garden, but died ere the summer was over. Evidently they could not stand the dryness and the heat. It is known in some parts of the country as Rex Theodore. This and a double reddish-brown variety laced with gold, known as Tortoiseshell, are the only two double Polyanthuses I am acquainted with. I have a strong plant of the latter in a pot, and it threw up strong trusses of bloom; but the flowers never became fully expanded. I had some trusses of bloom sent me a few days ago from Cork, the flowers very double, but only half expanded, and it appeared as if they would not get beyond this stage. It may be peculiar to the variety. I shall make an effort to keep the plant through the summer, and hope to succeed. I have seen a double Polyanthus come among some gold-laced seedlings, but not, to my knowledge, among a bed of the Giant or Fancy type. It is the same with the Primrose. Occasionally a variety will show a tendency to become double by throwing out petals from the tube, but the flowers are double only in a rudimentary form. Perhaps if the plants were isolated and seed sown, a race of semi-double varieties might ensue, as is observed in the case of the Chinese varieties. *R. D.*

CHEMICAL CONSTITUENTS OF APPLES.

In the recently issued *Bulletin of the Missouri (Columbia), Department of Horticulture*, an interesting article is given by Professor J. W. Clark on the chemical analysis of Apples of the variety Ben Davis, in order, as stated, to place before fruit growers in a concise and practical manner the ash analysis of Apples in its different stages of development, that the importance of thinning the fruit early and letting only the perfect specimens ripen might be made plain to all.

Three samples of the fruit were taken as follows:—

1. Made up of green immature Apples picked from the tree July 9, and averaging 1½ inch in diameter.
2. Taken October 23, and composed of large and perfect fruit, averaging 3½ inches in diameter.
3. Also taken October 23, and made up of small and imperfectly formed Apples, which averaged 2½ inches in diameter.

Analysis of Ben Davis Apples in Three Stages of Growth. Actual Quantities and Proportions per Cent.

	Unripe Apples.		Ripe Apples.		Small Apples.	
	July 9.	Oct. 23.	Oct. 23.	Oct. 23.	Oct. 23.	Oct. 23.
	Grains.		Grains.		Grains.	
Average weight of whole fruit	47	259.0	79.4	87.6	79.4	87.6
Weight of flesh in fruit	...	201.0	60.7	...	60.7	...
Weight of core in fruit	...	11.0
Weight of ash in fruit	...	5.51	4.03	1.81
Amount of flesh in fruit	Per cent.	Percent.	Percent.	Percent.	Percent.	Percent.
Amount of core in fruit	...	6.6	12.1
Ash in whole Apples	0.23	0.27	0.51
Carbon in same	2.35	0.91	0.52

From the foregoing data we learn that a large proportion of the mineral matter (ash) contained in the Apple is stored up during the early part of its growth, for, comparing the percentage of ash in the Apples collected July 9 with those of the ripe fruit collected October 23, we find the largest amount in those earliest gathered.

The ripe Apples are seen to contain two-and-a-half times as much carbon as the unripe ones; the small imperfectly-formed fruit containing quite an immaterial amount of carbon, scarcely more than a half per cent.

The following Table shows the analysis of the ashes of Apples at different stages of growth, the quantities of the various ingredients being given in parts per 100, and calculated in ounces in 10 bushels or 500 lb. of Apples:—

Major Constituents in Ben Davis Apples in three different Stages of Growth. Percentage Quantities and actual Quantities in ten bushels of Fruit.

	Unripe Apples.		Ripe Apples.		Small Apples.	
	July 9.	Oct. 23.	Oct. 23.	Oct. 23.	Oct. 23.	Oct. 23.
	Per cent.	oz.	Per cent.	oz.	Per cent.	oz.
Silica	0.53	0.13	1.23	0.26	2.16	0.50
Ferric oxide	0.47	0.11	0.46	0.11	0.66	0.18
Phosphoric acid	8.96	2.07	8.20	2.23	8.73	2.30
Lime	6.55	1.58	5.66	1.21	8.85	2.42
Magnesia	1.90	1.11	4.39	0.92	4.75	1.30
Potash	51.02	12.19	56.74	12.12	52.41	14.35
Soda	2.10	0.49	1.94	0.41	2.08	0.57
Undetermined	22.22	5.11	21.47	4.50	20.62	5.56
Total	100.00	23.12	100.00	21.76	100.00	27.36

The only ingredients contained in the ash which there is any need of noting, are the phosphoric acid, potash, and lime; for these are the only ones in which the soil is likely to become deficient, and therefore that need to be returned to the land to keep up its fertility.

From the above analysis we find there would be taken from an acre of land set with Apple trees, 30 feet apart, and yielding 10 bushels of fruit to the tree, by sample No. 1, 6 lb. of phosphoric acid, 37½ lb. of potash, and 4½ lb. of lime; by sample No. 2, 7 lb. of phosphoric acid, 57 lb. of potash, and 3½ lb. of lime; by sample No. 3, 7½ lb. of phosphoric acid, 43 lb. of potash, and 7½ lb. of lime.

From these facts we learn the importance of thinning fruit as soon as it is of sufficient size to show the wormy and imperfect specimens, and also that it costs less to grow a bushel of large and perfect Apples than it does to grow a bushel of small and inferior fruit.

It is further evident that to produce good crops of Apples for any number of years, the ground, when the trees are planted, must have phosphoric acid, potash, and lime, returned to it, if we wish to keep up production and fertility of the soil.

The cheapest and most available source of obtaining these substances, and applying them to the land, would in most cases be from ground-bones, marlate of potash, kainit salts, superphosphate, or wood-ashes. *J. J. Willis, Haverpound.*

RHODODENDRONS AT CASTLE KENNEDY.

The following remarks on Rhododendron growing were written by the late Mr. Fowler for Mr. C. A. M. Carmichael, who kindly sends them to us for publication:—

Rhododendrons are grown at Castle Kennedy in a great variety of soils and situations, for they are not, as many suppose, fastidious as to the former. A mellow turfy peat with a mixture of sand is perhaps the best, and a slightly damp subsoil; but as this soil cannot always be had, much may generally be done by taking advantage of the best substitutes for soil which the neighbourhood produces. Any loam, if not too heavy, mixed with peat, leaf-mould, and sand, may readily be formed into a compost fit for growing the Rhododendron. Ground which has been long occupied with American plants is apt to become exhausted, but a top-dressing of well-rotted manure or leaf-mould is a ready and cheap way of

rendering it again fit to grow the plants with beauty and vigour.

Somewhere over forty years ago, it was arranged that a low-lying piece of wet black moss from 2 to 3 acres in extent, surrounded on three sides with hanging ground composed of light loam on a gravel subsoil should be planted, and about 1 acre in the centre of the moss was formed into a circular basin, or pond, the peat soil being removed to and mixed with the loamy soil of the higher ground. The moss was thoroughly drained, and covered to the depth of about 12 inches with gravel and sand taken from the higher surrounding ground; the whole was well worked into the peat below and mixed with it. The ground was afterwards laid out according to a plan, and planted with *Rhododendrons*, *Azaleas*, *Kalmias*, *Andromedas*, *Ledums*, &c.; New Zealand Flax, *Pampus-grass*, *Arunda conspicua* have since been added, the whole forming now what is known as the "American ground." As years rolled on the moss consolidated, and, as a consequence, the beds sunk to some extent in the higher, and much more so in the lower parts.

A few years ago it was necessary to raise all the beds from 9 to 18 inches. About the same time we were carrying out some improvements in an old kitchen garden, originally a light loam, and had a large quantity of spare soil, which had been removed from the borders and breaks, which was full of manure. This was utilised to raise the level of the beds in the American ground, which involved a turn over of nearly all the plants, so as to raise the roots to suit the new levels, and admit of the old garden soil being thoroughly incorporated with the moss and gravel in the beds. The result has been all that could be desired.

In other parts of the grounds, in shrubberies, and along the sides of drives, *Rhododendrons*, &c., are planted in the ordinary soil. Where the finer-named varieties of the former have been planted, the ground in most cases has been trenched, but where the commoner are planted, as a rule but little preparation was made. The ordinary soil varies from a light to a hardy loam, resting on a subsoil of sand or gravel. I observe that where the subsoil is dry, they do best where there is partial shade, or are planted in a north or west aspect; but where the subsoil is moist, this is less important. Early varieties which flower before May I should be planted, when at all convenient, so as to be sheltered from the morning sunshine, except in the best localities.

Planters of the finer hybrid *Rhododendrons* should consider the climate of the localities where they propose planting. In inland and elevated situations, where they suffer from late spring frosts, only the late-flowering varieties should be grown. In more fortunate districts, particularly those near the seashore, or well to the southward, early varieties may be expected to succeed; and only in the best localities should the Sikkim species be introduced. Some of these are well worthy of cultivation, on account of their fine foliage alone, they being very effective when planted amongst other shrubs; and in particular is this the case with some of the many beautiful varieties of *Rhododendron cinnamomeum*. Some of the varieties and hybrids have open and upright habits, the long pointed leaves of which, slightly curved from the midrib to the edge, show the rich cinnamon colour of the back, and when the plants reach the height of 6 or 8 feet, admit the play of the sun's rays, which in certain lights become slightly charged with the cinnamon colour of the leaves. The effect produced by the play of the rays must be seen to be duly appreciated.

The following Sikkim varieties are comparatively hardy here, and, with the exception of the *R. cinnamomeum*, which flowers freely after being well established, the others only occasionally: *nivomum*, *cinnamomeum*, *Acelandii*, *barbatum*, *Thomsonii*, and hybrids, *nobilis*, *robustum*, *campanulatum*, *fulgens*, *argenteum*. Thousands of hybrid seedlings of Sikkim have been raised and planted all over the place; many of them are now a few feet in height, and show

great variety of foliage, particularly the cinnamon strain, but few of them have yet flowered.

The following are among the best varieties grown here of the finer hybrid *Rhododendrons*:—Sir Isaac Newton, Broughtonianum, Altaclarensis, Alarm, Earl of Rosslyn, Lady Eleanor Cathcart, Mrs. Williams, Lord Eversley, Caractacus, Perfection, Auguste van Geert, Sir John More. The above have large foliage and large trusses, and form grand specimens. Malame Carvalho, The Queen, Tipoo Sahib, Johnsonianum, Duchess of Sutherland, John Waterer, Kate Waterer, Earl of Shannon, Sir Robert Peel, W. E. Gladstone, Malame van de Weyer, Henderssonii, Mrs. John Penn, Prince Eugène, Elfrida, Hector, George Cunningham, Paxtoni, Raphael, The Princess Mary of Cambridge, Sir William Armstrong, Duc de Brabant, Sir Joseph Whitworth, Iago, San of Austerlitz, Etoile, Nero, Cato, Lord Stamford, Queen Victoria, Lucy Neal, Sultana, Titian, Star of England, Mirabile, The Autocrat, Nelsonii, The Warrior, Sir Thomas Sebright, Londonense, Alarm, Lady A. D. Stafford, Alma, Mrs. John Clutton, Purity, Richard, Rouge et Noir, Bouquet de Flora, Austin Layard, Baroness Lionel Rothschild, Chancellor, Countess of Normanton. Although not the newest varieties, the above have all been tested, and are worthy of the best nooks that can be given them wherever *Rhododendrons* are appreciated.

THE LILY OF THE VALLEY FUNGUS.

In the *Gardeners' Chronicle*, July 5, 1881, pp. 12, 13, Mr. W. G. Smith records and describes for the first time as British *E. blumii* convallariæ, Schum., from specimens which had been found by Mr. T. Hobden infesting Lilies of the Valley in the Lake district; the fungus had also been observed on the same host near Scarborough. Apparently this species is rare, for beyond the localities mentioned, it has not, I believe, been noticed elsewhere in Britain. In Plowright's *Monograph of the British Uredineæ*, 1880, it is placed in the Appendix, amongst imperfectly known forms, and evidently very little is known concerning this particular *Æcidium*.

During the past twelve months I have paid some attention to *E. convallariæ*, and by a series of experiments and observations have been able to trace out its uredo and teliospores. In the first place, it is clear that the *Æcidium*, cannot reproduce itself without the intervention of some other host. On June 13, actively germinating spores of the *Æcidium* were applied to the leaves of healthy plants of *Convallaria majalis*, which for three months were almost daily under notice. Not the slightest result followed. On the same date several strong rooted plants of *Convallaria*—the leaves of which were badly infested with *Æcidium*—were planted in my garden, but kept apart from the healthy plants. With the exception of the *Æcidium* clusters dropping out and forming irregular holes in the leaves, not the least result ensued.

To test how far these and other observations accorded with the fungus in a state of Nature, I visited in September, Bowness, a locality where the parasite had been abundant during the previous spring; a large number of leaves were collected and examined, which proved to be free from either uredo or teliospores. How then does the *Æcidium* reproduce itself? Without now going into detail, I may say that after infecting several species of plants last June, with actively germinating spores of the *Æcidium*, a result followed in the form of uredo being produced on *Phalaris arundinacea*. When ripe, these uredo spores were again applied to other plants of *Phalaris*, and uredo again followed, which in each case was succeeded in July and August by teliospores.

Moreover, *Phalaris arundinacea* was badly attacked—in proximity to the Lilies at Bowness—with uredo and teliospores identical with those artificially produced. On April 30, 1890, I applied germinating teliospores from *Phalaris* to leaves of

Lily of the Valley, which produced spermogonia on May 8. The experiment is being continued.

Specimens of the teliospores were sent to Mr. C. B. Plowright, of King's Lynn, last year. He informs me that he infected *Convallaria* on April 27, 1890, and saw indications of spermogonia on May 5, which were abundant on May 9. "I have grown," he says, "Lily of the Valley for eleven years in my garden, every year without any *Æcidium*, but eight days after sowing the teliospores the *Æcidium* begins to appear." So that it is beyond doubt that *Æcidium convallariæ*, Schum., furnishes another illustration of that remarkable phenomena known as "heterocicisim." *H. T. Sappitt, Bolton, Bradford.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CAMBRIDGE LODGE, CAMBERWELL.

The houses full of magnificent specimens of all the species and hybrids of *Cypripedium* in cultivation, as well as a large number of home-raised varieties peculiar to the place, are always the chief attraction in R. J. Measures, Esq.'s garden. Under the care of his gardener, Mr. D. Simpkins, the entire collection steadily progresses; but it is in the perfection of health exhibited in the foliage and flowers of the *Cypripediums* that the improvement is most marked. At the present time the varieties of *C. barbatum*—some of them rare—are of much interest. Among them the two most distinct is a quaint dwarf variety, with light-coloured flowers; and a narrow-leaved one with peculiarly bright and attractive flowers named *C. barbatum* Backhousei, it having been received from the York firm. *C. Burbridgei*, as seen here, is a fine and handsome species, with something of the outline of *C. Dayanum*, but with the dorsal sepal heavily striped with bright green, and the quaint-looking petals tinged with rose. *C. Cooksonii* ×, a Lawrenceanum cross, is, when well grown, a noble variety, and the best form of the typical Lawrenceanum, with two dozen large flowers, is indeed a fine object. *C. marmorophyllum* is beautiful both in leaf and flower, and among others are strong specimens of *C. Curtisii*, *C. ciliolara*, *C. venustum* ×, *C. Swainianum* ×, *C. bellulum*, *C. Druryi*, *C. superciliosum* ×, *C. Dayanum*, *C. comchiferum* ×, and *C. hirsutissimum*, in bloom. Noteworthy was the vigorous condition of the *Selenipedium* section—the broad handsome foliage of *C. Lindlevianum* equalling that of *C. grande* and *C. Ainsworthii* ×, and *C. Scholeræ* approaching it in strength.

Among plants of this section in bloom were noted many of the *Seleni* group, the prettiest being perhaps *C. S. candidulum*, although the richly-coloured flowers of *C. purpurascens* and *C. albo-purpureum* render them very desirable varieties. A large specimen of *C. Dauthieri* *marmoratum* was observed, which exhibited the danger of moving plants to other houses when really doing well. It may be noted that the specimens of *C. Spicerianum* grow luxuriantly in a corner allotted to them, and have always resented removal to other houses. So also with large pots full of *C. Druryi*, with their vigorous trailing growths. Convenience suggested their removal to the next division some time ago, but they had to be brought back, or they would have gone into ill-health beyond recovery, although no difference in the temperature, &c., could be remarked.

Next in importance to the *Cypripedia* is the large and complete collection of all the species and varieties of *Masdevallia* and *Plourotallia* obtainable. Among the former a charming little new species of the *M. simula* class is in bloom, with flowers far surpassing those of *M. simula* in beauty, their markings being like those in *Restrepia antenniferæ*. Also in bloom, and well advanced in bud, are *M. pachyantha*, *M. leontoglossa*, *M. demissa*, *M. Chestertonii*, *M. punctata*, *M. civilis*, *M. Peristeria*, *M. Houartiana*,

M. cupularis, *M. Fraseri* × *M. ignea* Eckhartii, and a great variety of the *M. Harryana* and *M. chimera* section. Continuing the course he adopted with his *Cypripediums*, Mr. Measures has in the course of printing a neat little list of his *Masdevallias* and *Pleurothallis*, with references for identification which will be of service. Among the most curious now in flower are two of the section *Scaphocephala*, viz., *M. pulvinaris* and *M. antennifera*, both with ragged scapes, and flowers a little resembling a hawk's beak. A curious new *Stelis*, with flowers unusually large for that genus, was in bloom.

Time admitted but of a glance through the house of fine *Vandas*, which contained some rare forms of *V. suavis* in bloom; also *Acriodes rubrum*, and a plant of *A. Fieldingii* with seven spikes; the *Cattleya*-houses with their quota of *C. Mendelii* and *C. Lawrenceana*, and their sturdy specimens of the *C. aurea* and *C. gigas* type, two of which are white forms of *C. gigas*.

The house of *Miltonias*, with scores of fine spikes on the healthy specimens of *M. vexillaria*; the house of *Phalanopsis* in vigorous health, and that containing the specimens of *Cymbidium Lowianum* and other *Cymbidiums* were visited, all of which contained some good plants in bloom, as the white form of *Trichopilia suavis*, Dr. Paterson's fine variety of *T. coccinea*, *T. crispa*, and *T. marginata*.

In one cool house was a pretty group of the lovely little *Occhioleum cucullatum*, *O. Phalanopsis*, and *O. coccolur*. In another shady cool house *Utricularia montana* had assumed unusual proportions, and was blooming profusely. *Warszewiczella cochleata* and *Koelersteinia graminea* were in bloom; also *Ornithocephalus grandiflorus*; and among the *Corydanes* the charmingly tinted *C. tomentosus* had seven fine sprays of its salmon-pink flowers. The unheated house of *Todea superba* is also another success which may be added to Mr. Simpkins' cultural achievements.

"LINDENIA."

The last number of this periodical is devoted exclusively to the illustration and description of certain forms of *Cattleya Trianae*, viz., *C. Trianae* var. *purpurata*, t. 229; *C. T.* var. *Madame R. Martin-Cabuzac*, t. 230; *C. T.* var. *pallida*, t. 231; *C. T.* var. *striata*, t. 232. Descriptions of these are given by Mr. Rolfe. Among the numerous forms of this species, which is, botanically, itself only a subspecies of *C. labiata*, are *C. T. Lecana*, which is the largest; *C. T. choconensis*, the most strongly perfumed; *C. T. virginialis*, the purest white; *C. T. Russelliana*, the most remarkable for the rich colouring of the medium lobe of the lip; but, as Mr. Rolfe remarks, there are so many fine forms that comparison is difficult, and the names represent individuals rather than varieties.

CATTELEYA BALLANTINIANA ×.

A splendid hybrid raised in Messrs. Sander & Co.'s establishment out of *C. Trianae* by *C. Warszewiczii*. The sepals and petals are of a beautiful deep rose colour, and the elegantly frilled lip is washed with the same colour on each side. The disc is pure white with a bright yellow stain at the base, where there are a few radiating dark purple lines, while the anterior spreading portion of the lip is of the deepest mauve-purple, shading off into a paler conspicuous border, which is at once characteristic and attractive. *Reichenbachia*, t. 91.

CYPRIPEDIUM VITTATUM BREVE.

Also known in gardens as *C. Dinoti*, is a pretty form, figured in the last number of the *Orchidophile*. It belongs to the subgenus *Selenipedium*. The flower is between 3 and 4 inches in the longest diameter, with an oblong-acute upper sepal marked with fine purple lines on a greenish ground; the two lower conjoined sepals have a similar ground colour destitute of lines, but with a few scattered small purplish spots. The lateral petals are 3 inches long, deflexed, linear, strap-shaped, twisted, undulate, and hairy at the margins, and of a purplish-red

colour. The lip is of like colour, the side lobes streaked horizontally with irregular bars of purple. According to Mr. Binot, as quoted in the *Orchidophile*, the plant grows in marshy places, exposed to the full sun; its roots are almost constantly in stagnant water, overlying a compact clayey soil. It is a native of Southern Brazil, whence it is likely soon to disappear from the devastations of collectors. *M. Godefroy* says it should be grown in a stove with a constantly very moist atmosphere.

DENDROBIUM BRYMERIANUM.

A brief and interesting story is told in connection with the introduction of this species. It is a native of Barmah, and *Orchid* collecting in that country some years ago was by no means an agreeable occupation. The collectors had a warm time of it in more ways than one, owing to the rivalry of the missionaries established there, and who knew the value of *Orchids* to some extent. They did not accord a genial welcome to a stranger in search of them. Indeed, they forbade him to leave the town of Bhamo, and he was, therefore, obliged to hire natives to procure plants. It may be readily imagined that the collector was not always in the best humour, having nothing to do all day long but flying from one to the other of the four gates by which the town of Bhamo was entered, in the hope of seeing one of his agents approaching with the much-wished-for plants. The proceedings were occasionally enlivened when one of the said agents was intercepted just outside the gate, and had all his plants taken away from him. These little incidents often led to anything but edifying scenes between the collector and the missionaries or their agents. However, some *Orchids*, among them *D. Brymerianum*, were sent to England, probably by the missionaries. No descriptions being given, the plants were consequently sold cheap, nobody suspecting for a moment that anything remarkable was amongst them. Mr. Brymer was fortunate to obtain some of these, and we can understand his feelings when he saw the plant which has immortalised his name in *Orchid* circles open its extraordinary flowers." *Reichenbachia*, t. 92.

CYPRIPEDIUM DELICATULUM.

This pretty variety raised by Drexell O. Drexell, Esq., Kiding Mill-on-Tyne, by crossing *C. Dayanum* with *C. barbatum* Warneri, is now in flower with Messrs. Seeger & Tropp. It much resembles *C. Dayanum*, but the dorsal sepal has more white in it, and the whole flower is of a more delicate tint.

MASDEVALLIA HARRYANA, KENTISH FINE.

This gorgeously tinted form of our showiest *Masdevallia* is now in flower in Messrs. Seeger & Tropp's *Orchid* Nursery, Lordship Lane, East Dulwich. It is rather a tall grower, and its large handsome flowers have that rich glow which comes of the crimson surface colour being over the yellow tint of the body of the flower.

AURICULA (SELF) BUTTERCUP.—This is a fine and smooth deep yellow-coloured self, and having a marked individuality of character, standing among the varieties in this section as their equal for its obvious good qualities. It was the only show variety at the recent exhibition of the National Auricula Society that obtained a First-class Certificate of Merit. There was at one time in cultivation a yellow self named Gorton's Stadt-holder, and, indeed, until recently; but I doubt if it be now possible to get a plant of it. I saw it on one or two occasions long ago, good in colour, but thin in the paste and substance. Until Buttercup appeared the best yellow self was *Il-tty* Dean, a seedling of the Rev. F. D. Horner's, which he gave away. This is a good grower, flowers early, tube and paste good, and it lasts a good time when in bloom. Mr. Horner raised and named a pale yellow self named Sunshine, but it lacks the depth of colour, and the density of paste, and the stoutness of *Il-tty* Dean. Buttercup came among a batch of selfs, and it illustrates the fact of variation in the Auricula, that a yellow self should be produced from parents essentially distinct in character. *R. Dean*.

TREES AND SHRUBS.

[See illustrations in this and the preceding number.]

BERBERIS DULCIS.

For freedom to flower and gracefulness of habit, *Berberis dulcis* is a gem for the shrubbery, and especially when planting at the back part of the border. The growth is more upright than spreading, and the plant is just the one for such positions. When young, and about 3 feet high, half a dozen may be planted together, thus obtaining good effects without loss of time; and this is better than dotting the plants about amongst other shrubs. When the bushes have outgrown their bounds at the front part of the shrubbery, a permanent site should be selected for them at the back. *E.M.*

EARLY FLOWERING SHRUBS.

If I had to give an opinion as to which is the best early-flowering hardy shrub, I think I should decide in favour of *Ribes*, for what can be more effective than the flowering Currant, with its long graceful racemes of rich-coloured flowers? These vary in shade from deep crimson to white. I have often thought, when admiring these beautiful *Ribes*, what a high value would be attached to them if they were tender, or required stove treatment. Here we have been applying the flowers for table decoration, in combination with long shoots of *Deutzia gracilis*, and the two together, in tall eperges, associate well. As pot plants, the *Ribes* are very serviceable for furnishing, and the wonder is that they are not grown in that way and sent to market to brighten town windows, as they could be got up quite large enough in one season. All one has to do by way of propagation is to make cuttings, or pull off slips of the young ripened wood, any time in the autumn, and stick the pieces in the ground, and in spring they will root and grow, and make nice little plants.

BERBERIS.

I should place these second in my selection, because they are later in flowering; but when they do come in, they made a fine show. Not only is this so, but the old well-known *B. aquifolia* is so valuable for planting under trees, as it will thrive where hardly anything else will live, and its branches, with their handsomely cut foliage, that colours up so beautifully, is of great value for cutting for vases. *B. Darwini* is simply splendid; a mass of bloom all aglow with warm-coloured flowers, that hang in abundance, and quite light up dark places. This *Berberis* is well adapted for planting at the back of shrubbery borders, or in *Rose* borders which have a backing of evergreens, as it does not root far about, and may be kept to any size by pruning it in. *B. stenophylla* × is in no way inferior to the above, and should be in every garden, it being very distinct in habit, and well adapted for planting on rockwork or elevated positions, the long pendulous branches making a good show. The best time to plant *Berberis* is just before they begin to grow, as they are difficult to move successfully before that time.

MAY FLOWERING TREES AND SHRUBS.

The early flowering *Rhododendrons* have been repeatedly injured by frosts in this neighbourhood, so much so, that at their best they have made but a poor display; but as *Rhododendrons* comprise so many sections, which bloom in long succession, those now opening and those to follow will soon impart a different aspect to the shrubberies and pleasure-grounds.

The wild Cherry, covered profusely with its snowy-white flowers, is a good subject for the back parts of shrubberies, and looks well on the skirts of plantations of *Firs* and other trees. The double variety, *Cerasus pseudo-cerasus*, *albus* Watereri, with its large, double, rose-coloured flowers, is very handsome. (See fig. 199.) *Magnolia purpurea* has this year escaped the frosts, and is at the present time a mass of bloom. This species, when grown in the shrubberies and backed up with the foliage of green

Hollies or other shrubs, shows itself to perfection. Lilacs are opening, and are always welcome. *Daphne mezereum* is all but out of flower, and is seen only in old gardens. *Berberis Darwini* has been covered with bloom for some time past, and on this, a light sandy soil, they grow very luxuriantly, and is a very desirable object to plant.

to the above, which should occupy a position in every large garden with grounds; for besides embellishing the grounds themselves, their flowers are extensively employed for decorating the rooms, where they are ever welcome. Gardeners would all do well to note and plant more flowering trees and shrubs. The increased taste and demand for flowers by employers

plenty of space to develop, its lower branches will in time sweep the turf. The height of the tree mentioned is 20 feet, and the breadth as much in the widest part. The Crab flourishes in stiff soil, and flowers freely almost every year if the bullfinches are driven away, these birds being partial to the buds in the early spring. When laden with its bright

FIG. 107.—CHOISYA TERNATA: SPRING FLOWERING SHRUB: FLOWERS WHITE. (SEE P. 644)

Camellias have flowered better than usual, the opening of the bloom having been retarded by the continued cold weather. There are still many varieties of flowering subjects to keep up a succession of bloom, such as *Deutzia crenata*, and its double variety; *Laburnums*, *Choisya ternata* (fig. 107), *Almonds*, *Broom*, white and yellow; *Syringa*, *Weigelas*, *Spireas* (woody varieties), *Azaleas*, *Gueldras Rose*, *Crataegus*, &c. There are many others in addition

often elicits the question, Why don't you plant more flowering shrubs? *D. C. Powell, Powderham.*

SIBERIAN CRAB (*PYRUS PRINIFOLIA* VAR.).

We have here growing on the lawn a good specimen of this species of Crab, which is now coming into flower. As a lawn plant it is a particularly good subject, and should always be included amongst a collection of deciduous shrubs. When given

golden coloured fruit this species of Crab is ornamental, and useful as well. *E. M.*

CHLOROPHYLL IN BURIED LEAVES.—At a distance of 20 feet below the surface, a bed of leaves has been discovered while digging the Manchester Ship Canal. The green colour was still preserved, and has been found by Dr. Schanck to be due to modified chlorophyll.

COLONIAL NOTES.

SEASIDE PLANTS NEAR MELBOURNE.

ABOUT five miles from the General Post Office is a favourite marine suburb, St. Kilda, where reside many well-to-do citizens, who, as also visitors, find relief and relaxation in leisure hours after the rush and turmoil of business in the city. Here, free from dust, raised by the hot (generally north) summer wind, they, as well as numerous visitors can, if they will, visit the Esplanade, lounge on the pier, watch the movements of the various yachts, or, as the Public Baths and boats are near by, may take a "header," or arrange for a sail in Hobson's Bay, whichever way inclined.

Very little indeed has been done by way of planting trees and shrubs, either for shelter or to stay the drift sand; the latter, by the way, is not so troublesome as at some other portions of our bay shores. However, as it may interest some of the readers of the *Gardeners' Chronicle*, I quote the names of various plants growing in positions, either in the public streets or on private properties near by the sea, and in many instances in the sand almost close to the water's edge. These, as will be observed, are not all natives of our country, but in the main introduced species, as per following list of plants, growing not only near St. Kilda, but also in other places not far from Melbourne on our bay shores:—

- | | |
|--|---|
| 1. <i>Acacia pycnantha</i> | 20. <i>Nerium oleander</i> |
| 2. <i>Agave americana</i> | 21. <i>Olea europæa</i> |
| 3. <i>Alcea arborescens</i> | 22. <i>Paspalum distichum</i> |
| 4. <i>Artemisia coccinea</i> | 23. <i>Phoradendron toxi-</i> |
| 5. <i>Arundo donax</i> | 24. <i>Pinus halepensis</i> |
| 6. <i>Banksia integrifolia</i> , and
others | 25. " <i>insignis</i> |
| 7. <i>Casuarina quadrivalvis</i> | 26. " <i>pinna</i> |
| 8. <i>Crotophea</i> — <i>Baueriana</i> ,
and others | 27. " <i>planchetii</i> |
| 9. <i>Corynocarpus levigatus</i> | 28. <i>Psittosporum engeli-</i>
oides |
| 10. <i>Cupressus Lambertiana</i> | 29. " <i>undulatum</i> (others,
such as <i>Tobira</i> ,
<i>crassifolium</i> ,
would suit well
also) |
| 11. <i>Cuscuta dactylon</i> | 30. <i>Ribes coccinnea</i> |
| 12. <i>Echium danthii</i> | 31. <i>Salix babylonica</i> |
| 13. <i>Eugenia myrsinifolia</i> , and
others | 32. <i>Schinus molle</i> |
| 14. <i>Ficus laevis</i> | 33. <i>Spondylis hirsutata</i> |
| 15. " <i>macrophylla</i> | 34. <i>Tournefortia guilfordi-</i>
diana |
| 16. <i>Ipavea arborea</i> | 35. <i>Ulmus europæa</i> |
| 17. <i>Leptospermum levigatum</i> | |
| 18. <i>Ligustrum vulgare</i> | |
| 19. <i>Melaleuca pallida</i> | |

Those most suitable for exposed positions near the sea shore are Nos. 1, 2, 3, 4, 5, 6, 7, 8, 11, 16, 17, 18, 19, 21, 25, 26, 27, 33, and 34. To these may be added many of the others not growing so near the sea, but which stand exposure very well indeed; but which, however, need some protection. No. 17 is unquestionably one of the very best hedge plants for a seaside position, and as it bears clipping very well, is very largely used by residents on our shores, both as a sand stay plant and for shelter, under the cover of which other and more delicate plants may be freely grown. This can be raised freely from seed, but the usual plan of securing sufficient for hedge purposes is to dig up young specimens out of the sand hummocks and replant them. The common name for this myrtaceous plant is the broad-leaved coast Tea Tree. It succeeds very well also in ordinary light or loamy garden ground more inland. *A. C. N., South Yarra, Melbourne, February 26, 1890.*

FOREIGN CORRESPONDENCE.

RARE FLOWERS IN C. G. VAN TUBERGEN'S GARDEN.

AMONG interesting plants now in flower in my garden may be mentioned the recently figured *Eremurus himalaicus* (*Bot. Mag.*, t. 7076), a choice member of this fine genus of Liliaceous plants; the strong spike, rising to a height of about 4 feet, bears a raceme of hundreds of pure white flowers, and measures nearly 2 feet in length; it is quite the sturdier plant now in bloom with me. *E. Bungei* and its fine variety *perfectus* are also sending up very stout spikes; these promise to be grand in the

course of June. My plants appear to have derived especial vigour from the very warm and dry early summer of last year. On heavy, sticky soils, difficulty is often experienced in keeping their tubers and long fleshy roots in sound condition during the winter; but planted in a well worked soil, where water cannot long be stagnant, and their tubers slightly covered with reeds or a thin layer of leaves, to guard them against too sudden fluctuations in temperature, they will thrive in any garden, provided the situation be a sunny one. I also expect the flowering of *E. tauricus*, not the plant which has been pronounced by Hooker as synonymous with *E. spectabilis*, but of the original species, as first described by the botanist Steven. *C. G. van Tubergen, Jan., Swanenburg, Haarlem.*

IRIS IBERICA.

RECENTLY walking across the nurseries of Messrs. Ant. Roozen & Sons, at Overveen, I saw the *Iris* above-mentioned in full flower, which, whilst looking most singular, is yet very handsome. The flowers are very large; the standards white, spotted with pale violet; in contrast with this the drooping falls, which are yellowish, veined with dark purple; a beautiful dark blotch is in the centre. This species of *Iris* is easier to cultivate than most persons imagine, and it is perfectly hardy in England. It grows very well on rich sandy loam in a warm aspect, and the rhizome should not be planted deeply, and in winter time it should be kept dry. *T. K. Budge, Haarlem, Holland.*

THE APIARY.

BEES appear to be very strong this year, and if we only have propitious weather, a great deal of honey must be expected. Many swarms have issued already from skeps in this neighbourhood, and such swarms ought to do well. The best way to treat them is to put them into the hive where you intend them to remain, and then put the swarm on the old stand, removing the parent hive some distance off; by this means the swarm receives the whole of the flying bees from the parent hive, while the latter is so weakened down, that it will probably not swarm again, which is much to be desired. If it happens that the hive has been supered before the swarm issues, the super would be deserted, and it would be useless to keep it on the parent hive. The best thing is to remove the super, and put it on the swarm at the same time the swarm is hived. It will, no doubt, happen that the supers are taken to at once, and brood-rearing will go on down below, while honey-storing is going on above. I have occasionally had bees which will neither swarm nor work well. In most cases bees are industrious, but that is not always the case.

Sometimes bees get their hives filled with honey quite early in the season, and then refuse either to work or swarm. In such a case, I have before now made an artificial swarm, and thus cured them. This is easily done. The elements of success are, two hives full of bees, and the presence of drones in the apiary. We have mentioned this before, but it is so useful, that it will bear repetition. About the middle of a fine day go to one of these lazy hives, and remove the frame containing the queen, and put it into an empty hive, filling up the hives with frames of foundation. Put the hive thus treated on the old stand. Now take the hive which has been robbed of its queen, and put it on the stand of another lazy hive, if you have it (or some other), and remove that hive somewhere else. All will now be complete. Hive No. 1 will contain a queen, a little brood, plenty of bees, and enough room to keep them employed; No. 2 will have the bees of another hive, and plenty of brood, but no queen. This they will supply by building queen cells at once; the other hive will contain queen, plenty of brood, and a lot of young and hatching bees; thus, all will have something to do, and no doubt all will do it, or they

would run short of winter stores. The same system can easily be adopted with skeps, only in that case the first hive operated upon would have to be driven. Everything else would be the same. *Agnes.*

PLANTS AND THEIR CULTURE.

GREENHOUSE AND MISCELLANEOUS PLANTS.—During the next few weeks much of the work will be found in producing plants for autumn and winter display. A sowing of *Primulas* should be made to form a succession to earlier sown plants, and time should not be lost in getting the early seedlings shifted into pots and placed in light position to keep them sturdy. Most seedlings should be pricked off as soon as they are large enough to handle. The double white *Primulas* should be making good progress if they were taken off as advised a short time back, but if propagation is not yet begun it should be undertaken now. The young plants need a little warmth in a close pit for a short time, and to be watered very sparingly. The old double white *P. sinensis* is the best for cut flowers, and the flowers resist the evils of fog better than any other.

A large sowing of *Cinerarias* should now be made to supply the mid-winter flowering plants. The seedlings must have every care, but beyond saying that no check to health must be allowed, any further directions as to culture would be superfluous. A cold frame will be the best place for them at this date. A later sowing should be made in July for spring blooming, putting the seed-pans in a frame facing north. Cuttings from named plants should be potted off when rooted, and kept clean by weak fumigation with tobacco. The same remarks apply to the herbaceous *Calceolarias*. A pinch of *Calceolaria* seed may be sown in a short time, if very early or large plants are required; but it is best to defer sowing till July for the main supply of plants. We usually sow a small quantity as soon as the seed ripens. When sowing the seed, the soil should be thoroughly moistened before sowing, and so avoid after-waterings during germination. The seed-pans should be stood on pots, to prevent slugs reaching them, and covered with a piece of glass. A trial of the new winter decorative plant introduced recently, *Kalanche carnea*, should be made by sowing seeds at once, if not already done. This is a dwarf *Daphne*-like plant, easily raised from seed, valuable as a winter bloomer, and what is better, it suits many who have not a stove, as it will do well in a warm greenhouse. It is very fragrant, and its charming pink flowers are sure to be appreciated.

Now is time to sow seeds of *Impatiens Sultani*. Cuttings from this species of *Impatiens* do not make so good plants for winter work as seeds. The seeds require great care to be taken, and not to be excessively watered, as this would cause them to rot or the plants damp off. Sow in heat in a light compost, and prick the seedlings off into 6's when large enough to handle, potting them on, into 7 or 8-inch pots, and using good loam. Frequent stopping, and manure-water as they fill their pots with roots, are essential. In winter the best place for the plants is an intermediate-house.

Berried *Solanums* may be sown, if good-sized plants are wanted, or may be propagated by cuttings. Much time is saved by raising plants, and when large enough, hardening them off before planting them on a warm border. If the plants are mulched in the summer months, they will be much benefited.

Salvias may be potted on as required, using turfy loam with a sprinkling of 1-inch bones—a light compost causes the plants to grow weakly. Cuttings struck at this time will make nice plants in 6 or 7-inch pots, that may be made use of where larger plants would be out of place. These plants will do well in a cold frame when they are well established, finally plunging them in the open ground early in June. Cuttings of *Abutilons*, if grown for winter work may now be struck—*Bottle de Nègre* and *Darwinii* are good for this purpose. The treatment accorded to *Salvias* during the summer months suits these plants. Strong cuttings of *Carnations* may be struck on a slight warmth.

Daphnes should now be growing freely in an intermediate house, and when their growth is finished they should be placed where the shoots may get ripened off, that is, in a cooler house. Chrysanthemums should be potted on as they require it; they will now do in the open, giving plenty of space. Care should be taken to repot them before getting potted, employing a rather strong loam, soot, and bone-dust. Give the plants support with stakes, and watch them carefully for appearance of mildew or green-fly. *Geo. Wythes, Sign House, Bradford.*

THE ORCHID HOUSES.

INTERMEDIATE HOUSE.—*Dendrochilum filiforme* now sending up its flower spikes, grows freely when potted in sphagnum moss and peat, with a liberal addition of potsherds broken small. *Dendrochilums* need much water at the root, and should never be allowed to become dry for any length of time, and the plants may be thoroughly syringed every morning, thereby effectually keeping down red-spider, to which they are very subject in a dry atmosphere.

Odontoglossum grande now pushing its growths will need great care lest it get overwatered at this season, and should this mischance occur, the young growths will certainly "spot." The plant should never be watered unless the surface of the potting materials is quite dry. *Cologerya barbata* should receive copious supplies of water at the root, but none should be allowed to settle in the hearts of the new growths, or the flower spikes will quickly decay; *C. Gardneriana* is rather a miffy subject, which I have tried in vain in nearly all my houses, but at last I have got it to grow by hanging it up in the intermediate-house. *Cypripedium Sedeni* and its varieties, *C. Harrisianum*, *C. villosum*, and *C. insigne Maulei*, now growing vigorously, should be thoroughly drenched with the syringe every morning; and no one need be afraid of doing this, if the plants receive the necessary amount of air, as rotting from overhead syringing will then never ensue. The syringe should be freely used among plants of *Vanda tricolor* and *V. suavis*, a dry atmosphere being inimical to these plants at any season, and more especially during warm weather. These *Vandas* should be so arranged in the house that the shading may readily be run over them without covering the whole roof in doing so.

Vanda exulata should be placed in a very light part of the house, and close to the ventilators, as nothing prevents "spot" so well as a good circulation of air around them. Look out for thrips on plants of *Miltonia vexillaria* in flower if in a dry house. A camel's-hair pencil and an insecticide are the best remedies until the plants are out of flower, when dipping in tobacco and soft-soap water may be practised. Keep a minimum temperature at night of 62°, with a rise of 10° to 15° by sunlight. By some inadvertence the word *not* was left out of the first line of the end paragraph in the last Calendar, thereby entirely altering the meaning of the sentence, which should have read *Cattleya Sanderiana* not showing or sending up flower-spikes. *A. G. Cull, Parkhill, Worcester.*

FRUITS UNDER GLASS.

THE PEACH.—The earliest started Queens, if well prepared, now near the ripening stage, may gradually have the water supply at the root reduced, and a freer ventilation adopted. Such of the plants as may be still swelling, should have liquid manure alternately with guano-water of medium strength afforded them, the roots being kept fairly moist—any overwatering, it should be remembered, being detrimental to good flavour. Syringing overhead should not be so heavy as to fill the axils of the leaves with water. The surface of the hotbed, walls, floor, and other surfaces may be frequently damped on sunny days, and occasionally liquid manure may be employed for this damping down, pines reveling in an atmosphere charged with ammonia. Any other varieties of Pine-apple which may have been pushed forward with a view of slightly resting them during the present month, in order to induce them to start early into fruit in the winter, or earlier if that is desired, should have the bottom-heat gradually reduced to 70° or 75°, and be kept unexcited, but the roots not to be kept so dry as those that were rested at an earlier part of the year. In most pine-stoves a slight shading of the glass will be necessary during the brightest portion of the day, and but very little

fire-heat, unless the nights are cool. Of course the necessary bottom-heat must be maintained.

Where Pine-apples are wanted the year round, pot-grown plants are best, in that fruits coming in about the same time may be retarded or hastened, as requirements may demand. On the other hand, should a large number of fruits be required, say, in the autumn, 1891, if good rooted suckers be planted out within the next two months, and well handled, they will give good results. Successions potted in February should now have their roots in contact with the sides of the pots, and will require more water than formerly, liquid manure being afforded them occasionally. Suckers may be put in as they become large enough. Keep the bottom-heat at 55°, and the atmosphere at night at 70°, and by day at 80°, running it up to 100°, with abundance of moisture, at closing time, and giving a small amount of front air at 9 P.M.

Melons.—Plants with fruit commencing to colour should not be watered at the roots, and all syringing should cease, the bottom-heat being kept at 80°. Cut the fruits when the foot-stalk is cracked all round, and put them, as soon as they are ripe, into the dessert, but if they must be kept for a few days, cut them before they are quite ripe, and keep in a cool dry room. The finest fruits are grown in soil and manure made as firm as possible, and over hot-water pipes, with but little water afforded them at the roots. Still richly flavoured Melons may be grown in turfy loam and bone-meal firmly rammed together, but without the dung, and when thus treated the growth is wiry and firm, and, therefore, less liable to canker or damp off. Under this latter method of growing the Melon, a little more time is required than by the former. Pay constant attention to the stopping, training of the shoots, and the fertilisation of the blossoms on young plants; and make fortnightly sowings. Thoroughly syringe the plants on fine days at closing time, open the front ventilators a little at night, and maintain a temperature at night of 70°.

Cucumbers.—Sow seed and plant out successions, keep the bine in order, and give ample space for the growth of the foliage which is retained. Cucumbers require less ventilation than Melons, and more atmospheric moisture and liquid manure. If any Cucumber plants have been overcropped, and are free from insects, thin out the shoots, allow the plants a short rest, and a mulching of spent Mushroom bed manure and turfy loam to restore their vigour. *W. Cramp, Madresfield Court.*

THE HARDY FRUIT GARDEN.

THE FIG.—If the trees have been allowed time for doubtful shoots to show their fruitfulness or the reverse, an examination should now be made, and dead points shortened back to good buds, so as to ensure bearing shoots for next year, and those which are left should be fastened to the wall. The roots may have a light mulching of fresh stable-manure, to be followed, if the weather demand it, by a good watering with warm water, which will have a stimulating effect at this stage. Figs on walls or the open quarter do not require extensive borders for their roots, but the drainage of the soil should be good, and their nutriment should not be stinted, but sufficient for the maturation of the fruit without producing gross shoots. In places where the Fig has fruited freely for some years, the let-alone system has been followed with the results that the trees made much weak useless sprays that exclude warm fresh air, and on which fruit could not reasonably be expected to form.

The Raspberry and the Strawberry.—These two moisture-loving plants should not be overlooked now that the blooming time is approaching, and dryness of the soil permitted, which is one of the direct causes of failure, especially with the Raspberry; and in their case, and if the land be sandy or resting on a porous subsoil, a good mulching of manure should be given, and a thorough soaking of water afforded the plantations, and again when in fruit. Strawberries in some localities are subject to mildew, more especially the Black Prince. When mildew is observed, a dusting with sulphur is the best remedy, and where slugs are troublesome, soot is a good remedy.

Currants.—The fruits of the red and white varieties are sometimes spoiled by aphid excrete, which, when exuded, is clear and sticky, the stickiness

causing dust and dirt to lodge, which, after a short time, forms a thick coating on the fruit. To prevent this, the tips of the shoots should be cut away, as it is in these that the aphides are to be found, but these should not be shortened very much, or the loss of foliage will check the growth of the fruits. In dry soils these fruit bushes and those of Gooseberries should be mulched with clean materials, to prevent the rain from splashing the soil on to the fruit. The fruit on the under-branches of the bushes should be thinned, or, better, cleared for tarts, for which there is generally a great demand; it greatly assists the trees to produce fine well-ripened fruits. *A. Evans, Lythe Hill, Huddersfield.*

THE KITCHEN GARDEN.

TOMATOS ON WALLS, &c.—The plants intended for fruiting outside, and which up to this date have been housed in some of the forcing-houses, should be removed to cool pits or frames for a course of hardening them off before planting outside. If the plants have been shaded by the foliage of Vines, Peaches, &c., they should, until the leaves become hardened, be slightly shaded for a few hours; and supplied with plenty of tepid-water at the roots, and occasionally of manure-water if at all pot bound. In warm localities they may, by the end of the month, be planted out; but in cold parts the first and second week in June will be time enough to plant with safety. Against a south wall is the favourite place for Tomatoes; but a sunny border will also do if attention be given to stopping and training the shoots. I usually plant them on a sheltered border in twos and threes, according to the size of the pots, in which they have grown, and allow a distance of 4 feet between the clumps. A selection of the "old red" is the best for the open border, and the large smooth fruited varieties for the south wall. On the wall the plants may stand at 1 foot apart, and be trained with a single stem, either upright or obliquely. Much manure should be avoided, and the soil made firm, so as to prevent as much as possible rank and unfruitful growth.

Cabbage Savoy, and Chou de Bruxelles.—For succession, a sowing of the above should now be made, and in many instances the produce will be found more serviceable than the larger heads of earlier raised plants, which, if not cut when ready for use, split and rot. The seed should be sown rather thinly, and the seedlings, when large enough, planted where they are to remain. Some of the dwarf hardy varieties will be found best for this sowing. Plant out Red Cabbages raised in heat at once, or they will not make hearts.

Cabbages.—For drawing during the summer months, make another sowing of the Early Nantes, choosing a cool position for the bed, and well covering the seed with wood-ash or burnt garden refuse.

Peas.—To prolong the supply from the old roots, and obviate a scarcity before the new crop comes into use, give the soil a drenching with manure-water, or apply a dressing of guano, and remove all the flower spikes as fast as they appear, plying the hoe between the rows of plants. Thin out the young crop of plants, when large enough, to 8 inches apart. The thinnings may be picked out if required.

Onions.—The varieties of Tripoli, when full grown, should have their tops bent down, and the flower-heads cut off, or good bulbs will not form. *H. Mitchell, Mereworth Castle.*

"INSECTS INJURIOUS TO FRUITS."—We desire to call attention to the second edition of a work published under this title, and prepared by Mr. SAVIGNES, the Director of the Experimental Farms of the Dominion of Canada. It is published by J. LEPPINCOTT, 10, Henrietta Street, Covent Garden, and, though specially designed for use on the other side of the Atlantic, is likely to be very useful also on this. Four hundred and forty woodcuts illustrate the foes and friends—for many insects are friends—of the Apple, Pear, Plum, Peach, Apricot, Nectarine, Cherry, Quince, Grape, Raspberry, Blackberry, Strawberry, black, white, and Red Currants, Gooseberry, Melon, Cranberry, Orange, Olive, and Fig. The means of combating these pests are also enumerated.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

WEDNESDAY, MAY 28, Nursery and Seed Trade Association: Annual Dinner at the Guildhall Tavern, Grace-church Street.

SHOWS.

WEDNESDAY, MAY 28, Royal Horticultural Society's Summer Show in the Inner Temple Gardens (two days); also Committees meet. York Exhib'ns.

SALES.

WEDNESDAY, MAY 28, Greenhouse and Bedding Plants, at Protheroe & Morris' Rooms.
THURSDAY, MAY 29, Orchids in Flower, and Imported Orchids, from Burnish, &c., at Stevens' Rooms.
FRIDAY, MAY 30, Imported Orchids, also Orchids in Flower, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—57° 3.

LAST autumn, the Council of the Royal Horticultural Society, recognising the inconvenience of the haphazard system, or rather of the total want of system, followed in too many cases in the naming of Orchids, appointed a committee to draw up a code of rules applicable to the special purpose, and which it was hoped might be applied to other plants as well. The committee was thoroughly representative, comprising Orchid importers, Orchid growers, botanists, and journalists. The first step was to procure suggestions. To this end communications were made to a large number of Orchid lovers in this country, and to several on the Continent. The suggestions thus obtained were collated and codified and formed the basis of discussion at some five or six meetings. The general result is now before us in the shape of a document adopted and issued officially by the Council. The suggestions and the code were extensively pruned in their passage through the Committee, so that the document may be looked at as a compromise effected to secure the least amount of disagreement.

One marked feature in the proceedings was the disinclination to employ any other than Latin designations, even for unimportant variations. Unlike the members of the Daffodil Committee, who are content to use the specific names for the larger and more sharply defined groups, and to adopt informal ones for

the variations, the orchidists contended for the use of Latin names for all cases except artificially raised crosses between varieties. There is thus a danger of perpetuating the present confusion between botanical names conferred according to a recognised system by authority, and duly recorded, and garden names applied haphazard without any of the guarantees against confusion that botanical names have. Possibly, if the directions in paragraphs 2 and 6 are acted up to, this danger may be diminished, but our experience does not lead us to hope much in this direction. Growers, and especially sellers, will, with some prominent exceptions, continue to name their plants, irrespective of the Orchid or any other Committee, even supposing those bodies act up to their duties. Were vernacular or informal names adopted for all plants not described, figured, and registered in the way customary among botanists, no confusion would occur; the botanists would have their names suitable for their purposes, the horticulturists—tied by no such limitations—would have theirs, and the two would not clash, but this view did not commend itself to the Committee.

The Council have adopted the following rules, as laid down by the Committee:—

SECT. I. GENERAL SPECIES, WELL-MARKED VARIETIES, AND NATURAL HYBRIDS.

1. The names of natural genera, species, and well-marked varieties, as well as of presumed wild hybrids, shall be written so as to accord with botanical language and usage, and to conform with the laws of botanical nomenclature (*Lois de la Nomenclature Botanique*) as adopted at the International Botanical Congress at Paris in 1867.

2. Exhibitors showing, for the first time, a plant under a Latin name, shall be required to furnish the name of the botanist who has described the plant.

SECT. II. ARTIFICIAL HYBRIDS BETWEEN GENERA.

3. Every bigener shall receive a generic name in Latin formed by combining the names of the parent genera, and a specific name also in Latin, the sign of hybridity \times being always added.

SECT. III. ARTIFICIAL HYBRIDS BETWEEN SPECIES.

4. Hybrids between species raised artificially shall be named in Latin, with the addition of the word *hybrida*, or of the sign of hybridity, \times . (See par. 1).

SECT. IV. ARTIFICIAL CROSSES BETWEEN VARIETIES.

5. Crosses between varieties raised artificially should receive suitable vernacular names.

SECT. V. GENERAL RECOMMENDATIONS.

6. The Orchid Committee shall decline to recognise any unauthorised name, or any name that is deemed unsuitable, or is not applied in conformity with the preceding rules.

7. A name once authoritatively adopted shall not be altered, unless in case of material error.

8. An award may be made to any plant that is considered by the committee worthy of such distinction, even though it be unnamed, or not named in accordance with the preceding regulations, provided that, within a reasonable time, to be determined by the Committee, a proper name be given. Any award made under the circumstances shall be suspended until the plant has been properly named.

9. The operation of these rules shall be prospective, not retrospective.

10. The Council wishes to impress upon Orchid growers the desirability of obtaining drawings or photographs of all new and certificated Orchids, and of depositing such drawings in the Library of the Society for reference.

11. The Council also desires to remind cultivators of the great importance of preserving specimens for future reference and comparison, and suggests that, wherever practicable, specimens should be sent for this purpose to the "Director of the Royal Gardens, Kew."

THE TEMPLE SHOW.—We understand that the entries are so numerous and so important, that a very fine show may be anticipated. If fine weather be granted, we trust the result will be such as to encourage the Council who, in face of great difficulties, have strenuously and successfully exerted themselves in reinstating the old Society. The show will be opened by H. R. H. the Prince of Wales on Wednesday next, and will be continued on the following day.

PROFESSOR OLIVER.—It is with much concern that we have to announce that Professor OLIVER resigns his post as keeper of the Herbarium of the Royal Gardens, Kew, at the end of this month. Professor OLIVER has been connected with the Herbarium for about thirty years, and it is quite impossible to overrate the services he has rendered to botany, and, incidentally, to horticulture, during that period. The Professor's modesty and retiring habits have prevented him from becoming so widely known to the general public as his merits warrant, but among botanists there is but one feeling of the highest respect for his perfectly unique knowledge, and of gratitude for the readiness with which he has always used it for the benefit of science and the public. We are glad to learn that the Professor will continue to reside at Kew, and to lend his invaluable assistance as Editor of the *Icones Plantarum* and in other ways.

LINNEAN SOCIETY.—At the anniversary meeting, held this day, Mr. CARRUTHERS resigns the Presidency of the Linnean Society. Mr. CARRUTHERS has been so excellent a President that it is impossible not to regret his retirement. Prof. STEWART, of the Royal College of Surgeons, is likely to be elected in his place.

LONDON PURPLE.—A correspondent in Kent who has damaged his Apple trees by using the above substance with water in the proportion of one to twenty, thereby following the instructions given him by the firm which supplied it gratuitously, is much to be pitied. The safer proportion would be one tablespoonful of London Purple to one gallon of water, for use on trees in leaf.

THE EFFECT OF FOG ON PLANTS.—We are pleased to be able to announce that the Government Grant Committee of the Royal Society, has allotted the sum of £100 to the Scientific Committee of the Royal Horticultural Society, for the prosecution of research as to the causes of the injurious effects of London fog on plants. We note this with the more pleasure, as this is the first instance in which the claims of scientific horticulture have been recognised in this manner, and a proof that the Royal Horticultural Society, in the opinion of the most competent and exacting judges, is doing good work in science.

MR. F. SANDER.—On the occasion of the QUEEN'S visit to Baron FERDINAND ROTHSCHILD, at Waddesdon, on Wednesday, the 14th inst., Mr. F. SANDER, the head of the firm of Orchid growers and importers at St. Albans, had the honour of being presented to Her MAJESTY. This should argue well for the adoption of Orchid growing as an ordinary

FIG. 108. — CASTILJA ELASTICA. (SEE P. 652.)

branch of horticulture. The St. Albans' establishment is not yet ten years old, but so rapid has been its progress under Mr. F. SANDER'S management, that it may fairly be classed amongst the largest of its kind in the world.

SIR JOHN PENDER'S DINNER TO MR. STANLEY.—SIR JOHN and Lady PENDER entertained a distinguished company at dinner at their home on Monday evening, the 10th inst., at 12, Arlington Street, in honour of Mr. H. M. STANLEY. The house

was beautifully decorated for the occasion by Messrs. WILLS & SEGAR, South Kensington, and NELL GWYNNE'S famous retreat looked like a veritable fairy palace. The courtyard and hall held a wealth of Azaleas, Lilies, Ferns, and Palms, the latter being very fine. A pleasing effect was gained by the use of parti-coloured lamps hidden away among the masses of foliage, while over all the electric light spread its mellow rays. The courtyard of the house was transformed into a tropical grove, Palms forming a green canopy over the approach to the mansion, whilst from the centre of the large tent mirrored baskets of novel design were hung with electric lights shining through them. The sides of the large tent were treated in a similar way, and the boundary walls brilliantly lighted with various-coloured lights. The mansion itself was superbly decorated with costly exotics.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversations* took place on Tuesday evening at the rooms, Hotel Windsor, Mr. JOHN LEE in the chair. There were present besides, Sir JOHN D. T. LLEWELLYN, the Rev. W. WILKS, Messrs. PEARSON, DREERY, SURELY HUBBERD, BESYARD, G. PAUL, &c. Mons. MAURICE DE YLMORIN was the guest of the evening. An interesting paper was read by Mr. SURELY HUBBERD on "Common Sense and Common Nonsense in the Naming of Plants." A very animated discussion followed, in which most of the members present joined. We understand that at the committee meeting held previously, it was determined to subscribe £50 to Baron SCHROEDER'S scheme for a hall of horticulture.

AN HISTORICAL PALM TREE.—Visitors to Rome in past years who remember the gardens of the British Embassy, will be interested, says the *Times*, to learn that the Palm which stood in them, and which was not only the tallest in Rome but was historical, as having been pierced by a cannon ball during the attack on the city in September, 1870, has been blown down during a gale. It was strapped with iron where the ball had pierced it, and was the only object in the vicinity which showed the traces of the attack which opened Rome to the Italian army.

THE GARDENERS' ORPHAN FÊTE.—All honour to the market men! Once again they provided for the public enjoyment, on Wednesday evening, what, in the words of an advertisement, may fairly be called "a vision of loveliness, balling description, and defying exaggeration." All the trouble, all the labour—and we had specially good means of estimating both—were expended in the noble purpose of contributing to the aid of the hapless orphans. A really magnificent show was got together of market plants and cut flowers, just as grown by the florists, or received by the salesmen in the ordinary way of business. The "cultivation," as usual, was so excellent as to make a gardener in a private place despair; but he has a hundred things to look to, while the grower for market confines his attention to ten or fewer subjects. After a hard day's work, the market was swept as well as garnished, ready for the reception of my Lord Mayor and the Lady Mayoress, who were received by Mr. BOYDSE, Mr. STEADLEB, Mr. ASHBE, Mr. BARON, and other members of the committee. The Lady Mayoress made a charming little speech, the Lord Mayor sympathised with the objects of the display, as satisfactory to eye and to the heart, and Miss L. V. BARON gracefully presented a bouquet to the Lady Mayoress. Sir JULIAN GOLDSMID, the President, acted as *vicereine*, the band of the Horse Guards discoursed sweet music, the public flocked in, and we trust and believe the orphans' treasury is substantially the better for this delightful means of raising the wind. The Council of the Royal Horticultural Society was represented by its President, Sir THEYER LAWRENCE, and by Mr. HEYWOOD; the Duchess of Devonshire was also present. The absence, from ill health, of the genial chairman of the evening

mittee, Mr. GEORGE DEAL, was much commented on, and the utmost sympathy expressed; and so the *file* went on till near upon midnight, and an hour or two later business was once more in full swing. Among the many ways of celebrating the anniversary of the QUEEN'S birth, could there be any better than this?

MANY-HEADED BROCCOLI.—We have again received from MESSRS. SUTTON & SONS, Reading, a specimen of Broccoli with seven heads, a central one of large size, and the others much smaller. It would appear that this type of Broccoli is on the way to become fixed. The senders remark that none of the variety had suffered from frost this past winter.

THE NURSERY AND SEED TRADE ASSOCIATION.—The annual dinner of this valuable Association of Nurserymen and Seedsmen, is announced to take place at the Guildhall Tavern, Gresham Street, E.C., on Wednesday, May 28, at 7 o'clock, p.m.

PARIS HORTICULTURAL EXHIBITION.—Mr. SANDER, of St. Albans, has been awarded the Gold Medal of the Minister of Agriculture for his exhibition of Orchids.

HORTICULTURAL ARCHAEOLOGY.—The *Pall Mall Gazette* takes some exception to Mr. ALAN TADEM'S Archaeology. It asks: "How comes it that a vigorous plant of *Clematis Jackmanni* adorns one of the Roman scenes in the New Gallery?" and it further enquires, "If this plant was introduced by Mr. JACKMAN within the last twenty-five years, how can it have appeared in Italy 1800 years ago?" Presuming the fact is correctly set forth, the horticultural knowledge of the great painter appears to have been at fault for once.

CERASUS PSEUDO-CERASUS.—In our notice of this fine tree we omitted to make mention of the plate and description given in M. LAVALLÉE'S *Arboretum Syriacum*, tab. xxxvi. LAVALLÉE cites the following synonyms: *Prunus paniculata*, *Bot. Rey.*, 800; *Cerasus Sieboldi* Carr., *Rev. Hort.*, 1866, p. 371, tab.; *C. Lannesiana* Carr., *Rev. Hort.*, 1872, 198; *C. serotifolia*, Lindl., *ex Carr.*, *Rev. Hort.*, 1877, p. 389; *c. tab. C. Japonica*, fl. roseo pleno, *Flora des Serres*, xxi, p. 141, t. 2278; *Cerasus Watereri*, Hort.; *C. Modia*, Hort., &c. It is a common Japanese tree, which has developed numerous varieties. It was first introduced by FORTUNE in 1861. *C. Lannesiana* is the single form as figured by us last week, p. 609.

PHALÆNOPSIS "CYNTHIA" ×.—Messrs. VERTON forward us from Lord ROXBURGH'S collection flowers of this beautiful hybrid between *Schilleriana* and *anabilis*. The flowers have the general form of those of the latter plant. The segments are flushed with pale lilac, the two lateral ones marked with purplish-brown spots, the upturned lobes of the lip are rather thick whitish, streaked with purplish streaks at the base, the central two-lobed callus yellow, with purplish spots, the anterior lobe white, flushed with yellow at the base, obovate-deltoid, the apex dividing into two linear curved thread-like processes, each almost as long as the anterior lobe itself.

BIBLIOGRAPHY OF AMERICAN ECONOMIC ENTOMOLOGY.—The United States Department of Agriculture has published a volume, containing a list of the more important contributions to economic entomology, made by B. D. WALSH and C. V. RILEY. To give some idea of the amount of work done, it may suffice to say that this record of titles, with brief indications of the subjects treated, occupies nearly 500 octavo pages, including a full index of species. The whole has been compiled by Mr. SAMUEL HENSHAW, and will be of immense service to those interested in insects, and the injuries they inflict on plants.

SOME ADJECTIVES.—Reporters of flower shows in this country show a paucity of resource in their selection of epithets. One exhibit is "fine," another is "grand," the next "fine" again, and so on. On the other side of the Channel, the reporters have a greater choice of language. We cite the following series from a recent report verbatim: *superbes, beaux, extraordinaires, très remarquables, délicieux, gracieux, merveilleux, magnifiques, intéressants, excellent, très distincts, toujours très admirés, jolis, très bels, charmantes, très jolis, nouveaux et splendide.*

STOCK-TAKING: APRIL.—The Trade Returns for the month were not issued until the 8th inst.—rather late in the month for such an important document. The figures are still unsatisfactory, the balance continuing on the wrong side. The difference on the four month's trade is also on the wrong side. The exports for the month and four months show a balance the proper way, so far as articles of home produce are concerned, but a heavy decrease in foreign and colonial produce. The "why" for this is not for us to seek out—possibly syndicates, corners, rings, strikes may have for a time paralysed the efforts of the great middlemen who help to make this country the world's mart. The whole matter is well worth the consideration of statesmen and chambers of commerce. "Corners," &c., are signs of commercial ill-health, requiring the immediate attention of the "doctor." The following is extracted from the monthly summary of the Returns:—

	1889.	1890.	Difference.
Total value of imports	£ 37,255,745	35,680,242	-1,575,503
II.—(A.) Articles of food and drink—duty free	11,817,368	10,791,814	-1,025,554
(B.)—do., dutiable	2,068,907	1,862,928	-205,979
VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	9,381,656	9,507,071	+125,415
VII.—Raw materials for smelting industries and manufactures (including wood and timber, hewn, sawn, split, dressed, vegetable materials, for paper-making, &c.)	2,887,633	3,063,320	+175,687
SIX.—Miscellaneous articles (including Cloves, Flax, Roper, Linsced)	1,008,114	945,163	-62,951
(B.)—Paper & Post	39,236	32,735	-6,501

The following figures more particularly concern home growers:—

§ II. Fruit.—	1889.	1890.	Difference
Apples, raw	272,258	40,069	-232,189
Unenumerated, raw	36,851	17,888	-18,963
Onions	2,55,929	297,619	+41,690
Potatoes	79,728	36,187	-43,541
Vegetables, raw, unenumerated	Value £15,918	£6,496	-£9,422

TIMBER IMPORTATION.—The length of time the timber takes to come to a paying maturity, the brief record of a month's import, may throw light upon. The figures are from the Trade Returns for last month, and are as follows:—Wood and timber, hewn, 191,893 loads, against 172,076 loads in April, 1889; sawn or split, planed or dressed, 205,292 loads in April, 1890, against 195,981 loads last April. Staves of all dimensions show an import for April of 10,922 loads, against, for April, 1889, 8,708 loads. Mahogany shows 60,85 tons, against 5845 tons in April, 1889.

LORCHIDEENE.—The nineteenth meeting was held in Brussels on the 11th inst., when a fine display of Cattleyas, Vandas, Odontoglossum, Cypripedium, &c., was made. Among the novelties was

a new variety of *Cattleya* dedicated to M. G. WAROCQVE, and a new *Dendrobium*, *D. Galliceanum*, flowering in dense clusters, like *D. thyrsiflorum*, but with the lip much larger and more spreading, of a pale yellow; the perianth segments are also larger, toothed, and pure white. Diplomas of honour of the first-class were awarded to *Cattleya Warocqueana*, *Dendrobium Galliceanum*, *Odontoglossum amabile*, and *Cypripedium Mitecanum*; whilst some forty other specimens were premiated in some way or other, so that the Society is not niggardly in its distribution of awards.

AGRICULTURAL AND HORTICULTURAL ASSOCIATION.—The National Co-operative Flower Show has again been arranged to be held at the Crystal Palace. The date fixed is Saturday, August 16. Last year the Show attained great dimensions, filling the great nave of the Crystal Palace from end to end. The number of exhibits were over 4000, and visitors exceeded 32,000. This year the Agricultural and Horticultural Association of London contributes nearly £200 in prizes, and the Crystal Palace Company £150. It is expected that Special Prizes will also be offered by numerous London and Provincial Co-operative Societies, as was done last year. The schedule just issued embraces offers of £25 money prizes, besides Silver and Bronze Medals, and—for the first time—a Champion Gold Medal. One new feature is the division of exhibitors into geographical districts. For the more important prizes the country is mapped out into five districts, so that exhibitors from the North will not have to compete against the South, the West, the Midlands, &c., or vice versa. The Secretary is Mr. EDWARD OWEN GREENING, of 3, Agar Street, Stuaod, London, W.C.

WILLOWS AND POPLARS.—For ornament, windbreaks, and timber, the Russian Willows and Poplars are receiving much attention in the Northwest. The best Russian Poplars appear to be *Populus Cermisensis*—of which P. Petrowski seems to be a synonym; *P. laurifolia*, *P. Sibirica pyramidalis*, *P. Wobskyi*, *P. betulifolia*, *P. balsamifera*, of Asia, and *P. Bollcana*. The last is considered particularly valuable for ornament. A number of good Russian Willows are characterized. These are *Salix acutifolia*, *S. fragilis*, *S. laurifolia*, *S. aurea*, *S. Napoleonis*, and *S. rosmarinifolia*. *Salix laurifolia* "without doubt, has the handsomest foliage of any Willow in cultivation." "Take cuttings from healthy, vigorous trees; cuttings from such trees root easiest. It is generally best to make cuttings in the fall, after the growth stops, and winter them over, buried in well-drained soil, or plant out at once. Cuttings of Willows and Poplars may also be successfully rooted if made early in the spring before growth starts. Select clean two-year-old wood, or strong, well-ripened one-year-old wood for cuttings. Make cuttings from 8 to 10 inches long, and as near to one half-inch in diameter as economical cutting will allow. Larger cuttings root nearly as well, but are more bulky to handle. See that the cuts are made smooth with a sharp knife. Have the land for cuttings thoroughly cultivated, and the ground mellow. Plant at least 8 inches deep, in rows 3 feet apart, and press the soil close around the base of the cuttings. Do not tramp them in hard if the ground is wet. If the land is dry they cannot be too firmly placed in the soil. Keep well ahead of the weeds by running a horse-cultivator between the rows very often." *Bulletin No. 9, Minnesota Experiment Station.*

APPLE SCALE.—The last Bulletin of the State Agricultural College of Michigan contains an interesting account of some experiments made to prevent and palliate the attacks of scale (a fungus named *Fusicladium dendriticum*), various substances were employed. Sulphur was least effectual, then Sodium hypophosphite, then Potassium sulphide with which 25 per cent. only were free from scab; then copper carbonate and ammonia, which protected over 50 per

cent.; while best of all was Eau celeste, by the use of which over 70 per cent. of uninfected fruits were secured. The copper solution is made by mixing 3 oz. of copper carbonate with one quart of liquid ammonia, and as soon as all action has ceased, diluting to 30 galls. Eau celeste (modified) is prepared by dissolving 2 lb. of copper sulphate (blue vitriol) in hot water in one vessel, and $2\frac{1}{2}$ lb. of carbonate of soda in another vessel. Mix, and before using add 1 pint of ammonia, and dilute to 22 galls. These solutions may be used with a spray pump; 25 to 50 per cent. will be added to the value of the crop at a cost of 25 to 30 cents per tree. In the experiments recorded, the trees were first of all sprayed with London Purple, 1 lb. to 200 galls. of water, at the end of May to kill the Coddin moth. Two days later, the fungicide experiments above narrated were commenced, and the applications were repeated on five separate occasions at intervals of a week or a fortnight.

GIRDLING TREES.—It is known that there is considerable difference in the effects of girdling on trees. These differences are explained by Dr. HARRIS as dependent upon the circumstance whether the conduction of water is through the sap wood only, or whether the heart-wood takes part in the process. In the latter case the effect of the pressure of the girdle would not be so much felt as were the soft-growing wood alone compressed, and no other channel open for the passage of fluids.

AMERICAN ASSOCIATION OF NURSERYMEN.—The annual meeting of this Association will be held in New York early in June.

THE ROYAL SOCIETY.—The Council have recommended for election into the Society, WALTER GARDNER, M.A. (Cantab), Clare College, Cambridge, F.R.S., Fellow of Clare College, Cambridge, University Lecturer in Botany, Rulleston Prize, 1888. Author of numerous papers containing original observations and discoveries in Vegetable Physiology, of which the following are the more important:—"The Development of the Water-glands in the Leaf of *Saxifraga crustata*" (Quart. Journ. Micros. Sci., 1881); "On the Continuity of Protoplasm through the Walls of Vegetable Cells" (Phil. Trans., 1883, and Sachs, Arbeit, d. Bot. Inst. in Wurzburg, B1. iii.); "On the General Occurrence of Tannin in the Vegetable Cell, and a possible View of its Physiological Significance" (Camb. Phil. Soc. Proc., 1883); "On the Changes in the Gland-cells of *Dionaea muscipula* during Secretion" (Royal Soc. Proc., 1883); "On the Phenomena accompanying Stimulation in the Gland-cells of *Dionaea dichotoma*" (*ibid.*, 1886); "On the power of Contractibility exhibited by the Protoplasm of certain Plant Cells" (*ibid.*, 1887); "On the Structure of the Mucilage Secreting Cells of *Blechnum occidentale* and *Onoclea regalis*" (Ann. of Bot., 1887).

MOUTAN PEONIES.—Of these showy plants Mr. R. DEAN remarks:—In the remarkable collection of varieties of Tree Peonies exhibited at the meeting of the Royal Horticultural Society on Tuesday 13 inst., appeared some fine blooms under the simple name of Moutan. Possibly these flowers were intended to intimate as near an approach to the original species as can be ascertained. On seeing these showy flowers, one can quite understand the applicability of Moutan—king of flowers, and no one can be surprised to learn it is the favourite garden flower of China and Japan. Some of the varieties shown by Messrs. KELWAY & SON, of Langport, who have taken a decided lead in developing the Tree Peony, were surpassingly fine, large, and very double, and of quite a regal beauty. Double varieties largely preponderate in a collection. They last longer, and are more imposing, though well formed single varieties have a peculiar beauty of their own. Who was not impressed with the singular chasteness of Beatrice Kelway, a new large-fringed single white variety, so well formed as to resemble a

huge shapely Tulip, and awarded a Certificate of Merit? A few of the most striking double varieties were Fascinatus, rose and white; Hero, pale lavender, with a purple base—very fine; Lumen, purple and blush; Edwardsii, rosy-peach, with violet base; Elizabeth, bright puce, very double; Louise Mouchet, salmon-pink, a charming shade of colour; Madame Stuart Low, reddish-salmon, very distinct, and extra fine; Madoire, salmon-rose; Ocelaire, soft rosy, passing to white; and Triomphe de Vandermael, bright rose, extra fine. A stock of any one variety is obtained by grafting on the roots of *P. edulis*, which is done in autumn, and by means of cuttings made of the flowering shoots. These are placed in sandy soil about the end of April and early in May, and root readily. In all their stages of growth they have a cold treatment. New varieties are obtained by seedling; the seeds are sown as soon as ripe in a cold frame, and they germinate in the summer and autumn following. They germinate slowly, and patience is required on the part of the raiser. When the plants are large enough they are transplanted to the open ground to flower, which they do about the second year. The Moutan Peony does well in a good garden soil; but it should be deeply trenched and enriched with manure, and the plants answer to liberal treatment. They flower in May and June, and unless occupying sheltered positions, the flower-buds are liable to be injured by early spring frosts.

AZALEA INDICA.—In looking at the Azaleas shown at the Crystal Palace on 10 inst., one could not but regret that our nurserymen and gardeners do not take a leaf out of the continental growers' book, and train their plants with short stems, and Mushroom or globular-shaped heads. The bulk of the flowers would then be seen to advantage above the other plants, flowering or foliage that might be placed beneath them. It might even be permissible to tip the Mushroom-topped head towards one side, the better to show off the flowers—an arrangement of no little moment when plants are employed in rooms, and often in a corner, or close to the wall of the same. Formal training is now carried to an extreme, and it would be a good feature at shows, if framers of schedules would award prizes for *exhibitions* specimens on short and long stems. The pyramid is about played out as a method of training, its worst feature being the great amount of flower at the base of the plant—a part that is least seen, and the most likely to be interfered with by neighbouring plants, to say nothing of the time spent in forcing a naturally handsome plant to take an unnatural form. Amongst the Azaleas *indica* shown at the Crystal Palace there were a few that were novel, viz., *Baronne de Vitre*, a beautiful pure white, with here and there a streak of crimson. *Modèl* is an excellent crimson-coloured variety. Both were shown by Mr. WATKIN'S gardener.

PRESENTATION.—On Monday evening, May 19, Mr. RICHARD CAMBS, who is leaving Bondjard House, near Jedburgh, after eleven years' successful service as gardener there, was presented by the Jedburgh Horticultural and Apiarian Societies, and a number of friends, with an address, a purse of gold, and a silver tea-pot, with inscription (for Mrs. CAMBS), as tokens of admiration of his high qualities as a friend, and abilities as a gardener. The presentation took place in the Royal Hotel, Jedburgh, and was attended by a company of thirty gentlemen.

LOSS OF THE MICHIGAN AGRICULTURAL COLLEGE.—The Botanical Laboratory of the Michigan Agricultural College burned on the night of March 21, the fire originating in the top story by a defective flue. This was the first building erected for the express and sole purpose of a botanical laboratory. It was built in 1880, at a cost of 6000 dol. It was one of the handsomest buildings among the many at this famous institution, and its equipment was large and invaluable. The lower

floor was devoted to a large class and microscope room, office, and herbarium cases. The second and third floors contained a very large and unique museum, especially rich in instructive features of the native flora and general agriculture. Very large collections of native woods, in novel shapes and arrangement, were particularly prominent. This department was more than the ordinary exhibit of woods, for it comprised manufactured articles, samples of lumber, and many things of direct economic value. The museum also contained one of the best collections of Indian-corn in existence. This museum had been a life work with Dr. BEAR, the Professor of Botany. It was partially saved, however, and all the microscopes and most of the collections upon the first floor were saved. One of the most lamentable features of the loss was the burning of the entire Wheeler Herbarium, an immense collection of Michigan plants. This herbarium represented twenty-five years of unremitting toil by Mr. C. F. WUELLER, of Hubbardstown, Michigan, the senior author of WHEELER and SMITH'S *Flora of Michigan*.

INDIA-RUBBER.

In these days, when local horticultural societies are formed in almost every provincial town, and when botanical and horticultural novelties attract so much attention from scientists on the one hand and cultivators on the other, the practical value of the combined efforts of both seem likely to be lost sight of. The interest attached to the successful growth, or to the flowering of a rare plant like the *Amorphyllum* at Kew last year, is equally divided between the scientific botanist and the practical horticulturist, but the introduction and successful cultivation of some valuable economic plant in countries very far distant from its native home, does not secure half so much popular attention, though the benefits accruing from it to the world at large are infinitely greater and of a more lasting character. What is the production of a double flower where a single one was known before only to exist, or even the introduction to our stores of such plants as the *Victoria regia* and the *Amorphyllum* titanium, or, if possible, the *Rafflesia* and *Welwitschia*, to the establishment in India of the *Cinchona* plants which has been the means of bringing that most important medicine, quinine, within the reach of all.

The result of this successful enterprise will always stand as a monument of the union of science with practice, and one of the benefits to the world in which Kew has played so large a part.

Next to this achievement, the introduction of rubber-producing plants into the various possessions of the British Empire is undoubtedly of the greatest importance. Though the whole history of these experiments has been given in the Reports of the Royal Gardens, Kew, ranging between the years 1875 and 1882, it may be of some interest to point out that whereas some twenty years ago indiarubber, or caoutchouc, was known to be produced only from *Hevea brasiliensis*, then known as *Siphonia elastica*, from Para, and from *Ficus elastica*, from Assam, the researches of the authorities at Kew have since shown that the rubber of commerce is drawn from several different plants, belonging to the natural orders Euphorbiaceae, Urticaceae, and Apocynaceae. The first-named family, including the Para sort, or *Hevea* rubber, which is still imported in large quantities, and holds its own as the best quality, though in its native forests the trees are said to be more and more difficult to get at, as the collectors have to penetrate further each year into the more inaccessible parts. The natural consequence of this is, that more attention has been given to other sources, and another Euphorbiacean plant, the growth of which has become considerably developed of late, and which yields the rubber known in commerce as Ceara scrap (*Manihot Glaziovii*), has been introduced into Ceylon and other countries, where it has grown rapidly. This, as its name implies, is a Brazilian species, and though the rubber has been known in

trade for a long time, the plant yielding it was not known till about fourteen years ago, when a consignment of plants was received at Kew, propagated, and widely distributed to India and Ceylon. The success of the plants in these countries has been recorded and fully detailed in the Kew reports before referred to; as also that of another well-known source, namely, the *Castilloa elastica* (fig. 108), which furnishes the bulk of the rubber from Central America, such as that known in trade as Guatemalo rubber.

Mr. Morris, in his little book on *The Colony of British Honduras*, gives some interesting notes on this tree, and details as to the cultivation and the extraction and preparation of rubber from it. He says:—"The tree is very abundant in some places, although daily becoming scarcer in the immediate neighbourhood of settlements. It grows to the height of about 40 or 50 feet, has a thick clean stem about 2 feet in diameter at the base, and in habit of growth much resembles a Bread-fruit Tree, to which, indeed, it is closely allied. . . . The *Castilloa* Rubber-tree is fit to be tapped for caoutchouc, or the elastic gummy substance produced by its milk, when about seven to ten years old. The milk is obtained at present from trees growing wild by men called rubber gatherers, who are well acquainted with all the localities inhabited by the Toonú (under which name the plant is known in Honduras). The proper season for tapping the trees is after the autumn rains, which occur some months after the trees have ripened their fruit, and before they put forth buds for the next season. The flow of milk is most copious during the months of October, November, December, and January. The rubber gatherers commence operations on an untapped tree by reaching with a ladder or by means of ladders, or ladders, the upper portions of its trunk, and scoring the bark the whole length with deep cuts which extend all round. The cuts are sometimes made so as to form a series of spirals all round the tree; at other times they are shaped simply like the letter V, with a small piece of hoop-iron, the blade of a cutlass, or the leaf of a Palm placed in the lower angle to form a spout to lead the milk into a receptacle below. A number of trees are treated in this manner, and left to bleed for several hours. At the close of the day the rubber gatherer collects all the milk, washes it by means of water, and leaves it standing till the next morning. He now procures a quantity of the stem of the moon plant (*Alonycyon speciosum*), pounds it into a mass, and throws it into a bucket of water. After this decoction has been strained, it is added to the rubber milk in the proportion of one pint to a gallon, or until after brisk stirring, the whole of the milk is coagulated. The masses of rubber floating on the surface are now strained from the liquid, kneaded into cakes, and placed under heavy weights, so get rid of all watery particles. When perfectly drained and dry, the rubber cakes are fit for the market, and exported generally in casks."

"A large tree of *Castilloa*, say 2 feet in diameter, will yield 8 gallons of milk when first cut; each gallon of milk, in the proper season, will make about 2 lb. of rubber. Hence, a tree of this size will give a return of 16 lb. of rubber, of the value of 10 dols."

Mr. Morris further refers to the use of the *Castilloa* as a shade-giving tree in connection with the cultivation of Bananas, Cacao, Liberian Coffee, Oranges, &c., and records the fact that at the time he wrote in 1883, the Cacao planters in Trinidad were gradually discarding their recognised shade-tree, the *Erythrina umbrosa*, and adopting others more suitable and more profitable, none of which, however, could compare with the *Castilloa*, "either in quickness of growth, in shade-giving properties, or in the return which it is likely to give the planter year after year, if properly treated." Our engraving on p. 649, taken from a photograph kindly sent us by Mr. Hart, represents a *Castilloa* tree growing in Trinidad.

It will be sufficient to say that the plants already referred to are the principal sources of the American

rubbers of commerce. Quantities, however, come from India, and from other parts of the East, the former from *Ficus elastica*, and the latter from various plants belonging to the Apocynaceae, being species of *Willoughbeia*, *Leuconotis*, and *Chilo-carpus*; while on the East and West Coasts of Africa, several species of *Landolphia* yield rubber of excellent quality. A detailed account of these species, and of their distribution into various parts of the world, is given in the Kew Reports before alluded to, and it forms one of the most valuable and interesting records of work done at Kew. J. R. J.

USEFUL INVENTION.

Is Oetzmann's patent flower boxes (fig. 109), we have an arrangement which is likely to prove of use to many who desire to decorate their windows by plants in boxes. The article in question consists of a number of pots (made in various colours) with junctions, by the aid of which any number of pots may be joined into one piece; and, moreover, the existence of the joints allows the box so made to be bent round to any window, bay or circular. Thus, no measuring or fixing is necessary, and any pot or joint which may be broken can be replaced at a

FIG. 109.—FLOWER BOX.

small cost. The patentees and vendors are Messrs. Oetzmann & Co., Hampstead Road, London.

HOME CORRESPONDENCE.

MAGNOLIA STELLATA.—It should have been stated that I procured the specimen figured in the last issue of the *Gardener's Chronicle* from Mr. J. W. Odell, gardener to Mrs. Brightwell, The Grove, Stanmore. It was taken from a specimen nearly 4 feet across, grown as a pot plant, and protected for early spring flowering. It bore hundreds of flowers and buds, and its beauty may easily be imagined. *Jones O'Brien.*

WHAT HAS COME TO THE COLUMBIANS?—A well-ordered Columbine inclines its head, and its sepals are as purple as the spurred petals themselves. Now, some of my Columbians this year, for no reason that I can discover, have chosen to produce green sepals and erect flowers. "Reversion to a primitive state of things." Perhaps; but why revert just now, when its neighbours in the same bed show no such tendency? and why revert this season, when they have been orderly inhabitants of the same bed for these twenty years? *Jack Towns.*

BROCCOLI VEITCH'S MODEL.—This variety of Broccoli may be considered one of the best of the late ones, and is, moreover, very distinct. If seeds be sown at different dates, the supply may be got to last till Cauliflowers come in. I was pleased to see that this variety of Broccoli was certificated at the meeting of the Royal Horticultural Society on 18th inst., when it was shown in good condition by Mr. Leach. It has a pure white close curd, and is not at all coarse or strong in flavour. The plant is short-legged, hardy, the leaves folding closely over the head. It has been grown for some years, and I am surprised that it has not received a Certificate award. Where five varieties of Broccoli are grown, seeds may be sown from the end of February to the

end of April. The seeds of Broccoli may be sown thinly broadcast, or in drills, or a little thicker, and pricking out the seedlings before crowding has taken place in the bed. Hence the plants cover as a protection during winter is not necessary, if no drawing in crowded beds has been permitted, as the leaves will be close to the ground, and the stems short and well matured. Model has so far not succumbed in the worst of our winters, but only lost a few of its outer leaves. *G. Wyllies, Syon House, Brentford.*

THE CUCKOO.—A writer in *Lund and Water* states that he saw the cuckoo in Dumfriesshire as early as April 3; but its special note was not heard until the end of the month, and states it is a matter of thought with him what the bird was doing in the interval. He hazards the opinion, although he may thereby display an ignorance of ornithological knowledge, that the special cuckoo cry with which all are so familiar with, "may be a note of achieved or expected success in laying its egg in some other bird's nest; somewhat of the nature of the cackle of a hen when she has laid an egg." He thinks something is necessary to explain the apparent discrepancy between the arrival of the bird—after which fine weather prevailed—and the delay in making its arrival known to the world at large; and then puts forward the theory given above. What do naturalists say? *R. D.*

PEACHES AND NECTARINES ON OPEN WALLS AT KENWARD.—The shoots sent herewith fairly represent our set of outdoor Peaches and Nectarines. The trees have borne well for the past twelve years, not one single failure in any of them at that time. They have no protection in spring other than that afforded by an 11-inch coping board. This board is taken down at the end of the month of May or in June, according to the weather. I find that this spring our wall trees are more subject to curl and blister than usual, but by strict attention we have got them pretty clean again by removing the blistered leaves and applying Tobacco-powder nearly every day. It is perseverance during spring that is required to master the Peach tree cultivation; for if neglected, then the cultivator has to wait for the midsummer shoots, which never get sufficiently ripe on open walls to depend upon for the following year. *Robert Smith, Yalling, Kent.* [The branches sent were thickly studded with young fruits, &c.]

GROWING DAFFODILS FROM SEED.—Hitherto the raising of Daffodils from seed have been chiefly confined to a few enthusiasts, to whose untiring efforts we are to-day indebted for so many of our choicest varieties. But the time is not far distant when they will be grown as freely as many other things. I would advise all who love this beautiful king of spring flowers to commence at once. It is true that four or five years of patient waiting will be required ere the result will be manifest, and if a sowing is made every year, a succession of new blooms yearly will follow, and the interest will be intensified by the possibility of adding something new to the already long list of Daffodils. The method of growing from seed is very simple: the seed is best sown as soon as it is ripe; the soil should be light and porous. On no account should manure be added to it, as it would be certain death to the young seedlings. The seed should be allowed to remain in the boxes or pans for two years, and then planted in a nursery bed. They do not require heat at any time, but may be grown in any cool-house. I have a batch of *Corbularia conspicua* now in bloom from seed sown by myself. This is the fifth season since they were sown; but I believe that, with good treatment, they would bloom in four years. I have several other batches of seedlings coming on. *J. C. Tonkins, St. Mary's, Isles of Scilly.*

ADVICE GRATIS.—It is curious why bulb-growing is not taken up more in Lincolnshire. There is much sandy soil behind the sea-banks that, if well-manured with cow-dung, would grow as good bulbs as the soil of Holland does. At least there seems no valid reason why this should not be so. If protection from the wind is needed, Reed-screens might be used with success as they are in the Scilly Isles, where the wind is more violent. Some fields near the Lighthouse, at Donna Nook, seemed to me particularly suited for bulb culture. Encouragement to try is given by the marvellous way in which Snowdrops and other bulbs increase in the cottage and farmhouse flower gardens. There is a good opening just now for producing bulbs of the first quality

Jaffodil, such as Exquisite, Grandee, Mrs. Camm, Glory of Leyden, Madame de Graaf, Katherine Spurrell, and Duchess of Westminster. Although the initial expenses of growing such sorts would be great, nevertheless, there is sure to be a constant demand

beer for home consumption. His materials, so far as I can remember, were water, sugar, and ground-ginger. These were placed into a large jar, and the fungus put in with them. In, I think, about a week, the fungus, which is of a yeasty nature, and of the

is popularly known as the Vinegar Plant. That is, I believe, naturally produced by placing water and sugar in a jar, and standing in a warm place, where acetous fermentation will be promoted, and the fungus called the Vinegar Plant produced. The product is, however, but a poor substitute for vinegar. Possibly some one may be able to obtain for Professor Marshall Ward a piece of the fungus; and although it has been, on high authority, said to be nothing but German yeast, yet I incline to the opinion that it is but the Vinegar Plant, a thing as old as the hills, but for some enterprising mind applied to the manufacture of ginger-beer. In any case, the Professor can soon put the German yeast theory to a practical test. *J. Dean.*

TOMATO HORSFORD'S PRELUDE.—Now that there is a great number of varieties to choose from, suitable for indoor and outdoor cultivation, no difficulty need be experienced in getting the best for the purpose. All varieties do not set their fruit freely in the early spring-time, but I saw some plants of the above-named kind at Syon, Brentford, that were growing and fruiting admirably. Planted alternately with Tomato Perfection in a low warm house, they occupied the back wall, the front being occupied by Melons. Horsford's Prelude had fruit the size of Walnuts from the base of the stem for some height, whilst Perfection had scarcely a fruit set. Mr. Wythes spoke highly of the variety. *E. M.*

VITALITY OF SEEDS.—I wish to place on record one instance more, illustrating this point. Twelve months ago I sowed a seed of *Abrus precatorius*, or the Liquorice tree. This was one of several others of the same kind which I know to be twenty-five years of age. I have had the seeds since the beginning of 1879 and the gentleman who gave them to me grew them in the West Indies, and he left there in 1855. The seed sown, as mentioned above, has vegetated this spring, and is growing vigorously. *G. Paul, Knaresborough.*

STRAWBERRIES.—Auguste Nicaise is a variety which is spoken well of by many gardeners, and I should be glad if some kind friend would send me a few plants from which I may get a stock, as I should like to try it as a forcer. Vicomtesse H. de Thury generally serves us well, but to have the best results the plants must be strong. British Queen is our best variety for late work, and it is still without a rival for flavour, size of berry, and as a traveller. Keens' Seedling is a wonderful cropper, but it is soft, which does not matter much for consumption at home; and the flavour is good. We have tried Sir Charles Napier and President, but when once the British Queen comes into use, no other variety is eaten. *J. Sheppard.*

STRAWBERRY NOBLE IN IRELAND.—I quite agree with those who say that Noble is deficient in flavour, and but for this, I consider it a most useful variety for pot culture. I have been sending to table for some time dishes of Noble, fine in colour and of good size, some fruits weighing 1½ oz., others 1 oz., and some less. It is a good bearer in 6-inch pots, having from twelve to eighteen fruits fit for table on a plant, nevertheless I do not intend to force it another season. I have British Queen coming on, which never disappoints one in flavour or size, and I shall be happy to send you a few fruits for your opinion. [By all means, do so. Ed.] *W. Cairns, St. John Gardens, co. Meath, May 15.*

PANSIES AT THE DRILL HALL.—There was singular pleasure and charm found in turning out of the noisy street into the James Street Drill Hall to find such a beautiful show of Pansies and Violas within the 15th inst. Beautiful Orchids and giant Peonies may have their several admirers, but Pansies are the favourites of the million. It may, indeed, be doubted whether there are any more popular hardy flowers grown, or more of any kind of flower, for Pansies are turned out annually by the million, and are found on the coster's barrow at 6d. per dozen, or in the nursery at 10s. per hundred. Perhaps the most popular are the massing Pansies, those, be they white, yellow, blue, or purple, indeed of any striking self colour, which in beds or borders produce in the spring and early summer such delightful effects. But the wondrously coloured fancy or Belgian varieties, if less suited for massing, are yet in great request; indeed, these have practically been instrumental in bringing Pansies as show flowers once more into popular favour. The older strain of

FIG. 110.—DOUBLE CRIMSON RIDES: HARDY FLOWERING SHRUB. (SEE P. 644.)

at a remunerative price for such beautiful and graceful flowers. *Vagabond.*

THE GINGER-BEER PLANT (SO CALLED).—My attention was first called to this fungus a few years since by an old man, who said that, through its help, he was enabled to make a plentiful supply of ginger-

character of German yeast, produced acetous fermentation, and the sugar being converted into a mild acid, the liquid was ready for use. It cannot be said that it was altogether a pleasing drink, indeed, a long way less acceptable than pure water, or lemonade made from syrup. I do not understand that this fungus differs in any way from that which

English show Pansies, belted and self, medium in size, and, except in colour of ground, almost as like as two Peas, had pulled somewhat upon the public taste. They were not only indifferent growers, but they tended to deterioration. The bold and brilliant fancies being of stout constitution and free blooming habit, with very large flowers took hold on popular favour. Messrs. Hooper & Co., of Bath, famous western Pansy growers, had no fewer than 200 flowers set up in boxes, and on paper discs—not the most artistic methods of showing them, certainly, but still enabling the spectator to note the merits of each individual flower, and they were presented as examples of the firm's fine strains. Here were white, yellow, orange, claret, maroon, cream, red, violet, and divers other ground tints, all the flowers having the large dense blotch without which no flower is ranked as a fancy. From Manchester came a beautiful collection of fancies, set up as young plants in moss, and charmingly disposed, with a background of *Primula Sieboldii* varieties, by Messrs. Ryder & Sons, of Sale, whose enterprise in bringing plants so far to help decorate the two luxurious Drill Hall cannot be too highly praised, and who reflects something upon florists nearer home, who select little or nothing of their flowers. All the varieties set up by this firm were named, and in propagated plants. Of these, best, perhaps, though all were beautiful, were Niel McHay, Champion, Princess Beatrice, Prince Silverwing, William Dean, Mrs. W. P. France, Prizetaker, E. W. Dollish, E. Bruce, A. Ashcroft, Agnes Mitchell, Captain Thompson, and J. Fleming. Here is a baker's dozen of beauties, and as seen in their mossy beds, literally all a-growing and a-blowing, it is not a matter for surprise that they found many ardent admirers. A. D.

HARDY FLOWERING SHRUBS.—Mr. Goldring's dictum that no advance has been made in the cultivation of these since the days of London, rings very true. Leaving out the shrubberies of Devonshire and Cornwall, there is a great uniformity in the trees and shrubs grown, and very little originality in the grouping, for too many gardeners are content to excel, or to be successful, in their houses and flower and kitchen gardens. The flowering shrubs and trees you figure in your last issue ought, one and all, to be planted in our shrubberies, and to these might be added the old Yellow Wood (*Cladrastis tinctoria*), which bears showy white paniced blossoms, *Cercis siliquastrum* (the Judas Tree), and the Bladder Senna (*Colutea*), which carries on into the summer a like effect to the Laburnum. A beautiful flowering shrub, *Escallonia macrantha rubra*, is far harder than is generally supposed, and many others could be mentioned with which it would be interesting to experiment in sheltered places. Information could be best obtained as to hardiness from nurserymen, for they, as you truly say, have not neglected so much this branch of horticulture, and visitors to nurseries very often betray surprise at seeing shrubs, of whose beauty and elegance they had no previous idea. What can be done in Cornwall is best realised by seeing such shrubberies as those Mr. Bashleigh has planted near Fowey, or by visiting Tregothnan, Lord Falmouth's, when the *Camellias* and *Rhododendrons* (including some of the Sikkim varieties) are in flower in the open air. A pilgrimage to this latter *paradise in sole* is worth the while, if only to see the silvery *Ful*, its leafy banks among. C. A. M. *Cornwallist*.

CATERPILLARS IN FRUIT HOUSES.—In our fruit house we have been troubled for the last three years with very active caterpillars of a minute size, coupled to a voracious appetite for fruit and leaves. Their activity is so great that when more than three lines long, immediately on your touching the curled-up or glued together leaves, they dart along a web and very often escape being killed. Thinning out of the shoots and constant hand-picking, together with occasional dusting of the surface with fresh slacked lime and very dry soot has been steadily followed up daily since the leaves formed, but no sooner have we destroyed all the live ones, and sooted, limed, and cleaned up the house, than fresh ones appear. Where from? we ask; do they fly in the air? The ground is not rich, no manure, mulching, or rank material having been introduced into it for three years, and the only liquid manure afforded the trees is guano water. They are not to be found in any of the vicinities, Melon house, or any where except in this fruit house and on a distant Par wall in the garden. In this fruit house are Peas, Peaches, Apricots, Plums and Cherries. Cherries suffer most.

What is the remedy? How do you account for it? *Caterpillar*. [Please send specimens carefully packed. Ed.]

BRUAUNT'S NEW ZONAL PELARGONIUMS.—In the *Gardeners' Chronicle* last autumn, I referred to a large collection of these new French varieties at Messrs. Pope & Son's nurseries, King's Norton, Birmingham, naming some of the most striking then in flower, and mentioning that many of the new varieties would not be in flower until the spring. I visited the nurseries recently in order to see if any of these new Continental kinds would turn out to be acquisitions. The type of almost all of Bruant's raising is to be found in *Gloire Lyonnaise*, strong growers, large foliage, and very large trusses, with large ill-shaped flowers, but some of them fine decorative varieties, and useful for market work. In doubles, Le Bruant stands prominently out as a grand market variety, and Messrs. Pope & Sons think so highly of it that this variety is grown extensively, and hundreds of flowering plants have been sold all through the winter. Amongst other varieties of Bruant's, two are really fine doubles, and of very pleasing shades of colour. One is Dr. Thouvenel, bright salmon-pink, and large truss, which retains its centre pips. The other is *Beauté Poitevin*, light salmon-pink, with cerise centre. Both of these are good. Amongst the numerous new single varieties from France, the best are Alfred Mane, pale salmon-scarlet, and immense flower and very large truss, habits of *Gloire Lyonnaise*, but not so coarse in the foliage, and which promises to be a good market variety; Madame Poincignen, pale lilac-pink tinted with salmon; Barbiget, bright soft pale-pink with light centre and fine compact truss; Del Rossa, veined light salmon-pink with white eye, very fine truss; and Mille. *Eulilie Barre*, bright scarlet, very large truss. All these varieties are evidently good market sorts. For quality, that is perfection in form and substance, our grand English-raised varieties are a long way ahead; and so very fine are many of these varieties, that it seems almost impossible to beat the newer ones, and yet we still get new shades of colours and exquisite form. For indoor decorative work no plant is of greater value for winter and spring-flowering than the zonal Geraniums when well done, and King's Norton is one of the homes of the zonal Geranium, especially for winter-blooming. W. D.

HOME-GROWN LILY OF THE VALLEY.—I send you a few Lilies of the Valley from out-of-doors, gathered from my fields this morning, and should like to know what you think of them. I think you will agree with me that they are equal if not superior to any that are imported, and not far short, in quality, of the much-talked-of *Convallaria majalis grandiflora* var. *Fortii*, T. *Jannoch*. [We have never seen finer spikes or larger bells. Ed.]

LARGE FLOWERING PELARGONIUMS.—When looking over the collections of large-flowered Pelargoniums shown at the Crystal Palace on the 10th inst., one could but notice how large a part of what are known as the decorative, spotted, and semi-double varieties were to be seen. Doubtless this is owing to the freedom with which they flower, and the large and bold trusses of bloom they produce; but then the trusses have quite a confused and even rough appearance. Now, I possess so much of the old horticultural liking for outline and smoothness of pip in the large-flowered Pelargoniums, that, in my opinion, it is regrettable that they are less grown for exhibition purposes than formerly. Perhaps we see more of the decorative varieties at May exhibitions because they are quicker to get into bloom—a fact to which growers bear testimony. That they yield striking masses of bloom there can be no doubt, but I like the refinement of the smoother and more finely formed flowers of the show varieties, so called, and it is for this reason I regret they are not more grown for exhibition specimens. There was a time when a charge of sparseness of habit could have been brought against some of the show Pelargoniums. That no longer can be pressed against them; of late years the newer varieties have shown considerable robustness of character and freedom of habit, as well as of bloom; pips are large and well-formed, bold, and striking, and in all respects they are well adapted for the exhibition stage; in fact, the advance in the new varieties raised by Mr. E. B. Foster and others has been so marked that some have said there is little room or capacity for further improvement. This is far from correct. Raisers of

seedlings always find their ideals advancing, and if they raise a flower that shows a marked advance upon any contemporary variety, they instantly and naturally conceive of something better to be obtained. Progress in floriculture is illimitable; the possibilities of Nature are illimitable; and the *ultima thule* is not yet reached. The following list represents a dozen fine and varied show Pelargoniums: Ambassador (Foster), Amethyst (Brebant), the best purple variety, and remarkably free; Crusader (Turner), Despot (Foster), rich deep crimson; Fortitude (Foster), Illuminator (Foster), bright vermilion-scarlet; Maid of Honour (Foster), Martial (Brebant), *Maizette* (Foster), Prince Leopold (Foster), very bright; Ritzalst (Foster), and Virgin Queen (Smith), white. Twelve fine, distinct, and very free decorative varieties will be found in Decorator (Hayes), Duchess of Edinburgh, Edward Perkins, of a bright hue of crimson scarlet; Fairy Queen (Hayes), pale pink, very pretty; Lady Isabel (Hayes), bright deep lilac, which makes a charming specimen; Maggie (Turner), white, with distinct dark purple spots, a new and very pleasing variety; Mrs. Potten, Rosetta, rosy-purple, very distinct; Spotted Beauty (Turner), soft rose, with rosy-crimson spots; Triumph de St. Manle, old, but very free, and bearing very fine trusses of deep crimson flowers; and Triumphans, rich purplish-crimson. Not less valuable are the foregoing for the decoration of the greenhouse and conservatory. As a general rule, large-flowering Pelargoniums are scarcely so well treated as they deserve to be; they are frequently grown with mixed collections of plants, inconveniently crowded, drawn, and not so closely attended to in the matter of cleanliness as they deserve to be. There is scarcely another plant that answers so generously to proper attention as does the large-flowered Pelargonium. R. D.

MONTBRETIA POTTSII.—My experience of this plant for the last seven years is, that it should be left alone when once it is established in good soil and a suitable position, and then it will, I think, not fail to flower freely annually—our clumps do so. Once only have they been removed, and that was when an alteration was made in the border; and then the roots were not very much disturbed, the clumps being lifted with the soil attached and replanted just as they were. We have also growing in the same border—a southern one—roots of *M. crocosmiflora*, which throw up strong spikes of flower that last a long time in good condition. Both varieties are capital border plants. E. M.

CATERPILLARS OF THE LACKEY MOTH.—As this is the month when these troublesome pests attack the Apple, Oak, Elm, and Birch, I think it right to state that one of the most effective means to destroy them, as soon as they are hatched from the ring of eggs which the moth fastens round the smaller branches, is carbolic acid at the rate of one quarter pint to 2 gal. of water. I have employed some workmen who, furnished with a piece of rag tied to a long pole, touched the small bunches of the caterpillars enclosed in a fine web which they spin around them as soon as hatched out. The least drop of the mixture is instant death to the caterpillars at this stage. J. F.

SOCIETIES.

ROYAL HORTICULTURAL.

At the meeting of the Fruit and Floral Committees, held on May 13, and referred to in detail in our last issue, awards were made as follows:—

By the FLORAL COMMITTEE.

First-class Certificates.

To *Cytisus scoparius* Andreanus, from Sir Trevor Lawrence, Messrs. J. Veitch & Sons, and Messrs. Paul & Son.

To *Cydonia japonica* Moerloose, from Messrs. J. Veitch & Sons.

To *Acer Prince Henjery*, from Messrs. Paul & Son.

To *Blanfordia nobilis imperialis*, from Messrs. F. Sander & Co.

To *Syringa Madame Kreuter*, from Messrs. Paul & Son.

Awards of Merit.

- To *Juniperus canadensis aurea*, from Messrs. Paul & Son, and Messrs. J. Veitch & Sons.
- To *Lunaria biennis variegata*, from Messrs. W. Cutbush & Son.
- To *Pansy Eynsford Yellow*, from Messrs. H. Cannell & Sons.
- To *Primula alba magnifica*, from Messrs. Ryder & Son.
- To *Enkianthus campanulatus*, from Messrs. J. Veitch & Sons.
- To *Pansy (Tree) Beatrice Kelway*, from Messrs. Kelway & Son.

BY THE ORCHID COMMITTEE.

First-class Certificate.

- To *Odontoglossum maculatum anceps*, from Mr. Atkinson.

Award of Merit.

- To *Cyclogyne tomentosa*, from Mr. R. J. Measures.

BY THE FRUIT COMMITTEE.

First-class Certificate.

- To *Broccoli Veitch's Model*, from Mr. W. C. Leach.

Mals.

- Silver Banksian, to Messrs. Paul & Son, for a group of plants, &c.
- Bronze Banksian, to Messrs. Ryder & Son, for a group of *Primula Sieboldi* and *Pansies*.
- Bronze Banksian, to Mr. J. Forbes, for a collection of *Pansies*.
- Bronze Banksian, to Messrs. Barr & Son, for a collection of cut flowers.
- Bronze Banksian, to Messrs. J. Veitch & Son, for a group of plants.
- Bronze Banksian, to Mr. F. Hooper, for a collection of *Pansies* and *Pinks*.

Scientific Committee.

TUESDAY, May 13. — Present: Mr. Morris in the chair; Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Dr. Scott, Mr. Wilson, Dr. Muller, and Rev. G. Henslow, Hon. Secretary.

Plant Bug. Mr. McLachlan exhibited specimens of a small green bug, which has become very troublesome in the temperate-house at Kew. It attacks *Fuchsias*, *Rhododendrons*, *Camellias*, &c. It has been observed for the last ten years. Paris green or London purple (arsenical preparations) were suggested as the best remedies, fumigating being difficult in so large a place.

Ceratitis citrifolia (McLeay, 1829).—Mr. Henslow gave some account of the Orange-fly, which has become very troublesome in Malta. He also exhibited specimens of the grubs, pupæ, and insects. It first appeared about fifteen years ago, but has increased to a very injurious extent during the last three years. A committee was appointed in 1884, by H.E., the late Governor of Malta, who have just issued their report (which will be published shortly in the *Kew Bulletin*). The fly perforates the half-ripe Orange, and lays several eggs within it. This causes the fruit to fall prematurely. The larva finally escapes, and enters the ground to pass into the pupa stage. It is suggested that preventive measures should be taken at this period, first by collecting all fruits attacked, and mashing them up with water in a tank. Secondly, the surface of the ground should be sprinkled with a mixture of one part of sulphate of iron, finely powdered, to twenty-four parts of dry earth or sand, and subsequently slightly watered. An account of this insect (under the name of *Ceratitis capitata*) will be found in the *Gardeners Chronicle* of 1848, p. 601, at which period it caused great damage to Oranges received from St. Michaels (see fig. 111). In Malta it particularly attacks the Mandarin (*Citrus nobilis*). Cold and inclement weather is very unfavourable to the fly, which becomes much more abundant in a hot dry season.

Prinosus Cornubiensis varians.—Mr. Henslow showed specimens of Pear roots bored by this longicorn; also the grubs and beetles from Malta, where it is causing great damage to many fruit trees. The only remedy suggested was the well-known one of spurring. In Malta, however, the beetles attack the roots rather than the stems, so that the difficulty of reaching them was greatly increased, as the only sign of their presence may be a feebleness in the upper part of the tree, and the branches decaying, when the tree may be already past recovery. The greatest difficulty, however, is to overcome the apathy of the cultivators themselves.

Delphinium disease.—Some leaves were sent by Mr. Haywood, of Reigate, apparently attacked by a fungus. They were forwarded to Professor M. Ward for examination and report.

Primula metamorphosid.—Mr. A. Dean sent a number of seedlings of the "Jack in the Green" form of *Primula*. In this variety the calyx is foliaceous. Of the seedlings some had assumed the "hose-in-hose" type, the calyx becoming petaloid; in others the calyx had become polypetalous, the sepals varying from the foliaceous to a setiform condition.

Primrose and Bluebells degenerated.—Mr. Henslow showed specimens grown in his garden. They were received some years ago from Wiltshire, but have degenerated on the gravelly soil of Ealing. The Bluebells become pink, then white, at the same time changing in form from the normal cylindrical to a cup-shaped perianth. This latter form is recognised as a permanent one—viz., var. *campanulata*, of which there is a bed at Kew. Transitional stages are not uncommon. The Primroses exhibited were taken from a number of separate plants of the long-styled form; but they had nearly all assumed a homomorphic character, by the pistil being dwarfed in length, and so bringing the stigma down to the level of the anthers.

Plants exhibited.—Mr. R. I. Lynch sent an interesting series from the Botanic Gardens, Cambridge. *Neviusia alabamensis*, A. Gray, a curious apetalous ally of *Rhodotypos*. It has foliaceous sepals, and three or four carpels only. *Baccharis patagonica*, a shrubby composite, with flowers not unlike that of *Grondsel*; the florets, however, are female only, with a rudimentary corolla tightly fitting the style, and having no border. *Triostemum pinnatifidum*, Maxim; *Aristolochia ringens*, Vahl; *Vanda alpina*,

To *Myosotis rupicola*, from Messrs. Paul & Son.

To *Trollius caucasicus aurantiacus*, from Mr. T. S. Ware.

To *Tulipa elegans alba*, from Messrs. Barr & Son.

To *Phyllocactus Brilliant*, from Messrs. J. Veitch & Sons.

To *Phyllocactus Exquisite*, from Messrs. J. Veitch & Sons.

To *Rhododendron The Queen*, from Messrs. J. Veitch & Sons.

To *Gloxinia Mr. J. Donaldson*, from Messrs. J. Veitch & Son.

To *Azalea J. T. D. Delywyn*, from Mr. C. Turner.

To *Pelargonium (show) Empress of India*, from Messrs. J. and J. Hayez.

To *Begonia Mammoth*, from Messrs. J. Laing & Sons.

To *Begonia Princess Victoria*, from Messrs. J. Laing & Sons.

To *Begonia Rosy Morn*, from Messrs. J. Laing & Sons.

To *Begonia Duchess of Portland*, from Messrs. J. Laing & Sons.

To *Begonia Profusion*, from Messrs. J. Laing & Sons.

To *Caladium Gaspard Crayer*, from Messrs. J. Laing & Sons.

To *Caladium Mrs. H. Veitch*, from Messrs. J. Laing & Sons.

To *Lunaria biennis variegata*, from Messrs. W. Cutbush & Son.

GLOUCESTER AND CHELTENHAM.

The annual spring show of this Society took place at the Winter Gardens, Cheltenham, on the 15th inst. There was a fine lot of Orchids and stove and greenhouse plants in the large tent, the other exhibits being in the Winter Garden. Vegetables were arranged down the centre of one part of the building, and in another the collections of stove and greenhouse plants, of which there were three competitors for twenty plants. Roses, herbaceous Calceolarias, and *Gloxinias* occupied the sides.

Mr. J. Cypher, Cheltenham, staged fine specimen Orchids, exhibiting excellent culture: *Cattleya Skinneri*, with twenty-two spikes of bloom, C. Mendeli, forty, and C. intermedia, with ten spikes were fine indeed; *Dendrobium thysiflorum*, D. Jamesianum, *Cymbidium Lowianum*, *Masdevallia Lindenii*, and *Cypripedium caudatum*, with thirty blooms, were the best of the remainder. Orchid compositors pronounced this to be the finest collection exhibited in Cheltenham. The 2nd prize, that exhibited by Messrs. Heath & Son, contained some large made-up pans of plants, the best being *Cypripedium Lawrenceanum*, with more than 100 flowers; a large mass of *Odontoglossum Pescatorei*, somewhat past its best, and *Dendrobium Jamesianum*, and a few *Cattleyas*.

The best nine for amateurs were shown by G. Neville Wyatt, Esq. (gr., Mr. Simcoe), these were large single healthy plants, the best of which were *Vanda suavis*, *Cattleya Mossie*, twenty blooms—a grand piece; *Ada aurantiaca*, with fifteen spikes; and *Cattleya Skinneri*. Sir A. Ramsey, Bart., was 2nd, his best plants being a *Cattleya Mossie*, with twelve blooms; C. Mendeli, with nine; and a good *Dendrobium suavisimum*.

Stove and Greenhouse Plants, in bloom.—Mr. Cypher was 1st, with superb specimens. A grand *Erica Cavendishiana*, a noble *E. ventricosa rosea*, *Anthurium Warlianum*, in fine condition; *Pimelea spectabilis*, F. Hendersoni, *Hederaa tulipifera*, *Francisca eximia*, *Staphanotis floribunda*, a sheet of bloom. 2nd, Mr. Mould, P-wsey, Wilts, his best plants being *Boeguinvillea glabra*, *Erica Cavendishiana*, *E. ventricosa rosea*, *Statice profusa*, and *Hederaa tulipifera*.

The class for ten *Azalea indica* was well filled. Mr. Cypher was 1st with very large well-bloomed plants, the best of which were *Cedo nulli*, 5 feet high, and 6 feet through; *Duc de Nassau*, 5 feet, by 6 feet wide; *Boi d'Hollande*, *Lady Polinorum*, a good white, and others equally fine. 2nd, Messrs. Heath & Son, with well-bloomed plants, of which we may note *Bounty of Surrey* and *Duc de Nassau*.

G. Neville Wyatt, Esq., took the special prize in this class for small plants, with many well-bloomed varieties.

Mr. J. F. Mould was 1st for six *Azalea indica*; 2nd, Mr. Wyatt.

Six *Azaleas*, grown in 10-inch pots.—1st, Messrs. Heath, well bloomed; 2nd, Mr. Cypher.

FIG. 111.—(1) ORANGE-FLY, CERATIS CAPITATA. a, Larva; b, pupa; c, in large orange; d, the size is indicated by the thread lines.

a species not included in catalogues; *Arisarum proboscideum* (*Bot. Mag.*, No. 6574), from the shaded woods of Upper Arno and Apennines, a very rare plant; *Azarum Hookeri*, var. *insignis*, Duch., the rarest species in cultivation. A vote of thanks was unanimously accorded to Mr. Lynch.

ROYAL BOTANIC.

At the exhibition of this Society, held on the 11th inst., and reported in our last issue, the following certificates were awarded.—

BOTANICAL.

- To *Disa tripetaloides*, from Mr. J. O'Brien.
- To *Cypripedium Elliottianum*, from Messrs. H. Low & Co.
- To *Acer Prince-Hendery*, from Messrs. Paul & Son.
- To *Juniperus canadensis aurea*, from Messrs. Paul & Son, and from Messrs. J. Veitch & Sons.
- To *Cattleya Mendeli albens*, from Mr. G. T. White.
- To *Richardia* (?) *Elliottiana*, from Mr. Knight.
- To *Abies excolta mutabilis*, from Messrs. J. Veitch & Sons.
- To *Cytisus scoparius Andraeanus*, from Messrs. J. Veitch & Sons, and Messrs. Paul & Son.
- To *Acer japonicum Laciniatum*, from Messrs. J. Veitch & Sons.
- To *Nephrolepis cordata compacta*, from Messrs. J. Veitch & Sons.

FLORICULTURAL.

- To *Syringa alba grandiflora*, from Messrs. Kelway & Son.

Six Specimen Azaleas.—Sir A. Ramsey, Bart., was the only competition, and had good plants.

The competition for six stove and greenhouse plants in flower was not heavy, and Mr. Mould was 1st, with *Erica depressa*, *Azalea sinensis alba*, and *Aphelxis macrantha purpurea*, &c.; and Mr. Wyatt was 2nd, his best plants being *Clerodendron Balfourianum*, and an *Anthurium Scherzerianum*.

The class for Pelargoniums was well filled with plants moderate in size: 1st, Mr. Lingwood; 2nd, H. Chapman, Esq. (gr., Mr. Sparkes).

Roses in pots call for little notice, the plants having lost much of their freshness; but the cut Roses were better: 1st, Messrs. Heath; 2nd, Mr. S. P. Budd, Bath. Mr. Cypher sent a fine stand of cut blooms of *Tea Rose Niphotos*, but was not for competition.

The class for twelve varieties of cut flowers only brought one competitor, Mr. Wyatt; the exhibit was a very fine one, and included six species of Orchids.

Cinerarias were well shown by T. P. W. Butt, Esq., Arle Court (gr., Mr. Marsh). Glorioxias were very fine, and were shown by five competitors, Messrs. Heath, Mr. Wyatt, Mr. Lingwood, and J. T. Agg-Gardner, Esq., M.P., being successful in the order named.

Calceolarias were not so good as usual. Mr. Wyatt had the best nine. The collections of herbaceous plants were only second-rate. The stand, or baskets grouped for effect, were scarcely up to those of former years. The groups of twenty plants arranged for effect, in or out of bloom, filled a large space: Mr. Cypher was 1st, with a nice lot of plants; 2nd, Messrs. Heath. The vases of cut flowers by ladies showed good taste, and were light in arrangement, and well blended in regard to colours. Miss Sturt was the winner of the 1st prize.

Fruit: Twelve Pots of Strawberries.—Mrs. Southwood, Colonel Rogers, and Lord Sudeley took the prizes for these in the order of their names; but the last-named exhibitor had nice fruit, and should have been put in the 2nd place—the fruit was a little bruised in travelling. A dish of excellent Peaches came from Arle Court; and good bunches of Lady Downes of 18-9, in excellent condition, from Mr. Wyatt; also three bunches, not so good, but rather shrivelled, of Mrs. Pince's Black Muscat.

Vegetables.—These products are always to be found in fine condition at this show, and the collections consisting of six dishes each were excellent, the heads of Asparagus being very large, Stratagen Peas, Potatoes, Beans, some fair Tomatoes, and handsome Cucumbers. Mr. Skinner was 1st, and Mr. Cook 2nd. The single dishes were very fine, Lord Sudeley, Rev. G. Coventry, Mr. Butt, Mr. Skinner, Messrs. Cook, Turk, and Smith being the chief winners of prizes.

The baskets of salad, always a feature here, were good for the season, and well put up, Messrs. Smith and Cook taking the 1st and 2nd prizes.

There was a large collection of well-grown English Tomatoes, Perfection being the variety shown by most persons.

The competition for the best four sorts of vegetables was well contested. Mr. A. Cook was 1st, with a very nice lot.

A large number of persons visited the show. It is to be hoped that the next show will be held in tents, so that the disagreeable glare from the glass during the sunny part of the day may be avoided, and choice plants suffer less in consequence. G. H. S.

BRITISH FRUIT GROWERS' ASSOCIATION.

MAY 15.—A meeting of this Association was held at the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, S.W. T. F. Rivers, Esq., in the chair. The special object of the meeting was to consider the scheme for the fruit report, which had been prepared by the sub-committee appointed for that purpose on May 1.

The scheme submitted and adopted unanimously is as follows:—The introductory chapters will deal with climate and soils in relation to fruit culture, land tenure, rent, rates, and tithes, hardy fruit culture, fruit culture under glass, fruit preservation, stocks, insects, fungi, diseases, and remedies. The report will include summaries of the chief counties in Great Britain and Ireland in reference to fruit culture, with descriptions of orchards and fruit farms, also of market gardens and private gardens where fruit culture is a special feature. The details will comprise extent of land occupied, situation, soil and subsoil, age and character of trees, varieties, stocks, and methods of culture.

Sections will also be devoted to markets, dealing with supplies, salesmen's charges, packing, and cost of carriage; to expenses, returns, and profits, and to the prospects of fruit culture, pointing out the land and districts best suited for fruit culture, the best systems, and the varieties recommended.

Arrangements are being made to collect the information required through the committee, the local secretaries, and the members of the Association, but assistance of any kind will be gladly welcomed.

It was announced that Mr. Joseph Cheal, of Crawley, was about to undertake a long tour in the fruit districts of the United States and Canada, and he was, therefore, appointed delegate from the Association, with the object of collecting as much information as possible bearing upon the fruit question, and he expects to be home in time to give the results of his experience at the September meeting in the Crystal Palace. Messrs. Castle and Gordon proposed to devote a holiday in Ireland this year to an investigation of the condition and prospects of fruit culture there, and were also appointed delegates from the Association.

ROYAL AQUARIUM.

MAY 21 AND 22.—The early summer show was held on Wednesday and Thursday last, when a pretty, if rather small exhibition resulted. Messrs. J. Laing & Son, Forest Hill, S.E., were awarded 1st for a group of plants arranged for effect (150 square feet), good sized Palms and Dracaenas with *Lilium longiflorum*, formed the back, and in front were *Begonias*, *Cattleya Trianae*, *Leschenaultia biloba major*, and small plants of *Caladiums*. A group of nine specimen *Caladiums* was also sent by Messrs. Laing, to whom the 1st place was properly accorded. Mr. H. James, Castle Nursery, Lower Norwood, S.E., was 2nd for a group, having *Anthuriums*, *Ixora Dixiana* (as a centre piece), and smaller foliage plants.

Mr. James bettered his position for Ferns, taking 1st, and also for eight specimen *Azalea indica*, having a creditable lot, in which *La superbe* and *Reine des Pays Bas* may be singled out. Mr. C. Turner, Slough, came in as a close 2nd with smaller specimens. For a group of hardy cut flowers and foliage, Mr. T. S. Ware, Tottenham, was 1st for an extensive collection, arranged in an artistic manner with undulations; among the plants included, was a white *Viola pedata*, *Cypripedium arietinum*, and *Peonia Wittmanniana*.

The 2nd prize was awarded to Messrs. Paul & Son, for a group in which was a good number of Tulips, hardy ornamental foliaged plants (Avers, Elms, &c.), *Lilacs*, *Rhododendrons*, hardy Azaleas, *Geum miltatum*, *Andromedas*, &c. Messrs. Barr & Son, Covent Garden, were placed 3rd, with a smaller lot, in which *Irises* were conspicuous.

Pelargoniums were best from Mr. C. Turner, Slough, who had finely flowered specimens.

Pansies and *Violas* were numerous and good. Messrs. Paul & Son, Cheshunt, had the best twelve *Violas* in pots. Mr. F. Hooper, Bath, led for twelve pots of fancies, and Mr. R. Dean for show varieties.

Messrs. Ryder & Son, Sale, had a good lot of Pansies (not for competition), all good show flowers, and Mr. F. Hooper, Bath, also contributed a good selection, with blooms of Pink Her Majesty.

Roses from Messrs. W. Paul & Son, Waltham Cross, were a very good display, the pot plants being very finely flowered samples; fresh and bright cut blooms were also sent.

Mr. R. Dean, Baling, had a small lot of cut hardy flowers, *Primulas*, &c.; and Mr. Moore, Regent Street, sent a group of decorative plants, including freely-grown *Erica Cavendishii*.

A NATURAL HISTORY MUSEUM FOR ABERDEEN.

In concluding a brilliant lecture to the members of the Aberdeen Working Men's Natural History Society the other evening, Mr. George Sim, A.L.S., naturalist, Aberdeen, dwelt on the necessity for Aberdeen having a public natural history museum. He said: "And now, in conclusion, allow me just a few words on a matter closely related to the subject we have been considering, and one to which interests, or ought to interest, every one in our good city. I refer to the want of a good natural history museum. Many people seem to have the opinion that such an institution can only be of use or interest to those few who make the study of natural history a hobby. There could be no greater fallacy. A museum properly arranged, having nothing but the products

of our own country within its walls, is an institution where everyone could study with profit, not only the external appearance of the creatures exhibited, but also learn something of their habits and modes of life. Then, and not till then, can we hope that the people will abstain from the many cruel practices presently directed against the most lovely and useful of living beings. Already the treatment meted out to the lapwing has been alluded to, but not less cruel is the reception given to the cuckoo on its yearly arrival on our shores, and yet few more useful visitors come to our land. For these and such like reasons would I advocate our being in possession of a public museum in Aberdeen, wherein the usefulness of every creature could be demonstrated. This is not a matter that calls for a large expenditure of money. I venture to think that if space were provided for such an institution, say in our public Library Buildings, there is little doubt but that many of you gentlemen would consider it a privilege which you would readily avail yourselves of, of depositing your collections therein. I am not suggesting to you what I am not prepared to do myself, for I am ready, as soon as proper accommodation is provided, to hand over my private collection for the good of the inhabitants. I would, therefore, appeal to you to help on the work which has already been begun by our good friend, Dr. James W. H. Trail. Carried out on something like the lines indicated, there is little doubt but that a good and useful museum would be in the possession of the inhabitants in a very few years, and almost at no cost whatever to them. By such means would those interested in particular branches of natural history study see what has been done by their predecessors, and thereby save generation after generation from going over the same ground. Let us remember, gentlemen, that 'poor bees, and wasps, and ants, and birds, and all that now animate life,' on which he looks with supercilious contempt, man is destined one day to learn what in truth he really is."

EDINBURGH BOTANICAL.

MAY 8.—The Society held its first summer meeting in the club-room at the Royal Botanic Garden, under the presidency of Mr. Lindsay, who afterwards conducted the members of the Society through the glasshouses and over the rock garden. Mr. Arthur Bennett gave "Notes on the Records of Scottish Plants during 1889." Mr. Sewall sent a paper on "The use of Spaghnum moss in Mr. Hanbury's garden in the Riviera." Perhaps the most interesting paper of the evening was by Dr. Aitchison, who described the equipment of a botanical collector on the Afghan frontier. The 30 lb. bundles of boards and drying paper, as well as the small sharp pointed pick on a long handle, after the fashion of a geological hammer, given to each coolie who collected plants in lieu of the usual botanist's spud, were new ideas to the experienced collectors of home botanical specimens present. Mr. Lindsay gave the usual report as to the growth of vegetation in the Royal Botanic Garden in April; so did Mr. Bullen for the Glasgow Garden.

Amongst the exhibits were:—From the garden, a collection of plants in pots in flower, mostly rare hardy plants.

From Dr. Paterson, Bridge of Allan, flower and photograph of *Rhododendron Falconeri*.

Report for April, 1890, by Robert Lindsay, Curator, Royal Botanic Garden, Edinburgh.—The month of April was dry and cold generally, with easterly wind. The thermometer fell below the freezing-point on fifteen occasions; the total amount of frost registered was 54°, as against 67° for April, 1889. The lowest readings were on the mornings of the 12th, 13th, 20th, 27th, and 28th of the month, when the glass fell to 27°, 25°, 23°, 25°, and 26°, respectively. The lowest day temperature was 47°, on the 17th; and the highest, 67°, on the 30th.

The collective amount of frost registered this season up to the end of April is 56½°, as against 34½° for the same period last year. The following is the distribution for each month:—September 3°, of frost; October, 2°; November, 38°; December, 70°; January, 45°; February, 103°; March, 49°; April, 54°. The lowest point reached this season was 20°, or 12° of frost, which occurred on March 20. Notwithstanding the cold nature of last month, vegetation generally has made good progress. The rock garden was very attractive during the month, from the large number of plants in blossom; 150 species and varieties came into flower in April, many of

which display unwonted vigour. Of the forty spring-flowering plants annually recorded to show their periods of flowering, the following came into flower:—*Adonis vernalis* on the 2nd, *Aubrietia grandiflora* on the 9th, *Fritillaria imperialis* on the 10th, thus completing the list much earlier than usual.

Register of Spring-Flowering Plants, showing Dates of Flowering at the Royal Botanic Garden, Edinburgh, during the years 1888, 1889, and 1890.

No.	Names of Plants.	First Flowers opened.

Extract from Record of Temperature, Vegetation, &c., in the Botanic Garden, Glasgow. By Robt. Ballou, Curator. April, 1890.—The temperature fell below the freezing point twelve times during the month; the lowest reading was 1° during the night of the 12th. The total readings were only 17°. A large number of fine and dry days are recorded, but of these many were comparatively sunless here, cold winds were very prevalent, and from all points of the compass. The rainfall was light.

All forms of plant life are better for the little retardation, so that, notwithstanding the mild winter, the spring is not an unusually early one, the only plants which are in a more forward state than usual are those which are capable of existence, and even flourish, after the most rigorous winters. Many deciduous trees and shrubs are not showing so much bloom as was anticipated; but it is yet early to judge of fruit prospects, the bloom being yet in an embryo state.

NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

A WELL attended meeting of the members of this Association was held in the Christian Institute, Aberdeen, on Wednesday evening, the 7th inst.

Mr. Smith, the President, occupied the chair. The chief item on the agenda card was a paper by Mr. Alexander Robson, of Messrs. William Smith & Son's, seedsmen, Aberdeen, on the "Propagation and Improvement of Cultivated Plants." Mr. Robson reviewed the improvements of the last twenty years, showing that immense progress had been made in that time, mainly owing to the increased activity of hybridists and cross-breeders. This activity was due very much to the painstaking work of Darwin, who did more than any other man to make clear the knowledge of the effect of crossing and hybridising upon plants. He instanced Darwin's experiments, giving chief prominence to cross-breeding, as being the means by which almost all recent improvements had been effected. Darwin had shown that cross-breeding improved the quality and productiveness of the stock. He gave detailed lists of vegetables and flowers, showing that, of the principal varieties of twenty years ago, new and greatly improved varieties had since superseded them. The science of horticulture had been making as much progress as any of the other arts and sciences.

Mr. Robson remarked that Darwin, Burbidge, and Dr. Lindley, had marked out clearly the distinction between crossing and hybridising, and it would be found in their books. The confusion in the two terms all resulted from popular inaccuracy in the use of them. It was only within certain degrees of affinity that hybridisation was possible. He defined the crossing of one species with another species as a hybrid, and the crossing of one variety with another variety of one species as a cross.

With regard to the relative merits of old and new varieties, Mr. Mortimer thought careful cultivation had a good deal to do with it. Some of the old varieties, for instance, of Cabbages, Potatoes, and Peas, far excelled the new in his opinion.

Mr. William Reid, the Secretary, agreed with Mr. Mortimer's remarks, although admitting, along with Mr. France and others of the members, that crossing had done a great deal to strengthen and improve certain sorts of plants.

Mr. Reid remarked further that till within the last ten years, cross-breeding was done in a haphazard way.

Mr. Robson, at the close of a somewhat animated discussion, was warmly thanked for his paper. The members at this stage proceeded to inspect an exhibition of flowers, now becoming a feature of each meeting of the Society, and which are doing, not only good work among the members themselves, but to the public, who on the day following the meeting are allowed to inspect the display free.

The exhibits forward were largely illustrative of the paper read by Mr. Robson. Mr. Gregor, Fairfield, showed a collection of Orchids—exceptionally well flowered—a box of Polyanthus and Auriculas, for which he was awarded the Association's Cultural Certificate. There were three boxes of Daffodils, eighty varieties; a box of herbaceous flowers, thirty varieties; and a box of Polyanthus and Primroses, thirty varieties; two boxes of Pansies, sixty varieties; ten pots of Sieboldii, ten varieties; and a climbing Rose of rare merit from the nurseries of Messrs. James Cocker & Son, for which a similar honour was awarded. Mr. Stephen, Crathes Castle; and Mr. Ross, Cranford, also received Certificates. The other exhibitors were Mr. McPherson, Delmount; Mr. Morrison, Waterton; and Mr. Mortimer, Tullos.

A large number of the public visited the display on Thursday. At the close of the meeting notice of motion was given to the effect that the Association take into consideration the advisability of offering prizes for collections of spring flowers. Votes of thanks to the chairman and exhibitors terminated a most enjoyable and instructive meeting.

CULTURAL MEMORANDA.

THE BROMPTON STOCK.

SOMETIMES this variety of Stocks is raised from seed sown in pans in June, and subsequently pricked off on to well-prepared beds. But with equal success the plants may be reared by sowing outside, and treated similarly to Wallflowers. If the seed be sown about this time of the year, and when large enough pricked off on firm soil on a sunny border, allowing plenty of space between each, so as to afford abundance of air to pass among them, some

fine strong and well-ripened plants will result that will produce abundance of sweetly scented blooms the following spring. In cold localities it is prudent to pot up the plants in September, and winter them in cold frames, as not infrequently the plants will suffer from frosts during the winter months if left outside. These stocks are good for the cool conservatory, where, with good treatment, the plants will bloom well. H. M. [Provided the plants are plunged in fine coal-ashes and protected from rain and snow by glass shades, cold in our ordinary winters will hardly hurt them. They should be more commonly grown than they are. Ed.]

PRIMROSES.

If not already done, the plants that have bloomed in pots should be divided and planted 12 inches apart. Single offsets will grow into capital stuff by the time of lifting and potting them up. The Harbinger is a nice white variety that blooms well and is much admired.

SOLANUM CAPSICASTRUM.

The old plants, having been slightly pruned back and young growths started, should, when hardened off a little, be planted out; and these, with careful attention during the summer months, will make good plants, and set plenty of berries. Plenty of water must be afforded the plants in dry weather, and syringing sometimes overhead after a hot day will greatly benefit the plant.

EUPATORIUM OBOVATUM.

This useful early winter-blooming subject thrives equally well when planted out young; cuttings struck early, if planted out now 18 inches apart on well-tilled soil, and the tops pinched a couple of times, will grow fine plants by September, and produce abundance of bloom. H. Markham.

VARIORUM.

BIOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS.—From the list of those published in the *Journal of Botany* for April, we extract the following:—

- "PARKINSON, JOHN (1567-1650): b. Nottinghamshire (?), 1567; d. London, Aug. 1650; bur. St. Martin's-in-the-Fields. Apothecary. King's Herbalist ('Botanicus Regius Primarius'). 'Paradisus Terrestris', 1629. 'Theatrum Botanicum', 1610. Had a garden in Long Acre, 'Theatrum', 609. Pult. i. 138; Rees; Pritz. 240; Jacks. 589; London, 'Arboretum', 49, 53. Journ. Hort. xxviii. 1875, 493, with portr. Portr. by C. Switzer in 'Paradisus'; and one by W. Marshall in 'Theatrum', re-engraved in Richardson's Illustr. to Granger. *Parkinsonia* L.
- "PARRIS, JOHN DAMPER (fl. 1823). Collector for Hort. Soc. in China and Java, 1823. Trans. Hort. Soc. v. 427.
- "PARNELL, RICHARD (d. 1882): b. Devonshire; d. Edinburgh, 1882. Ichthyologist. M.D. F.R.S.E. Orig. Memb. Bot. Soc. Edinb., 1836. Lived in Jamaica, 1839. 'Grasses of Scotland', 1812; 'Grasses of Britain', 1845; both with figs. drawn and engraved by himself. Pritz. 241; Jacks. 589; Journ. Bot. 1883, 30; R. S. C. iv. 763. Herbarium of grasses at Linn. Soc. *Poa Parnellii* Bab.
- "PARRY, CHARLES CHRISTOPHER (1823-1890): b. Admington, Worcestershire, Aug. 28, 1823; d. Davenport, Iowa, Feb. 20, 1890. Went to America, 1832. M.D. Botanical explorer and collector. On Mexican Boundary Survey, 1850; in Rocky Mountains, 1861. Botanist to Agric. Dept. Washington, 1869-71. 'Chorizanthe', 1884, 1889, and various bot. papers. Friend of Torrey and Gray. Herb. at Davenport Acad. Nat. Sciences. Jacks. 589; R. S. C. iv. 767. viii. 565; 'Garden and Forest', iii. 120; Bull. Torrey Bot. Club, March, 1890. *Pinus Parryana* Engelm.
- "PATTON, GEORGE (1803-1869): b. 1803; d. Glenalmond, Perth, Sept. 30, 1869. Lord Justice Clerk

of Scotland, 1867, as Lord Glenalmond. Chairman Oregon Bot. Assoc. Introduced *Cypripedium Leucostictum* and *Abies Pattoniana*. (Gard. Chron. 1869, 1043.)

"PATRON, SIR JOSEPH (1803-1865); b. Milton Bryant, Beds., Aug. 3, 1803; d. Sydenham, June 8, 1865. F.L.S., 1833. Foreman, Chiswick Arboretum, 1824. Superintendent, Chatsworth, 1826. 'Magazine of Bot.', 1834. Travelled through S. Europe and Levant, 1838. 'Pocket Bot. Dictionary,' 1840; Knighted, 1851. M.P. for Coventry, 1854. Fritz 242; Jacks. 590; Proc. Linn. Soc. 1865-6, lxxxi, Gard. Chron. 1865, 554; Journ. Hort. vii. (1865), 416, with portr.; and ix. 12. Journ. Bot. 1865, 231, *Pastoria* Liail.

"PEARCE, RICHARD (d. 1868); d. Panama, July 19 1868. Of Stoke, Devonport. Collector for Messrs. Veitch and Bull. Plants at Kew and Brit. Mus. Journ. Bot. 1868, 320; Gard. Chron. 1868, 874, 893 Journ. Hort. xv. (1868), 134. *Stenonacanthus Pearcei* Hook. f.

THE WEATHER.

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named;—a "Day-degree" signifying is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.			
	ACCUMULATED.								
	Above 42° for the Week.	Day-deg.	Day-deg.	10ths In.					
1	2	45	+ 111	- 70	2	96	15.9	26	27
2	2	57	+ 62	- 60	6	4	11.0	28	29
3	2	67	+ 54	- 93	3	70	7.7	32	27
4	1	78	+ 13	- 3	3	75	8.2	45	34
5	1	72	+ 13	- 27	2	80	4.0	49	29
6	2	86	+ 22	- 6	1	71	9.6	52	31
7	2	92	+ 70	- 74	13	85	18.1	36	30
8	av.	63	+ 49	- 1	6	11.4	3.1	28	
9	av.	69	+ 16	- 12	1	13.7	4.6	34	
10	1	33	+ 15	- 54	1	90	11.4	37	30
11	2	53	+ 7	- 14	5	17.0	3.4	33	
12	1	80	+ 105	- 22	3	85	11.0	67	41

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing and Pasture Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending May 17, is furnished from the Meteorological Office:—

"The weather has been generally fair over the more south-eastern parts of the kingdom, but unsettled and rainy in the west and north. Thunderstorms were experienced in many parts of England and the Channel on the 11th and 12th.

"The temperature has been a little below the mean over Ireland, while in England, S.W., and N.W., it has just equalled the normal; in all other parts of the country a slight excess is shown. The highest of the maxima, which were registered on rather irregular dates, ranged from 61° in Ireland, S., to 68° in England, S.W., and to 70° over southern, midland, and eastern parts of England. The lowest of the minima were recorded in most places on the 15th, and varied from 34° in Ireland, N., and from 36° in Scotland, N. and E., Ireland, S., and England, S.W., to 41° in England, S., and to 44° in the Channel Islands.

The rainfall has been less than the mean in the south and east of England, but more than the mean in all other districts—especially in the north-west and north.

"Bright sunshine has been more prevalent than it was last week in most districts, the percentage of the possible duration having ranged from 26 in Scotland, N., and 28 in Scotland, E., to 52 in England, S., and to 67 in the Channel Islands."

MARKETS.

COVENT GARDEN, May 22.

[We cannot accept any editorial responsibility for the submitted prices, which, however, are published as a matter of every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

Large supplies of indoor fruit to hand. Prices lower, Grapes especially meeting with a very dull trade. Business generally steady. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

ORCHID-BLOOM in variety.

SEEDS.

LONDON: May 21.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write that to-day's market presented quite a holiday appearance. Clover seeds all round are neglected, but a few speculative sales are noted of Trefoil. The sowing demand for Tares still continues. Canary seed maintains its advance of several shillings per quarter. Lower prices are taken for Hempseed. Choice blue Peas have become extremely scarce. Feeding Linseed is dull.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending May 17:—Wheat, 32s. 6d.; Barley, 27s. 7d.; Oats, 19s. 3d. For the corresponding period last year:—Wheat, 29s. 11d.; Barley, 22s. 10d.; Oats, 18s. 1d.

FRUIT AND VEGETABLES.

SPITALFIELDS: May 21.—Good supplies of all kinds of farm and market garden produce. Demand fair. Short supply of fruit. Demand very good. NOTICES TO CORRESPONDENTS.

*. Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

BROOKLYN: J.H.H. The new variety you sent for our inspection has a well-protected, white, round head,

of delicate flavour when cooked. The total height of the plant was only 18 inches, and actual length of stem above-ground less than 6 inches. It is an acquisition.

IVY-LEAVED PELARGONIUM: *Buz*. It is a case of the growth of the buds being arrested, probably by cold or too much water at the root. The variety is more susceptible to injury from those causes than the others you cultivate.

NAMES OF PLANTS: *J. Skyosa*, 1. Polydium trifurcatum; 2. Hymenophyllum axillidum; 3. H. fucoides; 4. Asplenium furcatum; 5. Polydium glaucophyllum; 6. Alsophila latevagens, Baker.—F. B. D. Paulinia thalictroides; stove plant.—Gurteen, Clematis montana.—F. D. Ophrys muscifera.—Llandaff, 1. Dodecatheon Meadia; 2. Spirea Ulmaria (golden leaved form); 3. Ranunculus acris, double; 4. Pulmonaria officinalis; 5. Campanula glomerata; 6. Saxifraga granulata, double flower.—J. W. K. Iris gramineus, was overlooked last week.—Stanold, 1. Cytisus albus; 2. Saxifraga granulata, double; 3. Diplopappus chrysophyllus; 4. Acaelypha tricolor; 5. Onoid.—A. B. 1. Veronica gentianoides; 2. V. serpyllifolia; 3. Lamium Galeobdolon; 4. Anemone italica; 5. J. P. S. 1. Witesnia corymbosa; 2. (labelled 3). Ophiopogon Jaburan; 3. Lavatera arborea variegata; 4. Chorozenia ilicifolia; 5. Spirea Thunbergia; 6. Eriurus alpinus.—J. B. 1. Ribes aureum; 2. Doronicum plantaginatum; 3. Aspidolobus luteus; 4. Geranium, sp. not recognised; 5. Geranium pratense, pale-flowered form; 6. Veronica gentianoides. T. B. Picea (or Abies) Morinda, not Larix Kämpferi; white Scilla very fine.—A. W. 1. Retinospora pisifera var. plumosa; 2. Cupressus Lawsoniana; 3. Thuja plicata; 1. Retinospora obtusa; 5. Meconopsis cambica.—G. S. S. 1. Lychnis diurna, double; 2. Saxifraga muscoides purpurea; 3. S. muscoides; 4. Saxifraga, no leaf sent; 5. Primula japonica; 6. Iberis coriifolia; 7. Ceanothus aurucus.—S. A. Polygonum lapathifolium. E. C. W. 1. Alnus cordata; 2. Spirea prunifolia; 3. Choisya ternata.—J. M. 1. Eupatorium primum; 2. Kerria japonica fl.-pl.; 3. Spirea prunifolia; 4. Spirea confusa; 5. Ribes aureum; 6. Forsythia viridissima.—H. H. 1. Vaccinium myrtillus; 2. Gautheria Shallon; 3. Acer campestre, common Maple. Next time address such a question to the Editor.—J. M. P. The Jew's Ear fungus, Hærnola Auricula Judæ.—E. P. E. 1. Rhubium alpinus; 2. Fraxinus ornus; 3. Berberis Wallrothiana; 4. the Quince, Cydonia vulgaris; 5. Farfugia—next week; 6. Acacia miltorfolia.—F. G. 1. Berberis vulgaris, var. atropurpurea; 2. Syringa europæa; 3. Berberis vulgaris; 4. Laurus sassafras; 5. Cytisus scoparius var.—E. Richards. Podosporium undulatum.

ORCHID PEAT, best quality; BROWN FIBROUS PEAT for Stove and Greenhouse use. RHODODENDRON and AZALEA PEAT. Samples and Prices to WALKER AND CO., Farmborough, Hants.

SLUGGICIDE (Registered).—Certain death to slugs; harmless to plant, vegetable, and animal life. Delicate seedlings are absolutely secure when sprinkled with Sluggicide. Registered. Wholesale and Retail, THE GILGIE CO., 6, Mary-le-bon Street, Bristol. Agents wanted.

SLUGS.—Save your Garden Produce by using LIQUID MANURE ESSENCE, Inodorously from Greenhouse and Garden, 5s. per gallon—will make from 50 to 100 gallons.

ARTIFICIAL MANURE, without Smell, will produce grand growths, unsurpassed for Fruit and Vegetables, 112 lb. 2s.; 56 lb. 11s.; 28 lb. 6s.

ANTI-MILDEW, 10s. per gallon. PLANT FUMIGATOR, combining Hot or Fish Stakes, Disinfecter, or Domestic Soap, 4 feet 6 in. high, 27s. 6d.; 6 feet, 35s.

G. C. BROOKES & CO., 72, LEADEN HALL STREET, E.C.

GARDEN REQUISITES. TWO PRIZE MEDALS. Quality THE BEST in the Market. (All sacks included.) COCOA-NUT FIBRE FEEBLY (by Chubb's special process), 10s. 6d. per 100 lbs. net weight. BEST CHINA SLIVER SAND, 1s. 6d. per bushel; 11s. half ton; 24s. per ton. Yellow Fibrous-Lanx, Compost, Leaf-mold Peat Moss, 1s. per bushel. Super Phosphate, 3s. 6d. Paper, 4s. per lb. Special Manures, Peat-Moss Lifter, Crushed Bone, Virgin Cork, Shell-String, Charcoal, Mushroom Spawn, and Russia Mats.

GENUINE ORCHID PEAT, 8s. 6d. per sack; 5 sacks, 40s.; BEST BROWN FIBROUS PEAT, 4s. per sack; 5 for 20s. 6d. BLACK FIBROUS PEAT, 4s. 6d. per sack; 5 for 20s. COARSE SILVER SAND, 1s. 6d. per bushel; 11s. half ton; 24s. per ton. Yellow Fibrous-Lanx, Compost, Leaf-mold Peat Moss, 1s. per bushel. Super Phosphate, 3s. 6d. Paper, 4s. per lb. Special Manures, Peat-Moss Lifter, Crushed Bone, Virgin Cork, Shell-String, Charcoal, Mushroom Spawn, and Russia Mats.

HEATING OF ALL KINDS.

Testimonials.

"SIR.—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACLESFIELD."

"Hornby Castle, Lancashire, February, 1890.
"Major FOSTER has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

"Estate Office, Ripley, Yorkshire, January 23, 1890.
"SIR HENRY EGGLEY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

HELLIWELL, 9, Victoria Street, Westminster.

“The Demon”
Insecticide and Cleanser

HIGHLY CONCENTRATED — MIXES INSTANTLY WITH WATER. For use in the Conservatory, Greenhouse and Vinery; Flower and Kitchen garden, the Hop-yard, and the Orchard.

Practically Tested by Practical Gardeners. Acknowledged to be the most Perfect Insecticide yet Invented.

From Mr. R. TURVEY, Head Gardener to Sir Richard Webster, Q.C., M.P., Waterford gardens, Cranleigh, Surrey. —“ Yours is the best Insecticide that has come under my notice; it not only destroys the ‘pests,’ but imparts a healthy look to the plants.”

From Mr. F. A. H. The Gardens, Government House, R.M. College, Yorktown, Surrey. —“ I am pleased to say I found your Insecticide all I could desire after a good trial; safe for the most tender foliaged plants.” I can unhesitatingly recommend it to any one.”

From Mr. G. WILLIAMS, Nurseryman and Florist, Trumpington Road, Cambridge. —“ We have given Demon Insecticide a fair trial, and believe it to be the best preparation for the destruction of insects, &c., infesting plant life. We shall continue to use it, and recommend it to our friends.”

Farth of Testimonials and all particulars Free on application.

GARDENING APPOINTMENT.

Mr. J. MAYHEW, late Gardener, Sharston Hall, North-nidge, as Gardener to HERBERT MARSLAND, Esq., Woodbank, Stockport.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Kept Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this is in a serious case of great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish remitted.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others—it is very important as resulting by Postal Order that it should be filled in payable to No. 42, DRYDEN LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

RICHARD SMITH AND CO. BALE to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.

SPECIAL RAMS for HIGH FALLS to send up to Two Gallons out of every Five Gallons passing through them.

Fig. A.

This Ram raises a portion of the same water that works it.

This View represents Fig. A. Ram forcing up a part of the same water that works it, which is supplied from a spring. Special Rams of A make can be supplied to force to a height of 800 feet.

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From Mr. THOMAS VARLEY, Agent to the Trustees of the late William Roundell, Esq., Gledstone Estate, West Marton, Skipton, August 11, 1887.

"DEAR SIR,—The Patent Hydraulic Ram you fixed five years ago is still working as well as it did on the day it started. It is driven by spring water carried along the hill-side in 550 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of two miles from, and at an elevation of 280 feet above the Ram. The water is then gravitated through several pipes and branches, having a total length of about four miles, for the supply of the mansion, gardens, stables, estate workshop, and steam boiler, the village of West Marton, and several farms. There are five fire-pipes inside the mansion, and seven outside, and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilize the water for other farms. I have much pleasure in being able to report as above."

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

"DEAR SIR,—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only sixpence in repairs for a new stud (my blacksmith made); the second Ram you put down to supply an off-hand farm, has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water supply is the greatest possible comfort to me."

"Yours faithfully,
"C. PAGE WOOD."

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

"DEAR SIR,—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry-weather flow being 6 pints per minute, with which quantity you promised to work the Ram, forcing through 330 yards of delivery pipe to an elevation of fully 144 feet, but out of 5½ pints per minute, 166 gallons per day are sent up; and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,—I am, dear Sir, yours faithfully,"

"MATTHIAS SMITH."

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Daley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 65 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middlesbrough, September 26, 1883.

"DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate for Mr. C. F. H. Bolckow are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11½ gallons per minute they are lifting 2200 gallons, and when working full power 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since." (The delivery pipe in the above case is 9000 feet in length.)

From CAPTAIN TOWNSEND, Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 600 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, HYDRAULIC ENGINEER, ACCRINGTON, LANCASHIRE.

Editorial Communications should be addressed to "The Editor;" Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W.C. Printed by WILLIAM RICHARDS, at the Office of Messrs. BRADBURY, AGNEW, & Co. (Limited), Lombard Street, Precinct of Whitefriars, City of London, in the County of Middlesex, and published by the said WILLIAM RICHARDS, at the Office, 41, Wellington Street, Parish of St. Paul's, Covent Garden, in the said County.—SATURDAY, May 24, 1890. Agent for Manchester—JOHN HEYWOOD.

SUPERB ORCHIDS, CHEAT.—Thousands to select from. Write for List, free. P. McARTHUR, The London Nursery, 4, Maude Vale, London, W.

THE BEST PRIMULA.—CARTERS' H

Thursday, June 12.

Twenty five plants of MASDEVALLIA HINCKSIANUM, MR. J. C. STEVENS has received instructions to include the above in his SALE by AUCTION, at his Great Rooms, 35, King Street, Covent Garden, W.C., on THURSDAY, June 12.

On view morning of Sale, and Catalogues had.

Ashford, Middlesex.

FRUIT FARMS, MARKET GARDEN, and ACCOMMODATION LANE, in Lots to suit Small Capitalists and Investors, the purchase-money being payable by instalments extending over nine years; 73 acres of important Freehold Land, having the extensive frontage of 254 feet to the main road, and 1/2 mile to the sea; a mile distant only from Ashford Station on the London and South Western Railway, and 17 miles from London, thus being within easy reach of the metropolitan markets. The land is situated in a popular residential locality, and the nature of the soil renders it peculiarly adapted to the Cultivation of Fruit, Flowers, and Vegetables, an industry extensively carried on in this neighbourhood. The present Sale therefore affords an opportunity for Purchasing Small Freeholds in a proverbially healthy locality, and developing the combined advantages of residence with a lucrative, pleasant, and refined occupation. With possession on completion of these.

MESSES. HUMBERT, SON and FLINT are instructed to SELL the above by AUCTION, at the Mart, Tokenhouse Yard, E.C., on WEDNESDAY, June 18, 1890, at 2 o'clock precisely, in numerous Lots.

Full particulars may be had of Messrs. R. S. TAYLOR, SON and HUMBERT, Solicitors, 4, Field Court, Gray's Inn, W.C.; at the Mart, E.C.; and of the Auctioneers, 11, Serle Street, Lincoln's Inn, W.C., and Watford, Herts.

Cut Flowers, Plants, and Bulbs.

We hold Sales, every week. Reference to senders of orders, please, to apply.

MESSES. POPE and SONS, Sale Rooms, 6, Philip Street, adjoining Market Hall, Birmingham.

WANTED, TO RENT, on Lease, 6 to 20 Acres of good LAND, for Nurseries, 15 to 20 miles from London, near station and Post Office, with Dwelling house, if possible. Apply, S. C. Gardner's Chronicle Office, 11, Wellington Street, Strand, W.C.

NURSERY, small, all at £150—part can remain if wished. Six roomed House, Stables, Fowl houses and Sheds, 6 long Greenhouses, all stacked. Same hands may be had. Apply to SELL, through London affairs, Good Jobbing Business. A fortune to a working Gardener. Pretty place, one mile from Crystal Palace, Long Lane.

Apply, DAMS, 3, Belvedere Road, Upper Nurwood, S.E.

Enfield, 6 minutes from the G.N.R. Station.

To Gentlemen fond of Horticulture, combining pleasure with profit.

A MEDIUM-SIZED Detached RESIDENCE, containing 8 Rooms, Bath room, 3 Reception rooms, Offices, &c. In the Garden are Vinery, 70 to 25 feet; Orchard-house, 70 to 12 feet; 3 long Greenhouses, forming orange greenhouse, 90 by 22 feet, with Frames adjoining, all economically worked from one boiler, auxiliary boiler, small Kitchen garden and Orchard, with back entrance. Lease 21 years, Rent £50 per Annum. Messrs. H. E. FOSTER and CRANFIELD, 6, Foultry, E.C., and Enfield.

To Florists. N.W. District. TO LET, at a nominal rental, LARGE GARDEN, with Greenhouses (one very large), Orchard-house, Vinerias, Frames, &c., in thorough working order, on a main road. Address, M. R. Craven Park, N.W.

TO BE LET, within 15 miles of Covent Garden, on advantageous terms, to work out short lease, a large ESTATE and FINE GREENS, ESTABLISHMENT, containing 25 Houses, and everything in full business order. About 4 tons of Grapes, &c., are annually grown. Good Dwelling-house, Cottage, Stables, &c. The proprietor having received a very high offer, it is the sale case of the above being now open.

H. A. H., care of Mr. Urwin, Fruit Salesman, Covent Garden Market, W.C.

TO LET, a well-established NURSERY, about 12 acres in extent, well stocked and in the condition, situated near a large city—Full particulars on application to A. E. Gardner's Chronicle Office, 4, Wellington Street, Strand, W.C.

London, N.W.

TO BE LET, on Lease, an old-established NURSERY, occupying good position in a most fashionable Residential District. There are 12 Greenhouses, with several Pits, large Show-house, and 3 acres of Land. Vendor will grant Lease for 21 years, Rent £1,000 per Annum. Full particulars will be sent post-free, on application to the Co., The Vineyard and Nurseries, Garden, near Liverpool.

Messrs. PROTHORPE and MORRIS, 67 and 68, Cheapside, E.C.

STAND No. 3. SHED 1. DAFFODILS ILLUSTRATED.

(New Series.—Copyright.) If you want real good illustrations of best Daffodils, there are none better than what are published by Wm. Bayler Horticulturist of Cork. Vide "Gardener's Journal" for March, 1890. Apart altogether from Price or Trade, I am now publishing a "Book" of 14 pages, entirely devoted to what is good among Daffodils. The Drawings—many of them Conference selections—are by my nice gardener Hartland, engraved by Welch of London, and finished in a most artistic manner. Post-free, 1s 6d. The key to the same—descriptive and priced—will be published in July. Trade Circulars of Market Daffodils now ready. Quotation special for quantity, and prompt July delivery guaranteed. Daffodil ground, 100 acres. Wm. BAYLER HARTLAND, Seedsmen, Ard-Cairn, Cork.

50,000 LOBELIA, Emperor William, warranted true from cuttings. JOHN SOLOMON offers the above in thorough good lot at 2s. 6d. per 100, 20, 1 per 1000, for cash with order, package included. Queen's Road Nursery, Walthamstow, E.

To the Trade. FERNS!—FERNS!!—FERNS!!!

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1887. The "Journal of Horticulture," of June 8, says—
"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."
They were first introduced in the year 1856.

And thousands of un-solicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.
The following are their Advantages over all others—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

REDUCED PRICES OF GREEN'S Patent ROLLERS, For Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths, &c. Suitable for Hand or Horse Power.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.
For PRICES of DONKEY, PONY, and HORSE MACHINES, see LIST.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

ROYAL GARDENS, WINDSOR, January 28, 1890.
To Messrs. GREEN & SON, Limited.
Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1856; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself. As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them—they are unequalled. During the season I have them daily in use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Aldershot. I shall feel a great pleasure in recommending them to all my friends.
I remain, dear sirs, yours very truly,
THOMAS JONES.

Wellingborough, February 4, 1890.
To Messrs. Green & Son, Leeds.
Gentlemen.—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I find them more durable and do their work better than any other machines I have seen.
I am, gentlemen, yours truly,
DAVID PERCIVAL,
(Gardener to W. Rolt, Esq.),
Cottingham, Hill, February 13, 1890.

To Messrs. Green & Son, Limited, Leeds.
I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 36-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it for repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose Price List.
I am, gentlemen, yours truly,
JOHN BAYNTON,
Ivy Bank, Broadway, Worcester, April 13, 1884.
Gentlemen.—Some fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever since.
I am, yours faithfully,
Messrs. Green & Son, Leeds. C. FRENCH HARTLEY.

Bathesda, Ashford, Kent, June 14, 1878.
Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer anyone to me, and I will then show them the S. M. at work, and I shall show it to all I can.
I am, yours truly,
Messrs. Green & Son, W. H. MOULD.

Kilfrury, Hungerford, April 26, 1883.
Sirs,—I shall be glad of a list of your Lawn Mowing Machines priced. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Monday was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is surprising to think of the work it has done, and done well.
Yours faithfully,
Messrs. Green, Leeds. ALFRED T. BAZETT.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

GREEN'S Patent LAWN TENNIS COURT MARKER.

GREEN'S PATENT GRASS EDGE CLIPPER

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.
The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where First-class persons can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day as they are received.
The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.
N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

ARRIVING at New York by the *Etromia*, on
 December 2, I proceeded, as soon as pos-
 sible, to the world-famed establishment of Peter
 Henderson, who, since my visit, has enlaid a
 long and useful life among us. The seed shop
 in Cortlandt Street is a fine building, adapted to
 meet the requirements of a very large trade.
 The nurseries are situated in Jersey City, about
 half-an-hour's ride by ferry and tram. Mr.
 Davis, the manager, described the nursery to me
 as a large plant factory, and such in truth it is.
 Roses, Verbenas, Carnations, Bouvardias, &c., are
 grown by the thousand, in a very rough way,
 which suits the Americans however, and brings
 in a good profit. During the spring and summer,
 Coleus, Pelargoniums and Fuchsias are grown in
 similar quantities, but Messrs. Henderson find
 there is only a very small demand for stove and
 greenhouse foliage plants, such as Crotons,
 Dracenas, Palms, &c., which accounts for their
 growing only a very small number of them. They
 have a large quantity of glass, principally span-
 roofed houses, one or two of them are heated by
 steam, the majority by hot-water pipes in the
 ordinary way, and anthracite coal is the fuel
 used, and in fact is the only kind of coal attain-
 able in America.

Cut flowers of Roses are sold as well as plants,
 and bring in good prices during the winter
 months. One splendid Rose house for established
 plants, about 300 feet long and 20 feet wide,
 half span, facing S.W., was a fine sight at
 the time of my visit, the plants were even then
 growing freely, in full foliage, and had a large
 number of buds showing, in short, were looking
 as Roses do in June with us at home. I had
 often heard what beautiful Roses they get in
 New York during the winter months, and a look
 at these plants explained all difficulties; more-
 over, our cousins at New York get a clearer sky
 and much more sunshine in winter than we do,
 which is a great gain in all kinds of plant
 forcing. The plants are grown in good
 tufty loam with plenty of bone dust added,
 and are planted out in wooden troughs, vary-

ing in depth from 9 to 18 inches, and raised up near to the glass above the hotwater pipes, &c., a nice growing temperature is maintained. H.P. Magna Charta was flowering well, and others were coming on; most of the plants belonged to this class, but a few Teas such as Madame de Watteville, Perle de Lyon, Niphotos, &c., are also grown. Maréchal Niel is said to be useless for winter-flowering. I especially noticed the bright, clean, healthy foliage, which had not a spot of dirt upon it. I also saw a lot of brown stringy-looking stuff covering the floor of the houses, with the exception of the paths, and on inquiring, I found these two things had a very close connection, the brown-looking material being the refuse from tobacco works, and consisted of the midribs of the leaves, &c.; this is damped occasionally with water, and keeps the air charged to a certain extent with nicotine; it lasts in condition about two months, and is then renewed, and is sometimes placed upon the pipes, as well as the floor of the houses; the smell of it is peculiar, and rather unpleasant, but probably one soon gets used to it. I was assured it kept the plants clear of greenfly, &c., without any trouble of fumigating and its attendant evils, and only costs a nominal price, and a short time since it could be obtained for nothing. Will not some kind M.P. who is interested in horticulture introduce a short Bill to our Government, in order that this material might be landed here duty free, when used solely for insecticidal purposes; such a measure would be an inestimable boon to our gardeners in the cultivation of fruit and flowers, tobacco in some form or other being one of the best insecticides known, but owing to the heavy duty it is practically impossible to use it as largely as is desirable.

Another thing I noticed, which our nurserymen and large growers would do well to copy, is stencilled labels; they are machine made, and are then stamped in nice clear type by the men as overtime work. They last two years in the houses, but not so long when exposed to the weather, and are far better in appearance and quicker to read than if written with a pencil. The gardeners at nurseries get about 8 dol. a week, which is equivalent to 33s. 4d., with house, &c., and do not work so hard as English gardeners do. Food and clothing are, however, much dearer in the States, and really good clothes almost unobtainable. The public walk round the nurseries and through the houses quite unaccompanied; the manager said they had not time to show people round. The soil here is a light loam. The new Chrysanthemum, Louis Boelmer, in flower at the time of my visit, has hairy petals like those of Mrs. Alpheus Hardy, but the colour is a soft rose. A large stock of the latter was noticed, but most of the Chrysanthemum flowers were cut. Scutellaria pulchella, plants of which were flowering freely, is considered a useful winter-flowering plant; it has red flowers, and grows to a height of 24 inches; but it also flowers well in a smaller state. A quantity of Cocoloba platyclada looked very curious, with its flat articulated stems and small leaves.

CENTRAL PARK.

My next visit of any horticultural interest was to the Central Park, of which an illustration appeared in the *Gardeners' Chronicle*, August 31, 1889; this is very pretty, as it is beautifully undulated, and has a number of rocks appearing above the turf in a natural manner. On inquiring of one of the men if the park was artificially made, he said, "No, sir; it grew so." Unfortunately, the Superintendent resides a long way from town, and I was unable to see him. The water scenery is very good, but much of its beauty is spoiled through placing so much carved stonework and asphalt in the foreground, at the principal point of view. The park is exceedingly well kept, the grass even then

was beautifully fresh and green, and they were giving it heavy dressings of farmyard manure in some parts, which possibly accounts in some measure for the clean healthy growth of the trees, some specimens of *Salisburia adiantifolia* had made shoots 4 feet long last summer, but the deciduous trees were of course leafless when I was there. Some of the species of *Crataegus* were very pretty, with berries of a much brighter red than we see them in England, a variety or species of *Symphoricarpos*, probably vulgaris, was very telling, with its long branches of dark red fruit. It ought to be hardy here, but I do not remember having seen it before. *Forsythia suspensa* appeared quite at home, and had made very strong, healthy growth as bushes. *Lonicera japonica* looked very pretty, trailing in a natural manner over some rocks. This park is about 900 acres in extent, and evidently well patronised by the public, who find in it every convenience.

ORCHIDS, ETC.

On enquiring if Orchids were grown in the neighbourhood, I was directed to Messrs. Pitcher & Manda's establishment, at Short Hills, New Jersey, about an hour's ride from New York, where a very interesting collection is grown, the plants looking remarkably clean and healthy, although I was told the nursery was quite new, the houses having been built about a year before. The *Cypripediums* seem to be especial favourites, and some varieties were represented by very large numbers. I noticed in flower *C. maruorophyllum*, *C. callosum superbum*, *C. calurum Rogerii*, *C. Spicerianum*, *C. tessellatum porphyreum*, *C. Boxalli*, *C. Masereelli*, the latter an especially choice variety, for a small plant of which the firm gave £200. *Phalaenopsis amabilis*, *Laelia Gouldiana*, *L. autumnalis*, and *Cymbidium Masterianum* var. *alba* were also flowering well. The manager said that seedling Orchids grow much quicker than in Europe, and he showed me a large quantity in various stages of growth, one of which — a *Cypripedium* — was showing flower, although it was only a little more than twelve months old. They had a number of good foliage plants of the stove, amongst them being *Hoffmannia Ghiesbreghtii*, noted for its variously coloured leaves, and a fine batch of the handsome and useful *Pandanus Veitchii*. *Chrysanthemum* flowers were almost over, but *C. Kioto*, a broad petalled Japanese variety, *Medusa*, with white thread-like petals, and *Lilian B. Bird*, were worthy of notice. A nice lot of *Chrysanthemums* in seed was progressing favourably, and raising seedling Orchids and *Chrysanthemums* appears to be much easier in America than in Europe.

NEW YORK MARKET.

However much the Americans have improved on our plans in some things, they have not made much advance in this, although it is not perhaps quite so crowded as Covent Garden. A large open space not far from the docks is divided lengthwise into spaces about 30 feet wide, by 5 feet pathways, the latter being paved with smooth slabs, and the other part with some pitching. The larger spaces hold four rows of vans, with room in the centre to get out and in, and the buyers walk down the pathways or drive round among the vehicles as best they can, and make their purchases. Some of the vans were piled up with hard white heads of Drumhead Cabbages, which were selling at 1d. to 1½d. each; these seem to be the only kind of Cabbage they grow for market. I found when I got to Florida they were sent down there from New York, and sold at 2½d. per lb. Celery was very small and poor, and selling at 3d. per dozen heads; I did not see any good enough for an English market. There were also Turnips, Carrots, Beet, and herbs. Near this place are square blocks of buildings where fruit and vegetables in barrels and boxes are sold; these shops have a verandah in most instances which extends about 12 feet over the pathway, and specimens of the goods for sale are stood out on the pavement, leaving an opening up the centre for the public to walk. I was much amused to find that Swede Turnips have a ready sale at New York at 4s. 2d. per barrel. Potatoes

of the Early Rose class were fetching 8s. 4d. per barrel; very small Onions 9s. 5d. to 12s. 6d. Apples of various kinds were very fine in appearance, and making about 11s. 5d. per barrel; the sorts consisted chiefly of Greenings, Spitzenburg, Russets, and King of Tomkin's County, the latter being very fine in appearance. Florida Oranges were 8s. 4d. per box, but they were not ripe. I noticed an excellent plan for protecting things exposed in these barrels for sale from the fingers of the public. This is managed with domes of wire-work made to fit the tops of the barrels [Also in London, Eng.], so as to allow the fruit, &c., full exposure to the eye of passing pedestrians. New York is a busy place. It is also one of the dirtiest towns I ever saw. I suppose this is only another verification of the old Yorkshire saying, "Where there's muck there's money." There are a few good florists and fruiterers shops in the better part of the city, some of which were well supplied with goods, and do a large trade; but on the whole, New York has nothing like the supply of London in the way of market garden produce. Even in the third week of February, it was almost impossible to get Asparagus, and the vegetable market at that date had very little besides Drumhead Cabbage, Potatoes, Onions, and Swede Turnips. *W. H. Divers, Ketton Hall, Stamford.*
(To be continued.)

ABIES BRACTEATA.

We are now enabled, thanks to the courtesy of Mr. Coleman, of Eastover Castle Gardens, to give a representation of this very distinct and very beautiful Silver Fir in two stages, and thus to supplement our account of the cone and foliage also taken from specimens furnished by Mr. Coleman, in the number for February 23, 1889. When the dry parchment-like scales of the hitherto sharply pointed buds fall off, the growing shoot thrusts itself forward in the shape of a dense tuft of green leaves, as shown in Mr. Smith's drawing. The male flowers, which up to this time have not been described or figured in books, are of a pale lemon-yellow, and as it is desirable to place their characteristics on record, we add the following description:—

Male flowers solitary axillary produced from the sides of last year's shoots near the base, each 30 to 40 mm. long, 5 to 7 mm. lat., slender cylindrical, shortly stipitate, surrounded at the base by numerous imbricating navicular, lanceolate, fawn-coloured, parchment-like scales, increasing in size from below upwards, similar to the perule of the leaf bud. Anthers stipitate, pale lemon-yellow, dehiscing transversely, and with a blunt knob projecting from the middle of the dorsal surface. Sometimes, as in the author figured, there are two such knobs.

The tree is one of the handsomest of its race, alike in foliage and in cone. It is a native of Southern California, and is tender in some parts, though we can speak for its hardihood in East Kent.

NEW OR NOTEWORTHY PLANTS.

BULBOPHYLLUM LEMNISCATOIDES.

Rolle, n. sp.

Bulbophyllum lemniscatum, Parish, is a very remarkable little plant, which was discovered in Monks-in by the Rev. C. Parish, and of which an excellent figure may be found in the *Botanical Magazine*, t. 5961. Its great peculiarity is the presence of three long appendages, one from the back of

* *Bulbophyllum lemniscatum*, Rolle, n. sp.—The pseudobulbs are crowded, ovoid, ½ inch high, bearing one, linear-lanceolate, subacute leaf, about 3½ inches long. Scape suberect, at least 6 inches high, with two light brown, sheathing, lanceolate, acute bracts, one above the middle, the other nearer the base. Flowering bracts lanceolate, acute, light brown, pilose near the apex. Sepals broadly elliptical-oblong, obtuse, very dark purple, with numerous white elliptical hairs, appendages situated on the back of each sepal just below the apex, and five times their length, papillose, light flesh-purple. Petals linear-lanceolate, serrulate to near the base, ½ inch long. Lip very fleshy smooth intense dark purple, elliptical-oblong, obtuse, equalling the petals. Column stout, with a pair of stout, acute teeth, another each minutely papillose.

each sepal near the apex, which hang pendulous underneath the flower, and which are supposed to have some connection with its fertilisation. No other species was known which could possibly be confounded with it, if indeed any could be said to present analogous features. The other day a remarkably similar plant was sent to Kew by Mynheer Van Lansberge, Château de Rees, Brummen Gueldre, Holland, and which had been imported direct from Java. The flowers, and indeed the whole inflorescence, are so remarkably similar that at first I thought they belonged to the first-named species; but on careful examination numerous important differences came to light, and now that a drawing of

WATERING.

As the time of year is at hand when outdoor waterings of plants must be resorted to, a few remarks upon the subject may not be out of place; for we venture to think that the matter, important as it is, does not receive the amount of attention that it deserves.

We all know that water is essential for the activity of all living agents, whether of animal or vegetable; and we find that the oxidation and nitrification of plant-food is far more rapid and effectual in a moist soil than in a dry one. At the same time, it must be remembered that an excess of water is fatal to

better regulated and controlled), than in the open garden.

We learn from these facts that artificial waterings of plants, to be most effective, should be copious, and sufficiently abundant to moisten the soil throughout down to the roots; and that the operation is rendered more efficient if a deep stirring of the soil is afterwards given with the hand-hoe. The latter process neutralises the surface-caking, and allows of a free circulation of air, and at the same time assists to retain the water within the soil.

In reference to the same subject, it may be stated that while the evaporation per single plant of a crop thickly planted is greater than for one of a crop planted closely, the total evaporation from thickly planted crops is vastly greater than from those thinly planted. Hence, in time of drought and hot weather, the former is likely to suffer first and most.

On the other hand, when rains are excessive, the reverse may be the case; the thickly planted crop under those conditions may do best, because the large evaporation by the crop tends to keep the soil from being over-saturated with water, and so from being deprived of air and the work of oxidation.

The importance of soft-water for artificial waterings is recognised by every successful and intelligent gardener. Rain and pond-waters are decidedly preferable to spring or well-water, for besides being softer, they contain more manurial qualities.

Spring water may, however, be softened by exposure in a tub or tank to the sun's rays for twenty-four hours previous to using, or a small quantity of slacked lime may be stirred in and allowed to settle.

Soapsuds from the kitchen should be saved, and used for artificial waterings, because the alkaline salts of potash and soda used in the manufacture of the soap are valuable as manure, especially to fruit trees, and the clear liquid may be employed with great advantage for syringing. *J. J. Willis, Harpenden, Herts.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT THE BRIARS, REIGATE.

The collection of Orchids at this place is now of considerable extent, the proprietor, W. L. Barclay, Esq., an enthusiast and a liberal patron of horticulture generally, having exercised much judgment in selection during several years past. He is President of the Reigate Chrysanthemum Society, but in his own gardens, however, Orchids would seem to be his favourite plants, and a more or less interesting display is generally to be found at The Briars; and owing to Mr. Bailey's skill as a cultivator, many of the specimens are more than usually good. Prominent among those flowering at the present time were noticed some examples of *Odontoglossum Hallii*, with very large and distinctly marked flowers; many excellent varieties of the popular *O. crispum* and *O. Pescatorei*, and on several plants of the latter the flowers were of great substance and pure colour; *O. ramosissimum*, with its much branched panicles of white and purplish-lilac spotted flowers, was rather effective. The fragrant *O. laeve* (*Reichenheimii*) and *O. gloriosum* were flowering in profusion. There is a fine mass of *Mesospidium vulcanicum*, with its rosy racemes; *Oncidium cucullatum*, largely represented, was showing a great range of variation in point of quality—and although all were equally well grown, yet some had flowers nearly twice as large as others. *O. concolor* looked particularly happy in its elevated position, as did also *O. bifolium majus* and the delicious *O. pratense*. Several plants of *O. macranthum* were doing finely, and showing great promise; some of them, as on former occasions, have run out an inflorescence more than 15 feet in length, and may grow still further; *Oncidium carthagenense* was also flowering well.

Cattleyas consist of *Mossie*, *Trianae*, *Mendellii*, *gigas*, *crispa*, *Acklandiae*, and *Schilleriana*; and these, with *Laelia elegans alba*, were found in good form. A good potful of the new *Phaius Hum-*

FIG. 112.—APIES BRACTEATA, SHOWING MALE FLOWER, ANTHERS, POLLEN, AND EXPANDING SHOOT. (SEE P. 672.)

the plant has been sent, it is clear that we have a very distinct species to deal with.

In addition to the diverse habit, the totally different structure of the sepaline appendages is especially noticeable. In the older species these consist of ten longitudinal crested plates radiating from a common centre, but in the present one they are terete and simply papillose. *R. A. Rolfe.*

ROSE THE QUEEN.—Messrs. W. PAUL & SON ask us to state that they were awarded a Horticultural Certificate for this white Tea-scented Rose at the last exhibition of the Royal Botanic Society on the 14th inst. This is a pretty flower—a pure white sport from *Souvenir d'un Ami*, and does not appear to differ essentially from the sport shown by Mr. G. Prince, of Oxford, as *Souvenir de S. A. Prince*.

the development of plant-food, air being naturally excluded as soon as the soil is filled with water. One essential condition, therefore, for healthy plant-growth is a perfectly aerated soil; porosity in a soil always tends to the oxidation of organic nitrogen, converting the insoluble and latent substances into soluble and easily assimilable food.

Temperature is another prime factor in determining the rate of oxidation and nitrification in soils, the activity of all bacteria, or nitrifying organisms, being dependent on the occurrence of a favourable degree of heat, as well as of moisture; and further, it is found to be confined to certain specific ranges of temperature. Hence we find plant-growth far more rapid in summer than in winter, and much more energetic in a conservatory or greenhouse, (where the degrees of warmth and moisture can be

blotii, healthy and vigorous, was just coming into flower. The old *Calanthe veratrifolia*, with its white spikes of flowers, was noted in quantity; it is a plant which still holds its own. *Dendrobiums* are well represented, but most of these plants had flowered; still there were some plants of *D. Devonianum*, which were in great beauty, the slender pendent pseudobulbs being clothed with the delicately formed, prettily marked flowers, the fringing of which gives them so charming an appearance. *D. Freemannii*, the deep coloured form of *D. lituratum*, had several pseudobulbs well-flowered; as also was the old light-coloured *D. Picardii*. The popular genus of the day—*Cypripedium*—was well represented: *concolor*, *bellatulum*, *caudatum*, *Lawrenceanum*, *barbatum*, *nigrum*, being species that were conspicuous; *Miltonia vexillaria*, some with forty to fifty racemes in a pot, was a fine sight. The distinct and showy true *Epidendrum vitellinum majus*, is well-grown and flowered. *Vanda Sandieriana* seemed to be well-established here, and *V. teres* was flowering freely. An old, but rather refractory subject, in the shape of *Lycaste jugosa* (*Colax jugosus*), was flowering freely, and seemed happier than I remember to have observed in other gardens. It may be noted that the house in which it was growing was light and airy, conditions which this mountaineer evidently enjoyed. In the same house were the *Masdevallias*, and it evidently suited them also. One sometimes sees these plants with flower-scapes so weak that they can scarcely carry the weight of the flowers, whereas here the scapes were stout, and consequently quite erect. Fine examples were observed of *Liadani*, and the variety *Haryana-Veitchiana* with immense flowers; and neat, but well-flowered masses of *M. Sautletworthii* and *M. triangularis*, also *M. amabilis* and *M. ignea*. The collection has much improved since Mr. Bailey undertook its management. *F. R.*

MRS. STUDD'S ORCHIDS.

Steadily increasing in importance, the collection of Mrs. Studd, Royal Crescent, Bath, will now rank with the leading collections of the West. Quality rather than quantity has been the maxim of the owner, hence the preponderance of fine species and varieties. The effect of this carefulness of selection is noticeable at the present time in the superb forms of *Cattleya Mendelii*, *C. Lawrenceana*, and *Laelia purpurata*, with which the large *Cattleya*-house is embellished, among which almost every plant in flower is of more than average merit, while *Laelia purpurata* *Studdii* and *L. p. superba* appear to have attained the highest point of excellence; many of the specimens, too, are of a very large size, one piece of *Cattleya Mendelii*, for example, having twelve flower-sheaths, and specimens of *C. gigas*, *C. Dowiana*, and *C. aurea*, which were suspended overhead, were furnished with flowering growths so profusely as to warrant the expectation of a great display of its gorgeous flowers in due season. Mr. Geo. Cypher, the gardener, who is an apt acquirer of a plant-growing family, and particularly successful with these plants, remarked that the plants of *C. gigas* and *C. Dowiana* sections, flower better when not overpotted, and when kept rather dry from the present time until the flower-spikes are well advanced. *Cattleya Lawrenceana superba* was grand, and *C. Skinneri*, a fine mass of beautiful flowers; but perhaps the most charming plant of the collection was a novelty of the macrantha section of *Sobralia*, with large flowers, the sepals bluish-white, the petals lavender, and the large labellum of a clear yellow colour at the base, the throat white, and the broadly-expanded front lobe of pale lavender-blue,—the perfection of a beautiful and delicately-tinted flower. In the same range of houses were *Cattleya Schilleriana*, *Burlingtonia fragrans*, *Cymbidium Lowianum*, and a number of *Odontoglossum citreum* in great beauty.

In the *Cypripedium* division, several specimens of *C. superbiens*, *C. ciliolare*, and *C. Curtisii*, were in bloom, also larger specimens of *C. Lawrenceanum*, *C.*

Dayanum, *C. caudatum*, and various forms of *C. barbatum*.

The *Dendrobies* are grown to great perfection here, and a plant of *D. Ainsworthii* may be cited as an example which bore 230 flowers last year, and bids fair to have this year still more flowers. *D. Phalenopsis* and species of the bigibulum section were doing remarkably well in baskets suspended near the glass, in a light situation in a warm division. Some beautiful forms of *D. nobile* were in flower; and small plants of that rather restive subject, *D. MacCarthei*, had as many as sixteen of their curious large flowers with the slipper-shaped labellums. The small rare *D. mesochlorum*, and the new and handsome *D. atroviolaceum* were also in bloom, and *D. suavisimum* bore twelve spikes.

In the same corner of the house in which some *Phalenopsis* were growing thriftily, stood *Zygopetalum rostratum*, a species that is not in general successfully grown. It was in vigorous health, and growing with it were *Phaius tuberculatus*, *P. Humboldtii*, both well in flower, and other plants requiring similar treatment to these. An instance of remarkable success in plant growing was a specimen of *Thunia Marshalliana*, with very stout stems clad with leaves nine inches in length. The Bamboo-like character of this plant, when well grown, renders it highly ornamental, even when not in flower. Among out-of-the-way plants, a healthy collection of those interesting plants, the *Catasetums*, *Aerides expansum*, *Leonia Gongora maculata*, *Vanda Hookeri*, &c., was remarked. The cool houses held a good show of *Miltonia vexillaria*, *Odontoglossums*, *Masdevallias*, *Lycastes*, *Epidendrum vitellinum*, and *Oncidium lamelligerum*, and *O. macrauratum*. The *Orchid* houses are away from the dwelling-house, and the plants in bloom are kept in their various houses, but a temperate and a cool conservatory adjoin the residence, and contain Palms and Ferns, and are always kept gay with the flowers of the season, but not *Orchids*.

TREES AND SHRUBS.

THE VARIEGATED SYCAMORE.

The form of *Acer pseudo-platanus* known as *flavo variegata* is an effective tree during the spring months, especially if planted on the lawn, or in other parts where the grass is not so neatly kept as there. The green and yellow markings of the leaves show best when the tree is backed up with dark-coloured evergreen foliage. The growth of the tree is quick in almost any kind of soil, and its habit is more erect than spreading. *E. M.*

SPIRÆA PRUNIFOLIA, 1L. FL.

This double-flowered *Spiræa* is one of the best of the genus as a plant for the shrubbery border. The growth is semi-drooping, the flowers white, are freely produced along the top of the shoots, and by the manner in which they grow they are readily seen. Planted in clumps of three or four, in a sunny spot, is the way to grow and see this *Spiræa* the best. *E. M.*

RUBUS DELICIOSUS.

This should find a home in every garden; it is a non-spiny *Rubus*, with growth and leaves resembling those of a Currant, and bearing numerous large white flowers, something after the manner of *Clematis montana*. It thrives in these gardens freely on a wall with an easterly aspect. After flowering, the growths required for covering its allotted space should be laid in, and the superfluous cut away, leaving the young growths free; and in this way the plant presents a most pleasing effect when in flower. *W. Harrou, Botanic Gardens, Cambridge.*

DRYAS WINTERI.

This plant will stand out in some localities, and may also be turned to good account for decorative purposes. By the use of the pruning-knife, good bushy specimens may be obtained, without any

apparent injurious effect to the plant. It belongs to the *Magnolia* family, and grows to a height of 25 feet. It was introduced from South America in 1827. The flowers are of creamy-white, scented, and compare with those of the *Jessamine*; they measure from 1 inch to 1½ inch in diameter, and are produced at the ends of the branches in profusion. The leaves in shape resemble those of the *Rhododendron*, being light green above and glaucous below. The same treatment afforded *Choisya ternata* suits it also. *W. H.*

FLORISTS' FLOWERS.

THE AURICULA.

The advocates of the early potting of *Auriculas* have a great amount of common sense on their side. The *Auricula* becomes active in February, and accordingly as the weather is favourable or otherwise, it develops, makes bare its trusses of bloom, and expands the pips. It develops offsets on such plants as are strong enough to do so, and then takes its midsummer rest. The *Auricula* may be said to have two periods of rest, very opposite in themselves—midwinter and midsummer. As the summer wanes, the second period of activity sets in, which continues until autumn is reached, and then the plants gently fall away to their winter rest, as the Rev. F. D. Hornor puts it. The appearance of the plant, indeed, at each is very different, but its condition is much the same—one of rest. In December, its apparent quietude is but the preparation for the display of spring; and though scarcely a movement is perceptible in the few short stout leaves that are left, and that form its winter covering, it is busy within forming leaves and flower-buds, just as the *Tulip* bulb also, in its time of rest, invisible to us, is making a like preparation.

I like to report my young unbloomed stock of *Auriculas* early in April; they catch the flowing tide of *Auricula* fervour, and during May make free and vigorous growth, becoming fine plants by the end of the summer. The blooming plants cannot well be repotted until the flowers have begun to fade; and such plants as it may be deemed desirable to take seed from, are best left in their pits until the seed is ripe. The most critical time for the plants, and when they often go rapidly back, comes in the interval between blooming and re-potting. August used formerly to be regarded as the best time to re-pot, and if the plants are left in exhausted or sour soil until then, or if they are not closely looked after during midsummer, they deteriorate at a great pace, and we have found that the downward course is a more rapid one than the upward. It is easy to see that there was a positive advantage in top-dressing in the case of plants not to be repotted until August; it was a kind of foretaste of a complete re-potting to follow later, and it furnished the plants with some surface soil in which to root, as in the spring the plants put forth the roots immediately below the bottom leaves, and just above the soil. It is invaluable to the plants to have some sweet and invigorating soil for their new roots to work into. Even for out-of-door plants a little compost tacked under the leaves in April does much good, and is equal to sinking the plants. Soon after midsummer the *Auricula* again becomes active, but its growth is not so stirring as in the spring. Happy are they who have re-potted in time to benefit by this awakening. Plants not re-potted put on this growth, but they do not appear to answer to it with the zest they do if the roots are in fresh soil. While yet waiting re-potting, the soil dries quickly because so full of roots, and exhausted. In warm weather *Auriculas* require water almost daily if in a dry position, while those which have been re-potted will go for several days without much harm, though it is risky to let them become dust-dry at that period of the year. Unpotted plants seem to be more liable to be infested by insects than those in clean pots and fresh soil. At the same time, newly potted plants need to be

closely looked after, as aphides soon make headway if allowed to gather on the under sides of the leaves. The Auricula is a plant that never requires much water. My plants are in a north house, and get some sun during early morning and late in the afternoon, and they frequently go for a week or more without being watered. The drainage of Auricula pots should be perfect, so that the water will pass away freely, and if it should remain on the surface, there is defective drainage.

I have mentioned the potting of young stock. I give only a shift, so that the pots may soon be filled with roots. About the end of August I give another shift. It is true the plants make but little growth afterwards, but the roots are active, and the plants are well established by the time of their winter's rest.

YELLOW FORMS OF AURICULAS: SELFS.

Golden and yellow forms of the Auricula are not uncommon, as is seen in the case of the fancy Auriculas shown last week by Messrs. Douglas and Barlow. Some of Mr. Dodwell's flowers were very novel and singularly handsome. The term fancy, as applied to the Auricula, is a convenient and elastic rather than a definite and arbitrary one; and under it can be comprehended any variations not in the sections acknowledged in schedules of prizes. Many seedlings of this character are too good to be thrown away, and they can only be exhibited as fancies.

The blue self appears to be the highest in point of value; at the present time, Barlow's Mrs. Potts may be said to head the list. It was more numerous than any other self on April 22, which says much for its constancy of character. Next come the purple and dark selfs, of which Heroine and Black Bess are such conspicuous types; the latter is a very fine dark flower, making a first-class exhibition variety, and, like Black Bess, was much shown recently. Next comes the red selfs, of which we have very few, Mand and Lord of Lorne still being the best. Mr. Horner has a very fine red self, named Firefly, which, if it is to be hoped, will be distributed in due course, it still maintains its reputation. Lord of Lorne is a striking flower when well grown, though it has the defects of a weak paste and notched segments. But its bright colour always causes it to tell well in a stand. Duke of Argyll, by the same raiser, is scarcely ever—or I might say never—seen now.

Lowest of all in point of rank come the yellows. Strange to say, however beautiful a yellow self may be, an exhibitor would regard its presence in a collection as weakening rather than strengthening it. Does not this partake of a kind of old world prejudice it would be well to get rid of. I shall, doubtless, be thought proclaiming a rank floricultural heresy, but I say it because I think the yellow self should have a place on the exhibition table as well as any other colour in the section. It has been said the yellow selfs can be shown among the fancies. Precisely so, if they are only second-rate; if they are first-rate, let them be considered as of the same value as selfs of any other colour. R. D.

PLANT NOTES.

NICOTIANA AFFINIS.

This is a charming tender perennial, which will grow in a greenhouse in winter, but to have the full beauty it should be kept gently moving. When planted in '92's and '91's it makes fine plants that are of decorative value in the spring, throwing out numbers of flower spikes from the upper part of its branching stems to the height of 5 feet. The flowers come in succession. It is usual to raise a stock of it from seeds, but a good pure white variety being secured, cuttings of the side shoots and of the roots may be employed for the purpose. The soil best suited for the plant is loam, exhausted mushroom bed materials, and a little sand; and the plant should be grown in a pit and near to the

glass, at least, during the winter, and in a temperature of 55°. Here they make dwarf sturdy plants, and well repay the little trouble bestowed on them. A. Evans.

CALLAS, OR RICHARDIA.

Although some gardeners advocate the plants to be kept in pots during the summer months, it is a practice that is not likely to become general, as planting out means less labour and equally good results. I divide the old stools before putting them out on fairly well enriched soil, planting them firmly at 2 feet apart, and supporting the leaves with strong stakes. The old flower-spikes are cut away, and, if left on, they not unfrequently seed at the expense of the plant. A basin-like depression should be made round each plant to hold water.

SANTBERGA COMPOSIT.

This species of Saxifrage, sometimes known as S. Wallacei, is a first-rate plant for the front of the herbaceous border, if allowed to grow into tufts about 1 foot across; or on the rockery, where it makes a brave show at this time of the year. The flowers, about two-thirds of an inch in diameter, are produced abundantly, and it is one of the easiest of the whole genus to increase and grow, which it does not do more than 6 inches in height.

ANTHERICUM LILIAGO.

The St. Bernard's Lily is a charming spring-flowering hardy plant, well suited for planting in the mixed border, or on the rockery, where root-space is ample. In such places, the plant throws up numerous flower-spikes 1 to 2 feet high; the individual blossoms are pure white, and the points of the petals recurve. It flourishes in a light sandy soil, but objects to a cold, heavy, or wet soil, and usually suffers in such during the winter. E. M.

RONDELETTA GRACISSIMA.

Of the various species which have been introduced, perhaps those which have at one time or other been designated Reginas are certainly showiest, and as they come from a rather cool region, they are more at home in the cool greenhouse than in the stove, where the West Indian Rondeletia are usually grown. R. gracissima, however, is quite at home in a house where the temperature never falls below the freezing-point, and is in no wise particular as to soil; but a good friable loam is best, and the position should be light and airy, and abundance of water being afforded the plant when growing, which it nearly always is more or less, as no sooner have the flowers faded than it begins to push new growth, and any cutting back that may be needed should be done at that time. The flowers are of a pinkish colour, agreeably scented, and produced in dense terminal and axillary corymbs which are sometimes 6 inches across; at all events, when planted out in a good rich bed of soil, they attain such dimensions. Although it is a plant well suited for planting in a winter garden or conservatory, it is quite amenable to pot culture. The flowers are useful for cutting, indeed, they are rather choice in that respect.

FUCHSIA ABROSCENSIS.

In general appearance, the inflorescence is not unlike a huge bunch of Lilac; in fact, the plant has been figured in the *Revue Horticole* under the name of F. sringedora. Its nearest ally is probably F. ovalis, but in that species the peduncles are axillary, and the plant pubescent; whereas, in F. abroscensis the flowers are borne in large, terminal, trichotomously-divided panicles, and are produced in early summer from the growth of the previous year. Any pruner which the plant may require should be done as soon as the flowering season is passed, in order that a good growth may be developed before winter sets in. The species thus differs from the florist varieties of Fuchsia, inasmuch as it cannot, like them, be ripened and stored away for a few months, under which treatment it might survive, but would not be likely to flower. It is really an

evergreen, attaining the dimensions of a small tree and is a capital thing for planting out in a large glass-house. It may be kept cut back to a given height, but it should not have less than 10 or 12 feet of space to itself, if it is to be seen in its true character. It is easily propagated by cuttings, and succeeds in any ordinary garden soil. F. R.

ANEMONE NEMOROSA, FLORE PLENO.

This is a good plant for a sunny part of the rockery, and makes a show at the end of April or early in May. When once established in a loamy soil, mixed with lime rubble sufficient to keep the soil porous, it quickly spreads, and forms a dense clump, which never fails to flower freely each year. We have it growing beside the blue A. appennina, which is a beautiful rock plant; and by the time that that species is past flowering, the white-flowered species under notice commences to bloom. Division of the roots or tubers any time after the foliage has ripened off is the means of increasing the stock. We do not practise lifting the roots annually, and they succeed very well.

ARENARIA BALEARICA.

This Sandwort is a gem for covering the stones in the rockery, especially those which are moist and sandy; upon such it grows the fastest, forming a dense covering of close growth, thickly studded with the minute white flowers during April and May. At the end of the summer, when the weather is dry, the leaves of the plant appear to shrivel up as if the plant were dead, but with a return of moist weather the growth again springs forth as in early spring. Where a rockery, large or small, is in existence, a portion of it should be covered with this Sandwort. E. M.

NATURAL CONDITIONS & CULTURE: PLEIONES.

Mr. GAMMIE, in his interesting communication on p. 516 ("Orchids in Sikkin"), refers to a portion of a chapter on Pleiones written by me, and editorially quoted in the *Gardener's Chronicle* a little while ago. As Mr. Gammie complains that the words quoted were not sufficiently explicit to prevent misunderstanding as regards the cultural requirements, and error as to the geographical position of Pleiones, perhaps I may be allowed to explain, as I do not wish to be suspected of carelessness in matters of this kind.

The quotation commented upon was from the introductory remarks on the genus Pleione as a whole. Permit me to make the following extracts from the chapter as it appears in *Orchids*.—

"All the Pleiones are natives of the mountains in India. . . . Two of them are wild in regions where snow and frost sometimes occur. They are found often in great abundance, clothing the trunks of trees, and clinging to moist rocks, in positions exposed to full sunlight.

"Culture. . . . Many fail with them through giving them tropical treatment and excessive coddling. . . . The plants after potting are placed in a cool house, and not watered until the leaves are well developed, and the new roots have penetrated well into the soil. About the beginning of April they are placed in an intermediate temperature, close to the roof, in a light moist house. . . . When the leaves are mature, the plants are again placed in a cool house."

Under the species described, the following information is given:—

P. *Hookeriana*.— . . . Requires constant cool treatment. . . . Found wild at an elevation of 8000 to 10,000 feet on the Sikkin Himalayas. . . . where in the cold season the temperature falls many degrees below freezing point. It should be grown close to the roof in a cool moist house.

P. *kuwaitis*. . . . This species is found in Nepal, at an elevation of 7000 feet.

P. *lagenaria*. . . . We have seen pans 10 inches across, containing plants of this species, bearing over eighty flowers expanded at one time. . . . Himalayas,

where it is common on trees and rocks at high elevations.

P. maculata . . . This is found at lower elevations, consequently it requires a little more warmth than the others. It should be grown in an intermediate temperature, although under the treatment recommended for *Pleiones* generally it makes large bulbs and flowers fairly well.

P. proctori . . . scarcely different from *P. lagenaria*, except in the colour of the flowers.

Mr. Gammie, is of course, in a better position than I am to test the accuracy of all that is said in the above as to the natural habitats of the *Pleiones* described. The figures given agree with those in Sir Joseph Hooker's recently published monograph of the Indian Orchids [in the *Flora of British India*.] But whether these *Pleiones* grow on wet or dry rocks, in the lowlands or on the highlands of India, I am absolutely certain that the cultural directions given for them are reliable, as they are from actual experience.

With respect to temperature as an important factor in the distribution of plants, it has to be borne in mind that it is not the only one. A plant may be prevented from extending higher or lower, as the case may be, by other obstacles than heat or cold. The behaviour of hosts of plants under cultivation proves that such must be the case. I will mention only two: Mr. Burbidge found *Nepenthes Rajah* at so high an elevation that he recommended cool treatment for it; under cultivation it is perfectly happy in a tropical house with the rest of the *Nepenthes*. *Zephyranthes candida*, found in the hot Valley of Lima, but perfectly hardy at Kew, is the only hardy species in fact, although the others come from high altitudes. Herbert noticed this peculiarity in this *Zephyranthes*, and makes the following comment upon it: "There is, however, a mystery in the constitution of plants, which does not always depend upon their native climate." (*Amaryllidaceae*, p. 177.)

Mr. Gammie's remarks on *Cymbidium eburneum* appear to me to clearly indicate that this plant requires tropical treatment. At Kew it is grown and flowered in the same house as *Lycaste Skinneri*, in fact it is now, I believe, invariably grown in a greenhouse rather than in a stove temperature. If placed in the same house with *Dendrobium fimbriatum* and *D. aureum*, its leaves soon become spotted, and the plant is a failure. Indian botanists and travellers frequently express surprise and astonishment on seeing the temperatures in which some plants thrive when under cultivation in England. *H. Watson, Kew.*

SUNDIALS.

IMAGINE a blessed time when Time was not; when light and darkness formed the only measurement of recurring but uncounted days; when business engagements were impossible, punctuality a word unknown; when hunger sounded the dinner-bell, drowsiness rang the curfew; when Jaques' Fool could not have "moralled" in the Forest, nor King Henry VI. have soliloquised on Towton field; when Southey could not have cursed the Balliol chapel bell, nor Mr. Peter Magnus' signature have "amused his friends very much." The gods confound the man, says *Plautus*,

"The gods confound the man who first found out
How to distinguish hours;—confound him, too,
Who in this place set up a sundial,
To cut and hack my days so wretchedly
Into small pieces. When I was a boy,
My belly told me when 'twas proper time
To go to dinner,—when I had ought to eat;—
But now-a-days, why even when I have,
I can't fall to, unless the sun gives leave."

The first historical allusion—so say the learned—was some Chaldean shepherd ranging trackless fields, who being, what *David Copperfield* called his rival at the pic-nic, "an ingenious beast," erected his staff in the ground, and marked by stones or indentations the progressive shadows of the Sun-day, primal rudiments of the hour. To later sages it was revealed that a staff inclining to the pole-star

afforded more permanent measurement; and there for centuries invention paused, till the mathematical astronomy of after days took in hand the rude device, regenerating it into an instrument of precision, portable or fixed, horizontal or vertical, reflective or refractive.

The earliest on record is the sundial of Ahaz, obtained by him doubtless from Assyria, about 714 B.C. It appears to have been an obelisk, approached by steps or "degrees," down which the shadows would creep as the sun sank. A partial eclipse, obscuring the upper hemisphere of the sun a little before midday, would cause the shadows to descend the steps, perceptibly to a scientific observer, retiring up or "going backwards" as the obscuration passed off; and it has been ascertained that such an eclipse did take place in the year of Hezekiah's illness. Our next historical or quasi-historical sundials appear in Greece, nearly 200 years later, introduced by Anaximander of Miletus. The Greek numerals are represented by the letters of the alphabet; and the characters which express the hours from noon till 4 o'clock spell, curiously enough, the word *ἔσθι*, "live." An epigram by *Lucian* crystallises the lesson—

"Six hours to toil, the rest to leisure give,
In them—so say the dial's hours—live."

Three centuries more elapsed before the art was known to the Romans; for though a sundial from a Greek town in Sicily was set up in the Forum about 263 B.C., yet not having been calculated for the latitude of Rome, it told the time inaccurately during a hundred years. The early Christians ascribed to devils and magic a splendid dial erected in Byzantium by Apollonius of Tyana. A brazen eagle, elevated on a lofty column, grasped a struggling serpent in his talons; the divisions of the day were inscribed upon his wings, and the noon was formed by his erected head and beak. The dials of our Teutonic forefathers survive, mutilated here and there, built into the walls of ancient churches. They held to the quadral division of time, distributing the day-night into four, eight, or sixteen parts, which commenced and ended with 4:30 A.M.; and it was not until the Renaissance that in England and on the Continent, the more perfect dial was adopted and passed into ordinary use. We have a dial in *Albert Durer's Melancholia*. Henry VIII. maintained a "diviser of horologies," Charles I. gave his pocket dial to his attendant just before his execution; the Seven Dials of the London slums, set on a block of stone where seven streets converged, are described by Evelyn, in 1694, and commented on in Gay's *Trivia*. Sir William Temple ordered that his heart, inclosed in a silver vase, should be deposited under his sundial at Moor Park; the dying words of Howard, the philanthropist, have been handed down:—"Suff'r no pomp to be used at my funeral, no monument to mark the spot where I am laid; but put me quietly in the earth, place a sundial over my grave, and let me be forgotten!"

And here sundials, supplanted by the pendulum clock, would become mere tenants of the limbo of survivals; their literature, like themselves, "falling into the portion of weeds and worn out faces," but for the fresh interest awakened by the mottoes which, from the sixteenth century onwards, makers were wont to inscribe upon them. Few men can be so dull of imagination, or so unconscious of varying words as not to feel thoughts devout, fanciful, scholarly, consolatory, sad, or genial, spring up within in answer to their silent admonitions—

"Ghostly shapes

There meet at noontide;—Fear and trembling Hope,
Silence and Foresight, Death the skeleton,
And Time the shadow."

Grateful to those who have condensed the happy inspiration or the brooded moral into the witty or the pregnant saying, and eternalised them in graven form, we find the motto-dial, with Charles Lamb, "more touching than a tombstone." Of the 700 specimens collected in Mr. Gatty's beautiful *Book of Sundials*, scarcely one is commonplace; even the

familiar, "Tempus edax rerum," "Præterit ætas," "Sic transit gloria mundi," enforce attention, like John of Gaunt's dying words. Occasionally they are classical, as in the happy adoption of Horace's "Eheu fugaces!" "Labitur et labetur," "Vestigia nulla retrorsum;" more rarely a play on words, as "Fugit hora, ora;" the quaint rebus, "We shall—(i.e., dial = die-all);" the inscription on a dial made of Mulberry wood, "Memento Mori" (morus being Latin for a Mulberry). Often they are happily sententious: "Now is yesterday's to-morrow;" "Aspic, Respice, Prospice" (Look, look back, look onward); "Meam non tuam nocis" (Mine thou knowest, not thine own); "Scis horas, nescis horam" (The hours thou knowest, the Hour thou knowest not); "I mark time, dost thou?" "Begone about your business," formerly on the Inner Temple Terrace, was the peevish utterance of a busy Benchman whom the artist imperturbed for a motto. The man accepted it as intentional, and its unexpected appropriateness caused it to be retained. Harriett Martineau, original in everything, emblazoned on her Anleside dial words of her own invention—"Come, Light, visit me!" and Wordsworth gave his hearty approbation to the motto. Not far off, at Neam Crag, near Skelwith, is a fine adaptation from the *Vulgate*—"Sicut umbra ejus, ita lux ejus," (The darkness and light to Thee are both alike). "Ich dien," is obvious but significant; "Alox Nox," untranslatable without loss of force; jolly and hospitable is "Amicus quælibet hora" (Do friends any hour they please). "Detego tædium" (covering I discover), sums in two words the sentiment of Blanco White's splendid sonnet, "Vivit memoria fugit hora" (The hour flies, the memory abides), may be expanded into Tom Moore's juvenile lines:—

"When Time, who steals our years away,
Shall steal our pleasures too,
The memory of the past will stay,
And half our joys renew.

"Then talk no more of fortune's gloom,
Our joys shall always last,
For Hope shall lighten days to come,
And Memory guide the past."

The most beautiful of all perhaps is, "Horas non numero nisi serenas" (I reckon none but shining hours); the most impressive, from an epigram of Martial, "Perunt et imputantur" (They pass, but their account is kept).

"No garden is complete without its sundial," is the practical outcome of our homily. When spade and trowel have done their work; when constructive effort is satiated, pictorial grace produced, there remains a reserve of enjoyment to the gardener who loves his plants for themselves as well as for their show, in contemplation of the imperious organic forces which his hand has set in motion, of the mysteries of resurrection, life, decay, at which he sits half dramatist, half spectator, of associating his favourites with myth, legend, folk-lore, weird superstition, and poetic fancy. To these higher temperaments plants and sundials harmoniously minister; in colour, as in shadow, children of the sun; unobtrusive yet unresting chroniclers of fleeting time; prophetic, by their daily vanishment into the night, when none can work; hopeful in their fixed awakening, the dial from its nightly obscuration, the flowers from their winter sojourn out of sight. If there are tongues in trees, there are no less sermons in stones; every "lurgedoned maze of Quick"—every "span of shade that steals"—combine to make one music. *H. Tuckwell, Stockton.*

[The fine old sundial represented (fig. 113) is in the possession of Sir F. Milbank, of Thorpe Perrow, Bedale, and stands in a central position in the flower garden at that beautiful place, an object of interest alike to the proprietor and to his gardener. Ed.]

CALYCANTHUS FLORIDUS.—Every shrubby border should contain a few plants of this *Carolina Allspice*. It is a bushy plant, growing from 5 to 9 feet in height, according to soil and situation, and does best in an open sunny situation in any kind of soil from peat to light loam, providing the drainage is good. Its dusky, aromatic flowers are produced freely from the middle of May to the middle of July. The plants should be spurred in a little at the fall of the leaf, so as to secure compact, free-flowering bushes. *H. B.*

THE SCIENCE OF HORTICULTURE.

The science of horticulture is many sided, and sometimes ill-defined. The better part of it may be expressed in the phrase, "Variation of plants under culture and selection." In many cases, the effects of the simplest operations of culture are not well understood. The mere accident of variation in soil may be found to modify plants, sometimes profoundly. Sandy soils tend to produce high colours and high flavours, in consequence of their greater warmth. Peaches are nearly always richer in colour and flavour on such soils than on wetter and stronger soils, other things being equal. Squashes often show remarkable differences when grown upon different soils, and these differences can sometimes be perpetuated for a time by seeds. The writer has produced from the same parent Squashes so dissimilar, through the simple agency of a change of soil in one season, that

and rich soils varieties tend to "break," or to assume various forms; and this "breaking" is the inception of new varieties. Our general knowledge of the influences of soils upon plants, of which these illustrations are trifling examples, is wholly fragmentary.

Change of latitude often works great change in cultivated plants, and yet the change is so obscure as to lead good observers to declare that acclimatisation does not exist. The most apparent effect of removal through degrees of latitude appears in the stature of the plant. Northward, plants are smaller, dwarfer than southward. As a rule, dwarf plants are relatively more productive than large ones, and as more plants can be grown upon a given area, it follows that they give greater total yields in field culture. But there must be a point beyond which dwarfing is unprofitable, as diminutive plants can produce little. In other words, there must be for each species a most profitable ratio of size of plant

explicit laws known concerning plant breeding by simple selection. It is tolerably well known that the character of offspring is determined by the character of the parent as a whole, rather than by that of any individual part which we may desire to improve. Small tubers of Potatoes from large or productive hills give larger yields than large tubers from small hills. An experimenter laboured in vain for many years in the endeavour to improve the Tomato by selecting seeds from best fruits, but when he began to select seeds from fruits of best plants success came rapidly. So it appears that even so simple a matter as "selecting the best" may result in poor practice. *Extracts from an article in the "American Garden," by Professor Dudley.*

INDIA.

FLOWER SHOW AT BOMBAY.

The Victoria Gardens at Bombay have undergone many vicissitudes during the twenty-five years they have been open to the public, and until lately did not give unalloyed pleasure to the numerous travellers, familiar with public gardens in Europe, who passed through Bombay. Such visitors seem to imagine that because heat and moisture are brought into play to produce the most cherished objects of the garden in Europe, that to keep up a magnificent garden in Bombay must be an easy task. Such is not the case. The continual presence of heat and moisture, with no escape from it, perhaps requires more skill to contend with than the frequent absence of those two important conditions necessitates.

During the last two years much of the necessary skill, embodied in Mr. G. Carstensen, has been brought to bear on the work, and in consequence the garden has undergone a great moulting; its old bedraggled feathers have been removed, and the new plumage undoubtedly is very attractive. All the good features of the old garden have been brought into prominent relief, and the objectionable removed. The animals are being removed from the shabby maldorous huts they occupied, and accommodated in well-designed ornamental structures specially adapted to the wants of the occupants. This has cost much money, which is being reimbursed by a small charge made for entrance. In the renovated Victoria Gardens a horticultural exhibition was held on March 26, and two following days, at which valuable prizes brought out some of the showy contents of Bombay gardens, which, combined with the presence of Prince Albert Victor, certainly brought much money from the pockets of the citizens.

The exhibits were much of the same character as would be produced on a similar occasion in England. Showy Crotons, Colus, Dracenas, Palms, and Panax, were the staple. Fine collections of Ferns, chiefly Adiantum, with good specimens of A. Farleyense, accompanied by numerous seedlings of that Fern, which the exhibitor, Mr. Luard, finds springing up freely on the floor of his Fern-house. A solitary group of well-flowered Dendrobium, chiefly from Northern India, and Phalenopsis, attracted much attention, as they were very tastefully arranged by the amateur owner. Aristolochia elegans was shown in good condition. Eucharis, Hippeastrum, and quantities of the hardy annuals of England, contributed by the Victoria Gardens, and tastefully arranged by amateur members of the committee, improved the general effect.

Among fruits, the Banana, Grape, Santura Orange, Sapodilla, Pommelo Mango, and Melon, were shown in good condition.

Of vegetables, Cabbage, Cauliflower in fair condition, Celery only fit for flowering, fine white Onions, and red-skinned Potatos, were prominent; and a vegetable that is not sufficiently known—the Dilpassand (*Anglice*, Heart's-delight), *Citrullus fistulosa*—was shown in good condition. This fruit is used for the same purposes as Vegetable Marrow; it is very good, the flavour approaching that of a new-laid egg.

FIG. 113.—OLD SUNDIAL AT THORE FARROW. (SEE P. 676.)

they might readily be taken for distinct varieties. Peas are known to vary in the same manner. The ends of a row of Peas, sown of the same kind, last year gave the writer marked variations due to differences in soil. Many well known varieties are less distinct than were the two extremes of this planting. Light soils also tend to shorten the period of growth. Upon such soils plants mature earlier, and are consequently hardier. This is one of the earliest lessons which the fruit-grower masters. It is not known if this character attained from soil, is transmissible to offspring. Light soils tend to make most plants smaller. Pea growers characterise soils as "good" and "viney." Upon the latter sort the plants run to vine at the expense of fruit, and their offspring, for two or three generations, have the same tendency. Light soils decrease the tendency to vary. Of many plants seedsmen secure best seeds from such soils. These seeds are more likely than others to "come true," to reproduce their parents closely. Upon heavy

to quantity of fruit. Experiment can determine this ratio, and must then seek to produce it. In general, transfer in latitude seems to be the readiest means to accomplish this object. When the latitude of most profitable production is determined for each species, the plant can there be propagated for dissemination elsewhere. Variation in reference to latitude is apparent in many directions. Colour, flavour, habit of plant, and even variability itself, all are modified in many ways through laws of latitude, altitude, and climate which we cannot yet announce.

Plants respond in a wonderful manner to man's care through direct selection. "Like produces like," is to the gardener a law of circumstances and conditions. If the phrase were strictly true, we should expect no improvement in varieties. We should still know only the old Cherry Tomato and the single white or pink Petunia. When once a species begins to vary, is "broken," man's power over it is marvellous. In a score of ways it responds to his touch. Yet, strangely enough, there are few

On the whole, it is evident that the public of Bombay have not awakened to the idea of competition at horticultural exhibitions, nor are they likely to do, so long as intervals of about ten years are allowed to elapse between the exhibitions. If flower shows were arranged annually the spirit of competition would be developed, to the infinite benefit of horticulture in the city that claims the second place in the British empire. *G. Marshall Woodrow.*

FORESTRY.

PLANTING CHALKY SOIL ON THE SEA COAST.—The difficulties to be encountered either in planting chalky ground or exposed seaside situations are great enough, but when we have to contend with both these combined, the task becomes one that is fraught with unusual and peculiar interest.

Along the sea-coast from Folkestone to St. Margaret's Bay, are at least a few examples of the particular trees and shrubs that succeed fairly well under the combined influences just described, as well as the methods pursued in planting and after-management.

Having for the past few years had some experience of tree and shrub planting along this particular coast, and in the worst class of soil and most exposed situations, I may be allowed to say a few words regarding not only the best system of planting, but the kinds of plants to be used. No more salutary lesson could, however, be learnt than from a keen scrutiny of the various kinds that do best in the numerous grounds and gardens along the coast. On Lord Granville's property, I have noticed, in the exposed chalky cliffs which rise perpendicular, or almost so, for 500 or 600 feet, the tree that does better than any other is the Austrian Pine (*Pinus austriaca*).

The growth, as might well be expected on so high cliffs and fully exposed to the Channel winds, is not what one is accustomed to see in inland woods and parks, but it is, nevertheless, so stout and well-formed that even the most severe hurricanes seem to do it but little harm. In such situations I have frequently noticed that the spread laterally is out of all comparison with the height of the plants, and where shelter is of paramount importance this mode of growth is perhaps quite as valuable as had the shoots a more upward inclination.

When compared with the Austrian, the Scotch Fir (*P. sylvestris*) is a good way behind; but for all that, it is of great value for planting on exposed chalky ground. The Evergreen Oak (*Quercus ilex*), is certainly a most valuable evergreen for the sea-coast, as it takes kindly to exposure and the saline blast, while for planting in chalk it is all that could be desired.

Amongst deciduous trees, the Sycamore seems to be one of the best, for it comes out fresh and green, and without the dying-off tips that make the majority of trees so unsightly in exposed and high-lying maritime situations. Two species of Poplar and two of Willow grow with unusual freedom at St. Margaret's Bay, and they seem little the worse for the stiltish winds to which they are often subjected.

Shrubs that will thrive on chalk, and within sea-influence are not a few, for I have noted rather a long list of such as are in every corner of the world to be recommended for the rather peculiar conditions. Everyone knows that the Tamarisk and Eucalyptus are proof against the rather saline blast. The following are excellent:—The flowering Currant (*Ribes sanguineum*), Sauberry (*Symphoricarpos racemosus*), oval-leaved Privet (*Ligustrum ovalifolium*), Sweet Bay, Lavender, and Veronica spicata—the latter is a valuable shrub for chalky soils on the sea-coast, it grows very freely, and produces an abundance of showy flowers.

Juniperus communis, hardly half-a-foot in height, but in broad and dense patches of several feet across, I found in quantity on some of the more easily ascended chalk cliffs, thus showing that for withstanding the double influences of chalk and saline air it is of value. The *Laurestinus* must not be excluded from the list. Two plants that, above all others, do well, are the New Zealand Flax and Pampas-grass, the former in particular sending up stout leaves 5 feet high and 4 inches wide in the Hermitage garden at St. Margaret's Bay.

Having given a short but reliable list of trees and shrubs for planting on pure chalk, or almost so, and on the seashore, it may, in conclusion, be well to point out some of the drawbacks to successfully establishing any or all of these named.

In the first place, more deaths are due to bringing the plants from sheltered inland situations than to any other cause I know of. To give an example: for the past two years I have been sending picked plants from the home nursery at Holwood to the seaside at St. Margaret's, nursery and by picked plants I mean such as were in perfect health, well rooted, and of stout build. Now in planting these, along with others that had been grown in a temporary nursery on the seashore close to where they were to be used, the differ-

ence in growth was very marked; indeed, so marked that I intend having all plants that are for this particular place transplanted to the nursery in question for a year at least before being planted out permanently. *A. D. Webster.*

PLANTS AND THEIR CULTURE.

FERNS.—If the Ferns were repotted early in the year the pots will be filled with roots, and some weak liquid manure may be afforded them; and more space will be required for the further development of fronds and to prevent loss by damping. By removing the *Adiantums* required for cutting purposes to a slightly cooler house, this object will be attained. Ferns will now require to be shaded during warm sunshine, but the shading should be portable, as nothing spoils them sooner than perpetual shade. The late *Adiantums* should have been repotted, and then placed in a cool house, not syringing them overhead. These cool grown plants are better for cutting than others grown warmly. We reserve a few dozen plants every year for this purpose, and grow them in cool pits.

Filmy Ferns should be frequently syringed overhead, a trifling amount of fresh air being afforded them daily, and denser shade—when shade is required—during the next few months. *Gymnogrammas*, now growing freely, may stand in the driest and warmest part of the house. *Gymnogrammas* suffer if syringed, and they do well in a house devoted to plants requiring little atmospheric moisture, succeeding wonderfully in houses in bad repair where much glass is broken, and in vineries. Small plants that have grown from spores are often found in various parts of the house growing on walls, under the benches, &c., these should be collected and potted. Slugs are troublesome on *Gymnogrammas*, destroying the young growths if not diligently searched for in the evening.

Davallias, and other species of Ferns employed in hanging baskets, will now require abundance of water to keep them in good condition, sometimes soaking the baskets in a water-tank—merely watering them with the can being insufficient. *Nephrolepis* are good basket Ferns, and make splendid plants; *N. exaltata*, *N. davalloides*, *N. tuberosa* and others, if kept thoroughly moist.

Adiantum ananthe, the useful *Asplenium flaccidum*, and *A. longissimum* are also desirable Ferns. Any refurbishing of baskets should get instant attention, keeping the newly-planted ones in a moist house for a short time. Ferns infested with scale should have all infested fronds removed and burnt, and if nearly bug should be present, the Ferns, if not valuable, should be destroyed. *Pteris serrulata* is best when grown in a cool house if the fronds are intended to be cut, as they are then more lasting. Many of the more robust of the *Pteris* are benefited by frequent applications of manure in a much diluted state.

Glichenias, now making progress, should have their creeping rhizomes pegged down to the soil. Such Tree Ferns as *Dicksonias*, *Lomarias*, *Cyatheas*, and *Asplenias* which are throwing up fronds in quantity must be encouraged to grow by syringing the stems three or four times a day from different points, so as to wet every part of them. Any sickly plants can be encouraged to make new roots by binning fresh sphagnum moss round the stems. Any unsightly fronds may be removed to make room for new ones, and especially should the dirty fronds be cut off. Hardy deciduous species which were housed should be removed to a cool frame facing north, where they will make strong growth. These hardy species will be found useful in places where it would be undesirable to put choicer varieties. *Geo. Wyles, Syon House, Brentford.*

THE FLOWER GARDEN.

BEDDING OUT.—If the various hints given in preceding calendars have been made use of, much time will be saved now that the bedding out the summer occupants of the flower beds must be taken in hand. Before putting any plant into the soil, it should receive an hour or so previously a thorough watering; and in planting, the soil round the roots should be made firm with the hand. When the planting of a bed or series of beds is finished, and no rain fall, the soil should receive a good watering, and when it becomes somewhat dry afterwards, the surface

QUINCES, MEDLARS, CRABS.

WE are reminded at this time of year of the great amount of floral beauty found in these fruit trees and which remain in great part neglected in many gardens and pleasure-grounds.

On sunny banks, and other warm situations that are not too dry, the Quince develops into a large bush, that is every year covered with its large white blossoms, to be succeeded by bunches of round or Pear-shaped fruits. It need not be told with what satisfaction the fruits are regarded by the housewife for imparting a piquant flavour to her Apple tarts, and to make a marmalade that shall almost equal in its delicacy of flavour that made from the Guava.

The Medlar is even a more abundant bloomer than the former, and an ornament to any lawn or shrubbery. It is quaint and compact of growth, not rapidly outgrowing its position. The fruits, if not liked as dessert, make the finest of jelly, if first allowed to become blotted. The small fruited variety is the greater bearer, and the best in flavour.

Of Crabs, there are numerous varieties, all equally hardy and floriferous, not requiring to become aged before flowering. A few species may be here mentioned:—*Pirus (malus) pumila*, a native of South Russia and the Caucasus, bushy in growth, fruit yellow or reddish; the species is often employed as a stock for dwarf Apple trees. One variety is the *Donjon* of the French, and another the *Johannis Apfel* of the Germans. *P. malus frutescens* has smooth leaves, and increases in size by suckers thrown out by the parent stock when unworked; *P. acerba*, the common Crab, the parent of all cultivated Apples; *P. prunifolia*, the Plum-leaved Siberian Crab, grows from 18 to 30 feet high when on its own roots, but may be dwarfed by working it on the *Donjon*; the fruit is as large as a walnut, reddish-yellow in colour. *P. prunifolia* is sometimes known in gardens as *P. sibirica*, *P. polonica*, and *P. græca*.

P. spectabilis is a well-known Chinese species, with rosy red-yellow fruits. *P. s. floribunda* has wood-buds and flower-buds of a carmine colour just before they expand. The type and its varieties flower most freely; and *P. s. Sieversii* has double flowers of a lively red colour. *P. baccata*, the berry-bearing Crab, is a tree or a bush according to its training; flowers, like most of the genus, are white, the fruit round, reddish-yellow, with long stalks and hanging in bunches. There are in nurseries some eight or nine varieties of this species with fruits of various colours. *P. b. præcox* is fourteen days earlier in flowering than the other forms; and *P. b. cerasifera* has fruit of a yellow colour larger than any others.

America has several species of Crab, but as these are seldom met with in our country, mention of their names must suffice. *P. angustifolia*, *P. coronaria*, and *P. Torringo*. The fruits of all Crabs are eligible for all the purposes for which Quinces and Medlars are fitted, and for bottling.

EPIMEDIUM DIPHYLLUM.—This pure white variety is an excellent one for the rockery, or a nook near the water's edge. A correspondent says that he has it growing at the foot of a stone bridge amongst the stones close to the water, and it succeeds well. The ground during the winter is covered with *Sedum Lydium*, which makes an excellent carpet for hiding the soil at that time, and also in forming a suitable contrast to the flowers. The leaves are supported upon slender stalks, are not deeply veined or marked as in the larger *E. alpinum*, but are extremely pretty when in young growth during the early part of May. Propagation is easily effected by dividing the roots in the autumn or early in April before the new growth commences.

should be loosened up and raked moderately fine, although soils which cake readily after rain are the better for being left with a rougher surface.

Sub-tropical Plants.—Weather permitting, the tender plants employed for filling the beds in the sub-tropical department may generally be planted, only in unsheltered gardens and in northern counties may the work be deferred a little longer. A rich soil, good drainage, and in some cases beds slightly raised above the level of the lawn are essentials of good growth. Do not plant thickly, but allow each plant space for full development without crowding its neighbour. Sub-tropicals, as soon as planted, should be staked if standing in need of support, and watered. Opinions differ as to the position these plants should occupy. A few are admissible in the flower garden proper, where as foils to flowers and flat beds they are appropriate. The dwarfier Castor Oils, Cannas, Eucalyptus, Grevillea, Abutilon, Wigandia, and some of the dwarfier Solanums, are some that admit of being used in that part. They are best grouped by themselves, but may also be dotted amongst the flowers, but not everywhere. As a rule, the taller sub-tropicals are better in sheltered nooks, where the sun reaches them the greater part of the day, or in a garden by themselves. Wherever they are placed in masses, some tall flowering plants should be added to relieve the monotony of green leaves. The following are the names of a few such: the taller species and hybrids of flowering tuberoses, Begonias, Dahlias, single and double flowered, Hollyhocks, Plumbago capensis, Fuchsias, Delphiniums, Polyanthias, Roses trained as pillars, Funkia Sieboldii, P. subcordata, Everlasting Peas, Hellebrychium monstrosum, Erythrina crux galli, and Campanula pyramidalis. And it goes without saying that all groups look better when some dwarfier plant, flowering or not, is employed as an edging to the same. When the bedding out is completed, a general tidying up should follow, the edgings to be laid and walks cut evenly and the grass swept, and everything made neat.

Miscellaneous.—The seed pods of Rhododendrons and Azaleas should be removed, and herbaceous plants staked and tied up loosely but neatly. Examine the Rose bushes and standards for caterpillars and aphids. Hand-picking is the only means of destroying the former, and tobacco water mixed with clean water for the latter. Good tobacco water will require to be diluted with ten times its bulk of water. An infusion of quassia chips is a cheap insecticide for use against aphids; and for mildew, syringing with soap-suds and a slight dusting with flowers-of-sulphur is efficacious. *D. C. Powel, Pombroia Castle, Devon.*

THE ORCHID HOUSES.

EAST-INDIAN HOUSE.—The Phalanopsis, now growing and rooting vigorously, will need encouragement to make their growths as large as possible, and to this end weak liquid cow-manure may be given them with safety once a week. Manure should not be afforded these plants unless they are making leaves. Lose no opportunity of sponging the foliage with soft-soap water. As the leaves of Cattleya Dowiana burst, and show flowers or not, the plants should receive a good watering. Any plants that do not show sheaths will require to be rebasketed, an operation that may now be done. As compost, use three parts fibrous peat, and one of sphagnum moss, and if a few potsherds be mixed with the above it will be better for the roots of these Cattleyas, which cling to and run over hard but porous substances. Cattleya Eldorado and its varieties should be grown in this house, and not grown so cool as is often done. Where Dendrobiums are grown in this house, they should be so placed that the syringe may be freely used upon them without water touching such plants as Phalenopsis and Calanthes. Calanthes, as the roots begin to fill the pots, should gradually receive more and more water, but, like most bulbs, they object to have water in their neighbourhood until roots are emitted.

Cattleya Lawrenceana, which has been flowering in the Cattleya house, should now be brought back to the East-India house, and placed in a light position near the glass, and if repotting is required, it should now be done, employing the same kind of compost as that advised for C. Dowiana. Cypripedium niveum, C. Godefroye, and C. concolor, will now be the better for being syringed overhead every day, in the morning; but care should be taken to place these plants close to the ventilators or the door, so as to ensure

good ventilation, for if this matter be neglected, damping off of the growths is almost certain to occur, no matter how much care be taken in the watering. Sudden chills must be avoided, and where the shading over Phalanopsis is thin, it is a good plan to paint the glass above them, as very strong light is not good for their well-being. The temperature should range from 70° to 75° at night, with a rise of 15° by sunheat.

Cattleya House.—The greater number of the plants of C. Skinnerii will now have passed out of bloom, and should be repotted, at least those that require it; but this species does not like its roots disturbed, and where the pots are filled with roots, the greatest care should be taken to first break the pots and carefully remove the roots from the potsherds with a thin bladed knife, and not disturbing the roots which may have coiled round the drainage materials, which should be placed intact in the new pot, putting some more potsherds around these. A compost consisting of three parts fibrous peat and one of sphagnum moss will suit these plants, little water being necessary for a month afterwards, if the potting materials were moist when used.

The white varieties of *Leelia* anemop, now growing away freely, may be syringed overhead every day, in the morning; the roots of these plants seem to like to ramble away from the potting material, so that it becomes necessary to adopt this means of keeping them moist. It will now be necessary to increase the moisture of this house; all stages, walls, and floor should be saturated morning and afternoon, the shading removed about 3 P.M., and the house shut up, the thermometer being allowed to touch 95°, with a minimum night temperature of 65°. *A. G. Catt, Parkfield, Worsley.*

THE HARDY FRUIT GARDEN.

THE ORCHARD.—Newly-planted trees will still require attention, not only in supplying the roots with water, but a larger quantity of mulching, which should be of a loose nature. The season so far has been dry, and unless mulching be attended to, on light soils in particular, the wood buds will not develop into more than a tuft of small leaves, which will form undesirable fruit buds. Trees newly grafted should be examined, and if the clay be found in a cracked state, which, after dry weather, is very probable, it should be smeared with a thin wash of clay and cow dung, the aim being to keep the scion in a fresh, moist condition, which can only be done by the exclusion of the air. When necessity has compelled the grafter to employ scions from trees affected with American blight—always a misfortune when it is carried into healthy orchards—a keen outlook should be kept on such stocks, and should the blight make its appearance, a dressing of the following mixture should be given: half-a-pint of petroleum should be put into one gallon of the before-mentioned wash of clay and dung, and be worked well into clay and bark with a brush, both above and below. This will be found a really safe remedy. *A. Evans, Lythe Hill, Hants.*

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—Keep those trees clear of insects from which the fruit has been gathered, using the syringe daily for that purpose, removing the overhead lights if that be possible. The trees will be benefited by supplies of liquid manure, and should be afforded every facility for thorough but not hurried ripening of the wood. Any hastening of this process of wood maturation would lead to the trees making with ill results. Thin out, or prune away weak barren shoots, and those which have borne fruit this season, and which possess a young shoot at their bases, laying in the latter. If this system of summer pruning be carried out, there will be but little winter pruning to do, and it is much the better plan. The foliage will be sufficiently thinned by this pruning, as to admit of the sun's rays reaching the borders in many places, also an advantage. Dryness at the roots from now onwards, is the sure precursor of bud dropping in the spring, and should never be allowed. If fruit is wanted to send long distances, it must be gathered when rather under than over ripe, and various methods will suggest themselves by which awkwardly situated fruit may be detached without injury. Fruit carefully gathered is capable of being

kept in good condition for a week in a cool room if put on trays lined with tissue paper and cotton wool or elastic dry moss. A few remarks on packing Peaches may here not be out of place. I consider dry elastic wood net the best material when it is gathered and prepared in the winter, and the dust beaten out of it, and all hard substances removed by hand. Such moss does not heat, and remains always elastic and soft. Each Peach should be wrapped first in tissue paper, four inches square, and the boxes, which may carry one or two dozen, should be corded together when packed. The boxes should be lined with moss, and each Peach arranged firmly in its nest of moss, in which it will travel by rail or road safely. We use this same kind of moss for packing Figs, Grapes, Melons, Pines, &c., and it may be confidently recommended as being superior to anything else. There is in most no objectionable odour to be imparted to the fruit, which cannot be said of other substances. Even dead, if strongly impregnated with turpentine, has been known to give a flavour to ripe Peaches which were packed in boxes made of it. Finally thin the late Peaches, and do not leave one shoot more than is necessary; expose every fruit to direct sunlight, and bring them up on to the trellis by pieces of lath placed beneath them; give manure water to the roots, and mulch the borders to check evaporation. Look out for insects, and immediately apply remedies; and afford the trees a genial temperature, with some small amount of frost air at night. *W. Camp, Malvern Court, Malvern.*

THE KITCHEN GARDEN.

The various crops are now growing apace, and need a great deal of attention as regards keeping the surface of the soil frequently stirred with the hoe, and thinning the plants as soon as strong enough, taking advantage of showery weather whenever possible for the latter operation.

Onions should be thinned when a few inches high, notwithstanding the fact that if they were left till a later period, they would be more serviceable in the kitchen. It is always better to remove some when quite small when very much crowded in the rows, and use them in filling up the vacancies elsewhere, or even bud them apart if the supply is not a very good one. Sow thickly for salad purposes a bed of any kind of Onion. In thinning out the main crop, plants at 1 inch apart at this early stage will suffice, and at the final thinning allow 4 inches between the bulbs. Employ the Dutch hoe between the rows as soon as the thinning has been finished for the purpose of stirring the surface, and filling up holes about the plants, which, if dry weather set in, would be injurious to them. The free use of fresh soot on dewy mornings, where maggot is troublesome, should be practised.

Carrots, Parsnips, Salsify, Scorzoneria, &c.—These root-crops will be large enough to be thinned, and, with the exception of Parsnips, which may be left at 10 inches apart, 8 inches will be a suitable distance to leave the plants. The Early Nantes Carrot may be left thickly in the beds, and thinned when drawing for use.

Vegetable Marrows and Ridge Cucumbers.—Plants may now be put out on prepared beds, before doing so making sure that the ball of earth is thoroughly moist. In planting, some fine soil should be placed about the roots and made firm, and sufficient tepid water afforded to settle the soil. The bins should be pegged to the ground at equal distances apart. If handlights are available, these may be placed over the plants for a few days, and failing these a few branches of evergreens may be stuck in the ground on the exposed sides.

Jerusalem Artichokes.—These require similar treatment to Potatoes, and to have the tubers large in size a change of soil is equally essential. The spot chosen should be open to the sun. When the plants are 6 inches high the hoe should be run down the rows to eradicate weeds, and when 8 inches high they should be earthed up as Potatoes are earthed up.

Leeks.—Transplant the early plants on to heavily manured land, or into trenches prepared as for Celery. The manure should be thoroughly rotten. Leeks require plenty of space to develop fine stems, and 10 inches apart is not too much for The Lyon and Ayton Castle varieties, but the smaller growers may be planted much nearer together. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY, JUNE 1. Reading.
Bath and West of England (till the 10th).

SALES.

TUESDAY, JUNE 2. Orchids, Imported and in Flower, at Protheroe & Morris' Rooms.
FRIDAY, JUNE 5. Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY, JUNE 7. Greenhouse and Bedding Plants, at Stamford Hill Nursery, Amhurst Park, N., by Protheroe & Morris.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59°·1.

The Temple Show.

It is satisfactory to have to congratulate the Royal Horticultural Society on having scored a success in the matter of the Temple Show. The Society has had a terrible ordeal to go through, but, thanks to the indefatigable energy of its officers and Council, we may now fairly say that it has weathered the storm, and we hail with delight every fresh instance that it is again winning the confidence of the public. It amply deserves it, for even during its days of deepest humiliation it endeavoured to keep up the old traditions, and demonstrated that the holding of flower shows and the encouragement of rival exhibitors, was not the be all and end all of horticulture. If it has failed fully to realise the ideal, it must be remembered what difficulties and dissensions it has had to contend with, and that it is a very human institution after all. Being human, it must still take cognisance of the rivalries and emulation of the exhibition tent, and of the legitimate requirements of the commercial sections: but it must always be borne in mind that these are really only incidental to the main object—the promotion of horticulture.

At present the general public hardly recognise what horticulture really is. They look upon it too much in the light of a mere recreation and a gratification of the senses—but it is far more than that. Intellectually it ranks as an applied science, demanding for its study the highest powers of the mind. Economically it is of the greatest importance as an industry, in which vast capital is sunk, providing occupation for an army of workers, enlarging and improving the food-supplies of the nation, whilst nothing is more certain than that the agriculturists of the future must study the methods and practices of their

horticultural brethren if they wish to turn the land they occupy to the best advantage.

These are the lessons which the Royal Horticultural Society has to impress upon the public, and it does so by its experimental gardens, in the work of its Committees, in its publications, and in its most useful Conferences. But there must be some "cakes and ale" for the public, the ordinary fellows must have something for their money, exhibitors must have an opportunity of displaying their merchandise, and the healthy stimulus of competition must not wholly be ignored; and thus it happens that such things as "Temple Shows," though by no means of primary importance, are a necessity.

A specially interesting feature and wholesome indication was afforded by the number of provincial exhibitors. The magnificent Filmy Ferns of Messrs. BACKHOUSE, of York; the Ferns of Messrs. BIRKENHEAD, of Manchester; the Clematis of Messrs. SMITH, of Worcester; the Pionias of Messrs. KELWAY, of Longport; the Orchids of Mr. CYPHER, of Cheltenham; the Pansies of Messrs. DOBBIE & Co., who hail from as far off as Rothsay, are instances in point. These are excellent indications of the influence which the Society is regaining in the provinces, and which it should never have lost.

If these shows on a large scale are to be repeated in future, it will be desirable to make them more interesting to connoisseurs by the exhibition of a greater variety of plants, and especially of new plants, which were almost wholly wanting on this occasion. It may, however, be urged that the fortnightly meetings are more appropriate for such exhibits, which can be more carefully examined on those occasions than in the crush of a "big show." A similar argument, however, cannot be maintained against the introduction of fine foliage plants, Palms, Cycads, Tree Ferns, and specimen plants generally arranged in pictorial groups. These are things, the beauties of which could be much more readily appreciated by the public than the differences between one Orchid and another. For instance, the reporter of one of the daily papers expresses his astonishment at experts for seeing any resemblance between *Cymbidium Lowianum* and a *Cattleya*!

The exhibition on Wednesday and Thursday last was fortunately held in fine weather. The show was excellent, as will be seen by the details given in another column. It was numerously attended; while the fact that it was opened by His Royal Highness the Prince of WALES gave an added *éclat* to the proceedings.

In addressing the Prince, the Secretary, Rev. W. WILKS, said:

"May it please your Royal Highness,—

"The Council of the Royal Horticultural Society desire to tender to you, on behalf of the Fellows of the Society, and the horticulturists of the kingdom, their grateful thanks for your presence here to-day. The Royal Horticultural Society was founded in the early years of the present century. It has been honoured with the gracious favour and support of Her Majesty the QUEEN, and her predecessors, and was presided over for several years by the PRINCE CONSOBR. The Council believe that the Society has, during the eighty-six years of its existence, conferred incalculable benefits upon the kingdom, by directing and fostering a love of horticulture, and by the introduction and acclimatisation of a vast number of trees and shrubs, fruits and flowers, which beautify all parts of our country.

"The Council are aware of the great interest taken by your Royal Highness in the work of the Royal Agricultural Society, and they are anxious to secure your interest in the work of the Royal

Horticultural Society. This work they believe to be under the altered conditions of agriculture, of national importance, in that it encourages the application of horticultural methods to agriculture, enlarges the field of profitable cultivation of the soil, and varies and increases the food supply of the people.

"The Royal Horticultural Society, in addition to its ordinary work, is now devoting its energies to the provision of a great national want—a central Metropolitan hall or home for the horticulturists of the kingdom. Such buildings exist in the chief European capitals and in the United States, and the Council have ample evidence from amateurs, and the very important trade engaged in horticulture, that they are urgently required in London.

"We earnestly trust that the aims and objects of the Society may recommend themselves to your Royal Highness's support."

His ROYAL HIGHNESS replied as follows:—

"Sir TREVOR LAWRENCE, Ladies, and Gentlemen,—I am very much gratified by the address I have just heard, and I beg to assure you that I have visited this exhibition with the greatest possible pleasure and interest. I have always taken a great interest and pleasure in horticulture, and I must say I have never seen a more beautiful show than that we have witnessed to-day, or one better arranged. The best proof of the success of the Society is the fine show we have all witnessed to-day. You have alluded to a great want, that of a central Metropolitan hall. I sincerely hope your labours in that respect may be successful, for I feel sure that such a hall will be of the greatest use and advantage. Let me thank you again for the address, and once more assure you of the pleasure I have had in being present."

DENDROBIUM DEVONIANUM.—This fine species, originally discovered by GINSON on the Khasia Hills over fifty years ago, and since frequently imported from many localities in Northern India, was, with D. Falconeri and others of its class, long thought to be unmanageable under cultivation, and always, until now, while one cultivator will succeed to his heart's content with it, a far greater number will not succeed in growing it satisfactorily, and hence it has from time to time, when importing has been relaxed, become comparatively rare. When once its culture is understood, however, it is a very easy plant to manage—the proper method being to give it a good growth from the present time or at least from the time its flowers go off, until the growths are well made up, and afterwards a good long rest in a cooler and more airy house, where its deciduous leaves may fall, and the pseudobulbs be thoroughly ripened and prepared for flowering the following spring and early summer. In several collections we have this month seen fine specimens—one of them in Mr. CYPHER's collection exhibited at the Temple Show—but none equal to that of the subject of our illustration, a photograph of which we received from Mr. BROWN, gr. to R. B. WHITE, Esq., Arddarroch, Gareloch Head, N. B. The specimen in question had 864 flowers. Properly its stems are pendulous, and consequently it is best suspended, but before flowering they are often trained upright, as seen in our illustration. There are a few marked variations of the species; one named D. D. rhodoneurum having smaller flowers streaked with purple, and in Sir TREVOR LAWRENCE's collection there is a very beautiful white form. The plant represented in our supplement this week is in the possession of R. B. WHITE, Esq., Arddarroch, and carried, as Mr. BROWN, the gardener, informs us, at the time it was photographed, 864 blossoms.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We remind our readers that the fifty-first anniversary dinner of this Institution will be held on Tuesday, June 12, at the "Albion," Aldersgate Street, E. C., when the Treasurer, Mr. H. J. VENTRICH, will preside, and, we trust, will be well supported.

DENDROBIUM DEVONIANUM GROWN AT AIRDARROCH.

THE LINNEAN SOCIETY.—The anniversary meeting of this Society was held on Saturday last, when the retiring President, Mr. CANNIBER, gave an excellent address dealing specially with the history of the British Flora. The facts relating to British fossil plants and to the history of those now existing were marshalled with great skill, and justified the warm eulogium passed on the address by Sir JOSEPH HOOKER. The Linnean Medal was presented to Professor HUXLEY, who stated that one of the principal objects of his career as a scientific man had been to show the close relations between plants and animals, and the underlying unity of their life-processes. He had used hypotheses and theories as scaffoldings which enabled a better view to be had of the structure, but he was always ready to abandon them when no longer serviceable, his object being the search for truth wherever it was to be found, and its pursuit without reference to incidental side issues.—At the evening meeting, to be held on June 5, at 8 P.M., the following papers will be read:—1. "On a Collection of plants from Madagascar," by Mr. G. F. SNOTT ELLIOT, F.L.S.; 2. "Dr. Weismann's Theory of Heredity applied to Plants," by Professor G. HENSLER; 3. "Teratological Evidence as to the Heredity of Acquired Conditions," by Professor B. C. A. WINDLE.

SURVEYORS INSTITUTION. The annual general meeting of the Institution, to receive the report of the Council, and the announcement of the result of the election of officers for the ensuing year, will be held on Monday, June 2, at 3 o'clock. The prizes awarded to successful candidates, in connection with the recent professional examinations, will be presented by the President at the annual general meeting. The annual dinner of the Institution will take place at the Holborn Restaurant (Venetian Room) on Monday, June 2, at half-past 9 o'clock precisely.

LILY FLOWERS. Under this name, a large trade is carried on at most of the Chinese ports in the dried flowers of *Hem-oralliss graminea* and *Lilium bulbiferum*, they are usually twisted into lengths of 4 or 5 inches; the colour is of a dark brownish-yellow, covered by a whitish bloom. They are of considerable repute as a medicine in pulmonary affections, and also largely employed in cookery, as a tonic or relish with meat dishes. They are largely produced in the northern provinces of Shantung, and sell at 7 dollars the peck (about 28c.), or hundred-weight and a quarter. In some of the large ports the trade in these flowers reaches 18,000 to 20,000 cwt. in the year. They appear in the trade routes of Amoy, Canton, Chefoo, Foochow, and Hankow.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—This Society, having completed its first session, we may review briefly the work that it has done, and is in contemplation. Fortnightly meetings have been held since last December: a paper was read at each meeting, and some interesting exhibits have added to the success of the gatherings. On May 6, a meeting was held, at which (Mr. W. M. ALEXANDER presiding) a paper was read by Mr. C. ANDERSON on "Poinsettia Culture." On the 20th, a well-attended meeting was presided over by the Rev. A. E. W. LOVELL, to hear a paper on "Plants for Decorative Purposes," by Mr. J. B. RUSNO. A lengthy discussion followed, and the meeting terminated with the usual votes of thanks. During the next four months the meetings will be held monthly.

DEATH OF A FRENCH ARBORICULTURIST.—We regret to hear that M. ALEXIS DE BUREL has recently died at Avanches, at the age of seventy-nine years. M. DE BUREL was born at Rouen in 1811, at the Jardin des Plantes, of which his father was the manager. He was for many years engaged in his native town in teaching arboriculture, and in 1853 the Minister of Agriculture appointed him to give instruction in his favourite study in the Departments of France, and for six months in every year he travelled through the different Departments,

giving personal instruction and appointing local professors of arboriculture. In addition to founding numerous technical schools, delivering his much appreciated and successful lectures, he was for a short time editor of the *Revue Horticole*, and was the author of more than one book, and of many articles in various periodicals. One of his books, "The Scientific and Profitable Culture of Fruit Trees," has been translated into English (Lockwood & Co.). Some time previous to his decease, he was forced, by failing health, to resign his professorship. At his death the lectures on fruit culture, which were given in Paris, were abolished in favour of a course on the planting of trees in towns as more suited to the requirements of the gardens and promenades of a city.

FLOWER SERMONS IN LONDON CHURCHES.—One of the prettiest sights in London, says the *Daily Telegraph*, is the display in connection with the annual Flower Sermon at St. Catherine Cree. It is said that the rector, the Rev. W. MEXNELL WHITFORD, was the first to preach a flower sermon, in the year 1853, this, therefore, is the thirty-eighth celebration of the kind. The good example has been followed far and wide, and it is now a recognised institution, not only in England, but also in Australia, Africa, and other parts of the world. The congregation was a large one, including many regular Whit-Tuesday attendants, and the floral offerings brought were afterwards distributed in worthy channels. The discourse was of a homely and simple character, the Saffron-flower being chosen by the preacher as the basis of his address. Shoreditch parish church was the scene of a curious and ancient celebration, when the Rev. T. G. BOSNEY, Professor of Geology in University College, delivered the 16th Fairchild lecture. THOMAS FAIRCHILD was a pious gardener, of Hoxton, who, in 1728, made a will by which he vested £25 in the churchwardens for the delivery every Whit-Tuesday of a lecture "On the Wonderful Works of God in Creation," or "The Certainty of the Resurrection of the Dead proved by certain changes in the Animal and Vegetable parts of Creation." Dr. JOHN DENNE began the series on May 19, 1799, and Professor BOSNEY took the same text, Matthew vi., 28-33, the theme being the illustration of Providence supplied by the Lily and the sparrow, in particular the learned preacher dwelt upon the marvels of the floral creation, and the perfection of the Divine workmanship, as seen in the tiniest and most insignificant of flowers.

M BUYSMAN'S PREPARATIONS.—We have received for publication the following appeal to all interested in botany and teaching:—For several years I have published a general analytical herbarium of useful plants, chiefly for teaching purposes. This publication has been very favourably spoken of in the following papers:—*Journal of the German Botanical Society*, November 27, 1885; *La Belgique Horticole*, 1885, p. 217; the *Journal of Botany*, March, 1886; the *Botanische Zeitung* (of Professor de Bary, 1887, p. 158; the *Oester Bot. Zeitschrift*, 1877, p. 211; the *Revue Horticole*, 1888, p. 117; the *American Garden*, 1888, p. 207, as well as by the following botanists:—The late Prof. Morren, of Liege; Prof. de Bary, of Strasburg; Prof. Engler, of Berlin; the Linnean Society of London; Prof. Willkomm, of Prague; Prof. Henriques of Coimbra, Portugal; Prof. Oudemans, of Amsterdam; Prof. Rauwenhoff, of Utrecht; and Prof. Saringar, of Leyden. The plants made use of in this publication are mostly cultivated by myself; the tropical species I got from my correspondents in India. Now my garden is too small for the wants of my subscribers, and I must endeavour to get a larger one, and as many botanists have advised me to lay out a garden sufficient for all wants, I have appealed for assistance to several countries, and got promises of contributions from Germany, Austria, France, Holland, and the United States. To get the garden and the necessary buildings I want about £3000. This garden I would lay out in a part of

Holland best suited to the purpose, and under the guidance of botanical authorities. As for the usefulness of my herbarium, the favourable criticisms of so many botanists may be sufficient proof, besides, the Linnean Society will give the necessary information to all desiring it with regard to the preparation of my specimens. The latter are really an indispensable material to all studying botany, and especially to students, pharmacists, and medical men. The editor of this paper will receive any contribution that may be sent to his address, *M. Buysman, Muldibar, Holland*.

TEMPLE HILL AND MR. HARTLAND.—We have been informed that in consequence of a clause in the lease of Temple Hill, Cork, Mr. HARTLAND has been obliged to remove all his stock to Arl-cairn. The change was of little moment, inasmuch as the position is equally well sheltered, and better still, it adjoins Temple Hill. The soil at Arl-cairn is a deep, rich, hazel loam, and has been a sheep pasture for 150 years, and is well adapted for growing Tulips and Daßodils.

FLOWERS FROM IRELAND.—We have received a few grand blossoms of Roman Ranunculuses (*Mil-ladorea*), and a new white Anemone. Of the first, we may say that they rivalled pompon Dahlias for size and symmetry, whilst the pose and delicacy of tints surpassed them. We wonder gardeners still pass these flowers by. All Ranunculus are pretty for beds and patches in the borders, and the flowers last long when cut. The white Anemone was very pure and semi-double, an acquisition. A fine yellow Tulip, *T. carinata* late, comes from Mr. BAYLOR HARTLAND. It is long-petalled, flower of a soft clear tint, and grows, we are told, to a height of 2½ feet.

A FRUIT GROWER'S GRIEVANCE.—Sanguine fruit growers, writes a correspondent, may be pleased to know the price of new Black Hamburgh Grapes, as sold by one of the leading Covent Garden salesmen, May 22, 1890. Also that of Strawberries, fine and fresh Nobles:—

12 B. Grapes, 2s.	41 4 0
1 Do. Strawberries	0 4 0
Do. Nobles	1 8 0

THE USE OF INSECTICIDES. The following details are taken from current American publication:—Professor LARK'S experiments upon spraying Apples and Pears with London Purple for the Codlin moth, give some interesting results. Four sprays were given, the last one being August 12. The treatment had a decided benefit until "the latter part of August, but from that time to the date of picking (October 1), the affected fruit increased so rapidly, that the final results on some trees of both sprayed and unsprayed were about the same. We had considered it unsafe to spray later than August 12, but the results would indicate that had we omitted the first spraying, and given another in the latter part of August, effective work would have been done." The first spraying immediately after the falling of the blossoms, seemed to accomplish little or no good, as "observations made for two weeks after the first spraying failed to give any indications of the moth's work in the fruit of either sprayed or unsprayed trees." The Codlin moth must behave differently in Oregon than in the eastern States. The summary of the season's work is as follows:—"1. Early spraying—just after the blossoms fall—is useless. 2. A mixture of 6 oz. of London Purple to 100 gal. of water is better than a stronger one. 3. The mixture should be kept thoroughly stirred while being used. 4. Young and vigorous foliage is more susceptible to injury by burning from the application of arsenites than is older or less vigorous foliage. 5. Spraying as late as September 1, or even later on winter Apples, is desirable as far as fighting the moth is concerned. (There may be some danger in such late spraying, however, and this is one phase of the subject for next

year's work.) 6. All fallen Apples that are affected should be destroyed daily. 7. The cost per tree for each spraying will average, in small orchards, about 3 cents. In larger orchards it would be less." *Bulletin No. 3, Oregon Experiment Station.*

Woolly Aphis.—Woolly aphis upon Apple trees was destroyed by a spray of lye-water—1 lb. of concentrated lye to 3 gal. of water. Kerosene emulsion was not found to be a satisfactory remedy. *Bulletin, Oregon Experiment Station.*

Fighting Codlin Moth in Iowa.—Mr. GILLETTE controlled a small and isolated plantation of Duchess Apples, upon which careful experiments were made with London Purple and water, Paris Green and plaster, and carbolic plaster. In every case treated trees gave better fruit than untreated trees. The poorest results were obtained from the use of carbolic plaster, there having been a saving of 33 per cent. of fruit liable to injury. "This remedy could hardly be recommended, even if very good results were obtained, as it does not kill the insect in any of its stages, but simply repels the moths, which seek the fruit of neighbouring trees, on which to deposit their eggs." Next best results were obtained from the London Purple, which saved about 80 per cent. of the fruit. One pound of poison was used with 128 gallons of water; some of the trees were sprayed once, and some twice. Best results followed the application of Paris Green and plaster. This saved 94 per cent. of the fruits liable to attack.

"I believe that no one has ever reported on a remedy for the Codlin moth, which, by careful counts, has shown as good results as this." One pound of Paris Green was used with 100 lb. of plaster. This was thoroughly dusted over the trees, from once to three times. Mr. GILLETTE thinks that two applications are ample. "Poisons cannot be applied by this method as rapidly or easily as by means of a force-pump, but it has the advantage of costing nothing for apparatus, and the trees can be dusted quite rapidly from a wagon, by driving on the windward side of the row. This method of applying the poisons would be especially useful where only a few trees were to be treated, and where it is thought that a pump cannot be afforded." These results with the dry poison are certainly remarkable, and they indicate that a distributing-machine like the lately perfected Strawsoner, of England, may yet find use and favour in our orchards. At all events, these experiments afford a new proof of the efficacy of arsenites in the combatting of the Codlin moth. *Bulletin No. 7, Iowa Experiment Station.*

THORN EMBEDDED IN A HORNBEAM.—Our sketch, fig. 114, represents the union of a Hawthorn with a Hornbeam, and was taken from a tree in Richmond Park, where we have known it for more than a quarter of a century. The Hawthorn twines round the Hornbeam, which has grown over the Thorn to such an extent that it is almost completely embedded in it. In the head of the tree the branches are intermingled, and in early spring the rich full green of the Hawthorn contrasted remarkably with the fawn-coloured tint of the Hornbeam. We have never seen a more complete junction than this—we can hardly call it union—as there can be no organic union between the two, nor any passage of sap from one to the other. CHARLES WATERTON satirically likened such unions to that between Church and State!

HOME CORRESPONDENCE.

EARLY STRAWBERRIES.—Apropos of what has been written in your columns during the last few weeks concerning Strawberry forcing, and the merits of the different varieties now in cultivation, perhaps you would kindly allow me to give my experience of a recent visit made to Glassingal, near Dunblane, N.B., and of the varieties grown there. Having been much interested in the forcing of this fruit for some years past, and last year, having heard how wonderfully successful Mr. McAra had been with his early Strawberries, I was determined to see them for myself, and find out what varieties were grown. I did not, however, expect to see such magnificent fruit so early in the year. Vicomtesse II. de Thury is here extensively grown, and grown to some pur-

pose; the number of fruit averaging two dozen to a pot—some pots had over three dozen, all of which were fit for the table. Laxton's Noble is also grown, is found to set freely, and the fruit shown me were really grand as regards size (one fruit measuring 7 in. in circumference) and appearance; but the flavour, in my opinion, is decidedly against it coming into general favour as an early forcing variety. Sir J. Laxton, and Owen's seedling are also grown, but are found not to be so vigorous as could be desired, and though the fruits of both varieties were fine, Mr. McAra is most in favour (for general forcing work) of Vicomtesse, the fruit on that variety weighing from 6 to 10 ozs. on each pot, and the flavour all that could be desired. Altogether Strawberry forcing is a success at Glassingal, and, like the other departments over which Mr. McAra rules, is well worth a visit, from which not only profit, but much pleasure, will be derived. *M. A. Chelsea.*

ÆCIDIIUM GLAUCIS.—The various heterocous Æcidia are one by one having their life-histories worked out. I am pleased to be able to report upon the affinities of the pretty little Æcidium which Mr. Peake found a few years ago, for the first time in Britain, upon *Glaux maritima*. Last August Mr. Peake, jun., conducted me to its original habitat on the banks of the Humber, a few miles from Hull. After a short search we were rewarded by finding a uredine upon *Scirpus maritimus*, which microscopic examination showed to be the teliospores of a *V. romycens*. These were carefully preserved during the autumn and winter, after the manner described in the *Yellow Book*, and at the end of April of this year were induced to germinate. Healthy plants of *Glaux maritima*, from near King's Lynn, where the Æcidium does not occur, were infected with these spores, and in ten days spermatogonia appeared, followed in due course by the Æcidium. The Uromycetes on *Scirpus maritimus* is distinct from the Puccinia of *S. lacustris*, and may conveniently be known as *U. maritima*. Mr. H. J. Sleight has found the same species this year at Cloppith, Lincolnshire, so that subsequent search will no doubt discover the Æcidium *glauca* at this place as well. *Charles B. Plowright.*

POWDERHAM CASTLE.—Mr. Powell, in his communication to your columns last week, mentions the Camellias in the open air at Powderham, some of which are nearly 150 years old, and were brought thither by Sir Joseph Banks, but he has never a word for the magnificent *Encalyptus coccifera* there, 62 feet high. All who have seen the tree would be glad to read yearly bulletins of its well-doing. It stands in what is perhaps the prettiest part of the Powderham Castle grounds, where a gentle little river laps a grassy sward trending upward to high Beech groves. This stream, dear to the herons, over which ancient Cedars of Lebanon cast long gaunt furrowed arms, has in full measure that peaceful face and bosom so dearly loved by Isaac Walton. By the planting of the sheltered sloping bank, Mr. Powell has increased the wonderful natural beauty of the place. One of his best ideas was to place the glancing light green of *Taxodium distichum* near a Purple Beech. *C. A. M. Greenwich.*

OPINIONS DIFFER.—I have recently had occasion to refer to descriptions of a large strong-scented Agaricus named *A. macrorhizus*. Fries, in his last work, says it smells like a corpse. Dr. Cooke, in his last work, says the "odour is like *Hilum aratum*!" Whilst in my own notes I find I have written, "smells like plum-cake"—"smells like a doctor's shop." *W. G. S.*

WIREWORM AND OILCAKE.—When pasture land is taken into a garden there is usually trouble from wireworms. A Primrose bed at Wisley was much injured by them. A good gardener told me that, if bits of oilcake were sunk in the ground, they ate and burst; and a great gardening authority said that it killed them. My gardener put a number in a box with some oilcake, but, so far, they seem none the worse; but it is a most effectual trap. Pieces about the size of a hen's egg, sunk 3 inches in the earth, with a stick to mark the place, and taken up after three or four days, will be found to have wireworms embedded in them, eight to twelve to a piece of cake. We have killed many hundreds. Old stagers know the use of oilcake, and gas-lime is said to be effectual, but with plants in the bed this would be dangerous. I think some of your readers may not know oilcake as a trap, and be glad to try it. *George H. Wilson.*

EAST LOTHIAN STOCKS.—Nowhere do East Lothian Stocks show to better advantage, nor are more useful, than in the herbaceous borders, which they brighten up during the months of May and June, and the perfume from them night and morning too is much appreciated by garden visitors. As a rule about half the plants obtained from a packet of seed produce double blossoms, which are usually better liked, and at any rate are more showy, being brighter, than the single flowered. The great point in the culture of these Stocks, when they are intended solely for flowering out-of-doors, is to get them thoroughly established in their flowering positions before the rains and frosts of winter come; especially is this the case where the garden is on heavy soil. In sandy and light soils, on the contrary, planting can be done at almost any time. It is well to remember that large plants will not bear replanting late in the autumn, and they seldom do any good when so planted. The best way to grow them in cold soils is to sow the seed in beds out-of-doors, during the first week in June, covering the seed with some finely sifted refuse soil from the potting-bench. Should the weather be dry at the time, it is a good plan to thoroughly water the soil the day before sowing, thereby assisting germination considerably; and instead of watering the beds in the case of continued drought, it is better to lay a mat over the bed, and fastening it down, as watering the soil usually causes caking and cracking of the surface. Directly the plants are large enough to be handled, they should be transplanted to the position in which they are to flower, choosing a showy day for the work, Stocks being impatient of drought and bright sun, whilst being removed. I find that this method is much better than that of pricking out the seedlings into beds for awhile, before finally transferring them to their flowering stations. In cottage gardens the Stock is often seen in capital condition, which is mainly owing to the fact that the plants obtain a long season of growth in the spot they are to flower in, as seldom indeed do they get pricked out from the seed-beds preparatory to final planting, often being set down in the place they flower in. I send a few spikes of bloom for your inspection from our plants, some of which measure 2 feet across and are covered with blossoms, with this note. *E. Molyneux.* [Beautiful spikes of these fragrant flowers, of varied colours, pure white, crimson, pink, purple, and others. En.]

CHOISYA TERNATA. It cannot be generally known that this beautiful shrub will thrive outside in many of the south and south-eastern counties, or surely we should meet it more frequently than is the case at present. Fig. 107, p. 645, of *Gardeners' Chronicle*, gives a good idea of the flowers and leaves. In planting where the climate is somewhat ungenial, it should be trained to a wall in a sheltered spot. In these gardens it flowers and grows vigorously planted against a wooden fence in rather an exposed westerly aspect, and the dark green foliage generally becomes a little tinged in consequence during winter. Plants are very serviceable for greenhouse or conservatory decoration, especially when young and vigorous. They should be potted in good rich loam, and turned outside to ripen their growth during summer. Cuttings taken now or later on root readily if placed within a close case. It is a member of the Rue family, and grows some 6 feet in height. Native of Mexico. *W. Harrow, Cambridge.* [Near London it was killed even on a wall in the last severe winter. Ed.]

—The illustration given in the *Gardeners' Chronicle*, p. 645, faithfully represents this spring-flowering shrub, which is equally good either under glass or out-of-doors. Perhaps the best place for the plant is at the foot of a south wall, and in such positions the largest quantities of flowers are obtained. It is not particular as to the kind of soil in which it grows, but some manure should be added at the time of planting, to promote freedom of growth, and its consequent profusion of flowers. The great point is to have the wood thoroughly ripened, and unless this is effected, abundance of flowers are looked for in vain. In some kinds of soil the foliage is of a pale green colour, but a few applications of liquid manure will deepen their colour—a decided gain at flowering time, as affording a better contrast to the flowers. If the growth is allowed to grow unrestrained, a much better effect is produced than when it is close trained, the trusses of blossom showing to greater perfection. Low bushes of *Choisya* planted in the front parts of the shrubberies in sunny places look well when in

flower. We have the plant covering a wall in an unbeat corridor, and nowhere else does it show to more perfection. The leaves are of a dark tint of green, owing to the liberal quantity of manure that it receives. In the early part of last April this plant was covered with its sweet-scented blossoms. As a vase flower it is much admired. Shoots 1 foot long are sometimes made in a season, and, owing to this rapidity of growth, it is a valuable plant for covering a bare wall in a short time. Grown in 6 inch pots, nice bushes may be obtained which are useful decorative objects in March and April. The great points to pay attention to are that the plant makes substantial growth after flowering, and these are well ripened out-of-doors. Cuttings of the half-ripened shoots strike freely in a gentle bottom-heat during June, and, as the young plants grow, the points of the shoots should be pinched out to induce bushiness of habit. In a pot the roots are liable to get unduly dry if abundance of water be not given to them, and this attracts red-spider. *F. M.*

BOTANICAL FIGURES—I have been lately, for purposes of teaching, procuring a number of elemen-

tary botanical books. There must, of course, be a great sameness in the figures, but it is a little just quiet enduring that nearly every one should have the same woodcuts as Sachs and Prantl. A great number of the figures are subscribed "after Prantl," whereas the true description should be the same as Prantl. One book, the cost of which was 6s., with an attractive title, had not an original illustration in it. When there is such great similarity in the treatment of the subject, publishers should be liberal enough to provide original illustrations and figures. It must cramp an author to write up to old illustrations. *C. J. M. C.*

DORONICUM PLANTAGINEUM EXCELSUM.—I fully endorse what Mr. Sheppard says (p. 377) regarding this being one of the best early-flowering hardy plants, and deserving of being planted in every garden, though I cannot agree with him in

would try May planting in good rich ground, and see the difference between the handsome flowering of well-established clumps against those only divided a week or two prior to the expanding of the first blossoms, he will receive a most pleasant surprise. *E. Jenkins.*

ONIONS AT THE VEGETABLE CONFERENCE.—Possibly an "Enquirer" was not present at the Vegetable Conference, held at Chiswick, nearly six months since, or he would, if he then saw reasons for objecting to the Onion selections of the censors of those bulbs, have at that time raised the complaint he has just now made. On the other hand, it is possible that, having seen the samples of the various sorts of Onions referred to as selected types, he would have understood that the selection was due to fine appearance of the samples in question, and that, in so regarding them, there was no intention to exalt those so specially mentioned above other popular standard varieties. It is doubtless the case that "Enquirer" did not attend the Conference, and I draw his information, as well as his conclusions from the report of the Conference, undoubtedly excellent in its kind, so tardily issued in the *Journal of the Royal Horticultural Society*. The censors, who so kindly undertook the labour of classifying the various vegetable exhibits, were specially requested to select the best samples in the various sections as types, and to classify all others as nearly approaching to those select types as possible. Onions vary so much in shape, and yet in many cases so infinitesimally, that it is very difficult in some cases to say whether a variety is really round or flat, but there is a distinct line to be drawn between flat and oval, or globe-shaped. Ailsa Craig is the very finest of the globe-shaped forms yet produced, and the samples shown at the Conference justified such selection. It is true they were produced under exceptional methods of culture, and some other older globe forms, such as Excelsior, James Keeping, and others might, if so specially treated, do nearly as well. However, the Conference censors took the finer examples before them, and of the Globe type they found them in Ailsa Craig. Precisely the same may be said of the Anglo-Spanish variety as a fine select flat type; although I prefer Rousham Park Hero as a model flat Onion. Still, the first named is a flat Onion, if a little deeper in the bulb than the other. Possibly this distinction explains a further criticism made as to the classing of Giant Rocca with flat Tripolis. The difficulty seems only to be got over by having sections of flat, round, and oval; but the distinctions in some forms must be exceedingly minute indeed. With respect to Certificates, the instructions of the Conference committee to the censors were, that certificates were to be awarded to all samples showing excellence of quality or cultivation. The Certificate might in some cases have been granted to sort, but it was specially desired it should be granted to quality as found in the exhibit. The chief object of the Certificate was to reward exhibitors for cultural excellence, but the award was intended for the sample only, and was not given because shown by this or that individual. "Enquirer" admits that upon this supposition the awards were comprehensible. Just so. Further, it is hoped they were comprehensive, and that no meritorious sample was overlooked. It is to be deplored that soon after the Conference the committee were not called together to discuss methods of improved action in future vegetable conferences. To have done so when the whole subject was fresh in our minds would have proved most useful; now nearly all suggestions are forgotten. There is no practice like striking whilst the iron is hot. *A. Donn.*

PLANTS THAT REQUIRE A MOIST AIR.—It is a common complaint amongst gardeners that here, in the south, Polyanthus, Violets, Primroses, Violets, Iris Kämpferi, and Pansies, will not grow with the same degree of vigour as in the northern parts of Britain, and this is very properly laid to the greater amount of heat by day, and the drier air prevailing. As a matter of fact, the sun is longer above the horizon in northern parts than in southern, and the accumulated heat of the longer days has a marked influence on vegetation, the growth of plants being very rapid; but owing to the deep inlets of the sea on both sides of the country, and its many lakes and tarns, the moisture taken up by the sun is considerably in excess of what occurs in the south. In a small way we might imitate this moisture-laden air about such of our plants as suffer by the want of it, by having some kind of device for holding water for evaporating

FIG. 114.—IRON ENGRAVED IN HURSTMAN, IN REDWOOD PARK. (SEE P. 682.)

saying it is about 15 inches high, for with ordinary cultivation it will grow fully twice that height. When well grown the plant attains 3 feet in height, and its individual blossoms are fully 4 inches across. This is its behaviour in our light, well-drained soil; but in moister and stiffer soils it grows still stronger. It is without doubt one of our very best perennials, and an excellent subject for large beds. The dwarfier forms, *cf.*, *austriacum*, *Christi*, and *caucasicum* are even taller than Mr. Sheppard has stated *D. excelsum* to be. This plant (*D. excelsum*) commences flowering early in March, therefore I do not consider early spring the best time for replanting it, as notwithstanding its accommodating qualities, the operation would not improve its flowering. To do it justice, it should be divided and replanted either in early autumn, or better still, from the middle to the end of May, after its first flowering is past. I much prefer the latter time, as finer plants and abundance of handsome flowers result. The height given by Mr. Sheppard is, no doubt, the result of dividing and replanting at an improper moment, thereby sacrificing at least one half its grandeur. I think if your correspondent

LILY OF THE VALLEY.—We have been gathering large quantities of this flower for the last week or two, and which have not had the least protection whatever; some of the spikes have carried as many as twenty-two bells. I do not mention this as anything extraordinary, but simply to persuade any who may be growing the old English variety not to do so, but to get some of the strong crowns, so much advertised, at the proper time—say, from November to April. Any who may have crowns that have been forced, either

ends. We do it in the case of filmy Ferns, Orchids, &c., under glass, and we could also improvise something in the open air. I would suggest that around clumps of those plants which suffer from dry air, to make shallow channels of puddled clay—say, 7 or 8 inches wide—or place among them broad garden-saucers, or half-round drain pipes made water-tight at the joints with clay or cement. These devices might be kept filled with water, which would entail but little extra labour, and this little would be readily undertaken by the florist who was an enthusiast; and what florist is not? Whatever is employed as a water-holder should for appearance sake be sunk to the rim in the soil, and should only be allowed to get partially hidden with the foliage; and when autumn arrives, be emptied or cleared away. A. T. E.

SOCIETIES.

ROYAL HORTICULTURAL.

The show held in the gardens of the Inner Temple on Wednesday and Thursday, May 28 and 29, was, to a large extent, a repetition of the fine show held in the same place last year, and worthily fulfils the promise then made.

Both days were fine, not unpleasantly warm, and visitors were numerous in consequence. His Royal Highness the Prince of Wales arrived punctually at 1 P.M., and, accompanied by Sir Trevor Lawrence, the President of the Society, Baron Schroder, members of the Council, and other gentlemen, made an inspection of the various tents in which the exhibits were displayed, and, after listening to a short address on the work, aims, and claims of the Society (see p. 680), made an appropriate reply, and declared the exhibition open.

THE ORCHIDS.

As anticipated, a magnificent display of these was got together, the centre of the large tent set apart for them being entirely occupied by these royal plants, while the sides were decorated with groups, in which the Orchids were the leading feature. Facing the entrance a gigantic specimen of *Cymbidium Lowianum*, with twenty-nine finely developed spikes, from Baron Schroder's collection, gave the visitors a noble example of what an Orchid could attain under such culture as that which Mr. Ballantine gives to the Dell collection. Continuing down one side of the centre staging were Baron Schroder's grand exhibits, all of the highest order of merit: Cattleyas, *Laelias*, and *Odontoglossums* especially fine, and among the last named some phenomenal varieties of spotted *O. crispum* of the apiatum and Veitchianum class. Among these also were some beautiful forms of *O. Andersonianum*, a very large *O. excelens*, and among other species that splendid form *O. Hallii magnificum*, with its ample-spotted labellum; *O. H. leucoglossum*, *O. Schillerianum*, the fine white and purple *O. ramosissimum*; the forms of *Mitonia vexillaria* also were good.

Among the Cattleyas were a richly-coloured *C. Skinneri* with over forty spikes, and many superb Cattleya Mendelii, the beautiful *O. M. Rothschildiana*, one of the best; also a delicate pale rose coloured variety of *C. Lawrenceana*, named *delicata*. Of *Cypripediums*, Mr. Ballantine staged many good specimens, such as *C. selligerum majus* ×, with sixteen flowers, *C. marmorolobium* ×, *C. Lawrenceanum* *hyeanum*, that rare albino, if we may give the term to a flower with so much pale green in it; Cattleya Lawrenceana, the richly-coloured *Masdevallias*, and *Dendrobis*, also showed prominently in the Baron's group, which, like most of the other exhibits, were well arranged with Palms and Maidenhair Ferns, and in it, too were many things of botanical interest, such as the very curious *Sarcopodium Dearei*, with its hinged labellum.

Next came the display sent by Sir Trevor Lawrence, Bart., M.P., the President of the Society, and in importance it seemed equal to that from The Dell. Curious plants are always in force in the Burford collection, and among the more massive and showing things the curious little *Bulbophyllum bargerum*, with its father-like labellum, sensitive to the slightest breath of air, attracted its full share of attention. *Dendrobium revolutum* is another curious species with ivory white flowers, and among the group were many rare plants, which could only come from Sir Trevor Lawrence's collection. Here the specimens

of *Cypripediums* were large and well bloomed; *C. Swainianum* × had sixteen flowers, and *C. Lawrenceanum*, *C. superciliosum*, ×, *C. selligerum majus*, and others were equally good. The Cattleya Lawrenceana, *C. Mossii* *Masangeana*, and *C. Mendelii* were well represented, and also a plant of the rare *C. Schroderiana*, a supposed hybrid; and among the glowing collection of *Masdevallias*, we noted *M. Shuttleworthii*, *M. xanthocorys*, and *M. Gelengianum* ×, the latter with curiously twisted tail-like appendages. *Thunia Benzonie* and *T. Marshalliana* were also finely exhibited, and the pretty *Bifrenaria Harrisoniae* *Buchaniana*, *Dendrobium Jamesianum*, with fifteen flowers on a stem; many fine *Odontoglossums*, and two potulids of the curious brown native parasitic Orchid, *Neottia nidus-avis*.

H. M. Pollett, Esq., of Fernside, Bickley, staged a good group, in which the *Odontoglossums*, both species and hybrid, were remarkable. A few of the rarest were *O. crispum* *Bickleyense*, with cream-white flowers, heavily blotched with brown; *O. elegans*, an *O. cirrosum* hybrid, and the same noble form of *O. Hallii magnificum* as that seen in Baron Schroder's collection. There was also a fine example of *O. Corradinei*, an *O. Oerstedii*, with forty flowers, and the best form of *Cypripedium Sanderianum* we have seen.

T. B. Haywood, Esq., Woodhatch, Reigate (gardener, Mr. Salter), had a beautiful arrangement of Orchids with Maidenhair Ferns, his forms of white and blush *Odontoglossum* being the best in the show; so also his *O. Pescatorei*, with three fine spikes; these were well set off with specimens of scarlet and purple *Masdevallias*. Mr. Haywood also had a grand example of Cattleya gigas with five flowers on a spike, and a lesser plant of *Odontoglossum Harryanum*, both of these we believe the only representatives of their kind staged at this show.

From the Duke of Northumberland's gardens, Syon House, Brentford, Mr. Wythes staged a group in which numerous plants of the best form of *Cypripedium barbatum* were conspicuous, also some good *Anthurium Scherzerianum* and the fine old *Oncidium spheculatum*; and F. Wigan, Esq., Clare Lawn, East Sheen (gr. Mr. W. H. Young), had a pretty arrangement, in which, among many handsome Cattleyas, were a fine form of *Vanda teres*, some good spikes of *Phalenopsis*, *Acrides Fiedlingii*, *Cypripedium Dayanum*, and *C. Curtisii*, and plants of *Laelia maialis*, each bearing several large flowers, all the more welcome for that they are seldom seen.

Returning by the other side of the centre staging occupied by the nurserymen's exhibits, we found a princely display, extending some 40 feet, from Messrs. F. Sander & Co., all the things usually seen at this season being contained in it, and many of them very large specimens. Among the new or rare species in this group were *Mitonia Bleu splendens* ×, a hybrid between *Vexillaria* and *Roelzii* white with central lake lines. The characters of the two parents were well combined. The general appearance of the flower is that of *Vexillaria*, but the markings those of *Roelzii*, a really pretty thing; *M. vexillaria* *Fairy Queen*, a charming pure white, with lemon centre, certainly unique and lovely; Cattleya Mendelii *Prince of Wales*, of fine shape, and with the richest glowing crimson lip which has appeared; *Odontoglossum excelens* *Prince Albert Edward*, with distinct labellum blotched with red. *O. crispum* *Youngii*, white, spotted thickly with brown and a yellow spotted hybrid named *O. c. Rothschildianum*. Also remarkable in Messrs. Sanders' group were large specimens of the pretty *Thunia Humboldtii*, and its variety *P. H. nidi*; a fine *Vanda saavis*, with twelve spikes; *Dendrobium Dearei*, with fifty or so; *Laelia grandis*, with a dozen; *Laelia purpurata*, with over thirty flowers; *Ornithocephalus grandiflorus*, *Acrides Sanderiana*, several large *Dendrobium thysiflorum*; *Oncidium roaimense* of the sessile group with a number of bright yellow flowers, the petals and sepals having a few pale brown spots, Cattleya Wagnerii, and *Calanthe vestita gigantea*. A *Cypripedium* named *Volonteum* was also shown, it greatly resembles *C. Hookeri*, but the petals are broader and spotted, the lip large and greener. In Messrs. Sanders' collection also was the new white *Anthurium album maximum*, one of the finest and latest efforts of M. de la Vevanoye of Angers; the spathe is large, creamy white, with a red tip.

At the other end of the staging, Mr. Cypher, Exotic Nurseries, Cheltenham, had a similar display, notable for the large size and excellence of the varieties of *Laelia purpurata*, the white one with two purple blotches on the side lobes of the labellum being superb, and *L. p. gigantea* and another

dark one very distinct. Some standards placed in front of Mr. Cypher's group were hung with *Dendrobium Benzonie*, D. Falconeri, &c., and were very effective; among the D. Falconeri being one of the first variations of the species known—D. F. *delicata*. *Dendrobis* were fine in this collection—D. *Dalhouseianum*, D. *Parishii*, D. *Devonianum*, D. *Benzonia alba*, &c., and Cattleyas and *Odontoglossums* exceptionally good.

From Messrs. Hugh Low & Co., Clapton Nurseries, a very extensive, varied, and interesting collection was staged, the centre occupied by a yard or so of plants of the beautiful leaved *Anaethochilus Lowii*, backed by noble plants of *Cypripedium Lawrenceanum*, *C. Elliottianum*, *C. hirsutissimum*, *C. Godenroye*, *C. caudatum*, *C. bellatum*, &c. Here were many spikes of *Phalenopsis gloriosa*, *P. amabilis* and other species, *Vanda cernuensis* *Boxallii*, plants of their fine strain of Cattleya *Mossii*, *C. Mendelii*, &c.

Mr. G. T. White, of Winchmore Hill, also staged an effective group, with a plant of the rare *Amaryllis solandraeflora conspicua* in the centre, a large *Laelia purpurata*, and many other good Cattleyas and other Orchids.

Grouped on the grass at the side of the tent was an extensive display made by Messrs. B. S. Williams & Son, of Victoria and Paradise Nurseries, Upper Holloway; prominent were the species of *Vandas* for which the firm is noted; also *V. Denisoniana* and *V. teres* *Aurora*, a pretty blush-white form. That fine old show plant *Calanthe veratrifolia* also showed up well in Mr. Williams' group, and *Calanthe Williamsii*, *Agulosa Clowesii*, some finely-coloured *Masdevallias*, some large *Oncidium colorol*, *O. selligerum*, *O. macranthum*, *Odontoglossum citrosium*, *Epidendrum vitellinum*, *Laelia cinabarinata*, *Masdevallia Veitchii*, with thirty flowers; *Cypripediums*, Cattleyas, and other species were effectively displayed.

Mrs. Studd, Royal Crescent, Bath (gr. Mr. Geo. Cypher), also sent a new lavender-coloured form of *Sobratia macrantha*, very pretty, and *Dendrobium MacCarthiae*, well-bloomed; and good Orchids also appeared in the groups of Messrs. John Laing & Sons and Mr. Feely, and beside their fine collection of Filmy Ferns, Messrs. James Backhouse & Son exhibited a fine example of the handsome rosy-red *Disa racemosa*.

THE FERNS.

Seldom has it fallen to the lot of visitors to a flower show to see such a superb collection of Filmy Ferns as that sent by Messrs. Jas. Backhouse & Son, of York—the only firm, indeed, who could send anything like such a collection. There were about one hundred specimens, and over fifty species, and of the plants being 2 feet or so across, and all invested with that peculiar charm and additional attraction which beautiful plants rarely seen cannot fail to possess. It is no small matter thus to exhibit these plants, many of which are unique, and some of them representing the growth of twenty-five years; some, indeed, if lost, could not possibly be replaced. Looking through the collection, we were much impressed by the beauty of all, but especially by the large masses of *Trichomanes Luschathianum*, 3 feet in height on Tree Fern stems, and its priceless variety, *T. L. prelongum*. *Trichomanes Borneense* is a very handsome species, and the Killarney Fern is represented by several varieties, ranging from the largest form of *T. radicans* to the pigmy *T. r. alabamensis*, a neat little gem of a plant. *Trichomanes meifolium* is a noble species, with the habit of *Todea superba*; *T. reniforme* here appears 2 feet across, *T. venosum* has cut foliage like some of the seaweeds. *T. v. superbum* is a Trinidad species of stately form, and *T. pyxidiferum* of elegant growth. Among the *Hymenophyllums* the range is equally wide, from the hair-like fine divisions of some of the tropical representatives of the *H. tunbridgeense* section to the more ample frondage of the *H. demissum* class, which approach to the Killarney Fern in size. Among them we noted as specially attractive *Hymenophyllum dilatatum*, *H. demissum*, *H. obtusatum*, *H. scabrum*, *H. bilabiatum*, *H. magellanicum*, and other fine species. To the entire collection too great praise cannot be given, for while giving a great treat to Fern lovers, they could not fail to attract great attention from all visitors by reason of their exquisitely arranged frondage and general uncommon appearance.

Messrs. W. & J. Birkenhead exhibited in that excellent manner peculiar to the firm whenever they are favoured with their presence in London. They staged some 500 specimens, embracing a fair representation of each class, and also of Ferns generally.

The group was arranged in sections as much as possible—the *Adiantums* together, the *Aspleniums*, *Gymnogrammas*, and other large genera placed conveniently for comparison; the exotic species together and the hardy kinds at the end. Among the hardy we noted the elegant *Anthurium plumosum elegans* and *A. f. f. Frezelli cristatum nanum*, *A. f. m. fimbriata cristata*, elegantly fringed and crested; the *Scelopendrium cristatum* and *grandiceps* were remarkable, and the well-known but pretty *Asplenium septentrionale* and *A. germanicum* were among the dwarfest. Among the exotics were a group of all the species of *Lygodium*, and the allied *Lygodictyon Fosterii*; a fine lot of *Cheilanthes* and *Nothochlaenas*, some of the new *Oxychium aurati* m., *Lomaria fluviatilis*, *Davallia parvula*, and a group of *Filmy Ferns*, including the new *Todea grandipinnula*.

Mr. H. B. May, of Edmonton, occupied the other side stage with an equally extensive lot of Ferns, effectively set up with coloured *Crotos*, *Dracenas*, &c., the Ferns being chiefly those adapted for market work, a question which Mr. May is well qualified to settle.

big clumps than when too much mixed. The pure white *Lupinus grandiflora alba*, and the pretty dark blue and white *Foxi*, were very pleasing. Of the *Delphiniums*, *Autolycus*, semi-double, large and rich violet, was striking. A rich carmine single *Pyrethrum* was seen in Clemence, and a good double white in Carl Vogel. A few very good *Amarillis* were included with the general collection. Following these came a remarkably light and pleasing group, staged by Messrs. Barr & Sons, King Street, Covent Garden; these were much less formally grouped, and presented a most varied and attractive assortment; *Paeonies* in variety, double and single *Pyrethrums*, *Poppies*, including the pretty *Icelandic form*, *Irises*, *Lupins*, *Aquilegias*, *Ixias*; *Asters*, including a large mauve-coloured one named *Alpinus speciosus*, also shown by Mr. Ware, with many other interesting and pleasing if less effective flowers, made up this collection.

On the opposite side, Mr. T. S. Ware, of Tottenham, made a brave show; *Papaver orientale* and *bracteatum*, standing out in clumps with fine effect;

superb flower, some large bunches of *Dodecatheon Meadia elegans*, various early *Gladioli*, &c., made the collection one of exceeding interest. In the same tent, Messrs. B. S. Williams & Sons, Holloway, had a big collection of *Ixias*, and Messrs. Cheal & Son, Crawley, had a small lot of hardy flowers in variety.

One of the most striking exhibits was a huge tuft of *Puya chilensis*, from the Abbey gardens, Treco, Scilly Islands. The leaves are like those of an *Agave*, and from their centre rises a tall flower-stalk, terminated by a dense head of flowers of a lovely shade of blueish metallic-green, which defies description in words, and which could not be exactly matched in any colour-box, nor reproduced by any artist. This beautiful plant is a native of Chile, and is one of the *Bromelia* family, allied to the *Pine-apple*. Our illustration (fig. 115) represents the plant as growing out-of-doors in the Scilly Isles. This and similar species may be seen in the Succulent-house at Kew.

Hardy Shrubs.—With these Messrs. J. Veitch &

FIG. 115.—*PUYA CHILENSIS*.

Among the varieties staged were several forms of May's Crested Pteris, also their *Davallia exaltata plumosa*, and the *N. rufescens tripinnatifida* of Messrs. Veitch; *Nephrolepis davallioides furcans*, and other *Davallias*; *Lastrea lepida*, a collection of *Gymnogrammas* and *Nothochlaenas*, and some rare *Davallias*, such as *D. ornata*, the whole arranged in a careful manner.

HARDY FLOWERS AND SHRUBS.

Lovers of hardy border flowers must have revelled in the wonderful wealth of these furnished to them in the various tents. They presented probably the finest display of their kind seen at any similar show in London. Where all were so good, as well as so varied, it is not for us to determine precedence, but the largest exhibitors, perhaps, were Messrs. Kelway & Sons, Langport, Somerset, whose flowers, set up in masses in large boxes, staged three deep in one of the long tents, made a show of colour difficult to excel, backed by *Giant Poppies*, *Irises* in variety, double and single *Paeonies*, *Lupins*, and *Delphiniums*, with in front myriads of double and single *Pyrethrums*; the effect was very striking, and showed how much more telling hardy flowers are in

with these were grouped in good quantities large crimson, red, rose, white, and other various coloured *Paeonies*, in rich profusion; clusters of white perennial *Lupins*, *Anthericums*, *Spiraeas*, double white *Narciss*, with an infinite variety of *Aquilegias*, *Centaureas*, *Pyrethrums*, the pretty mauve *Aster alpinus*, various *Japan Primulas*, *Erigerons*, and many other charming flowers.

The very pretty group from Messrs. Paul & Sons, Cheshunt, included a cluster of the orange-red *Geum minimum*, some noble *Solomon's Seal*, *Trollius japonicus plenus*, *Ranunculus acris plenus*, *Island Poppies*, beautiful *Violas*, set up in spray fashion, *Pansies*, *Paeonies*, among which was *P. conchiflora*, which seems to be the same as *P. lobata*, and with these a wealth of other flowers, as previously mentioned. With the group was a further one of hardy alpine and rock plants, in pans, amongst which were *Dianthus alpinus*, the white and blue *Ranondias*, creeping *Phloxes*, *Thrifts*, and other pleasing flowers. In the fruit tent, Messrs. Jas. Veitch & Sons, Chelsea, had a somewhat formal but wonderfully telling collection of hardy flowers in big lots. *Ixias*, *Irises*, *Paeonies*, *Poppies*, *Ranunculus*, in wondrous profusion and

Sons made in the large tent a delightful group, one that could for beauty well compare with those produced by house plants. Here were standard *Rhododendrons*, beautiful *Azaleas*, pretty *Acers*, *Hydrangeas*, the charming *Clethra alnifolia*, *Spiraea astilboidea*, *Cercis Siliquastrum*, big baskets of *Gladioli*, all fronted with boxes of *Rhododendrons*, making a beautiful collection. Very striking, also, were the *Rhododendrons* from Messrs. Lane & Sons, Berkhamstead, which suffered somewhat from being in a dull corner, but the plants were well bloomed.

Quantities.—Grandly flowered plants of these came from Messrs. R. Smith & Co., Worcester, fine specimens, ranging from 3 to 4 feet high, and as proportionately thick, all superbly flowered. Very striking were *Sensation*, *Madame Lefebvre*, *Excelsior*, and *Duchess of Norfolk*. These were one of the striking features of the show, having some of the fine old specimen plant form, as well as superb quality of bloom, to render them specially attractive.

Rhododendrons.—From Messrs. W. Paul & Sons, Waltham Cross, came a striking collection of cut blooms of *Rhododendrons* in great variety, all the best forms in commerce and at present in bloom being represented. With these also were trusses

of seeding *Azalea mollis*, the rich red and orange tints of which were very beautiful, and were in striking contrast to the deeper hues of the *Rhododendron* flowers.

FLORISTS' FLOWERS, &c.

Only two groups of *Calceolarias* were furnished, the one staged in the big tent being from Farnham Royal, and the other in a long tent from Swanley. Mr. James, whose reputation for *Calceolarias* has never faded, exhibited a large number of fine plants grandly bloomed, some indeed having flowers of such inordinate size, and yet fully expanded and well-proportioned, that they measured fully 5 inches round. The colours and markings were intensely rich and varied, whilst habit was all that could be desired. Mr. Cannell had more plants also of a dwarf and compact strain, all very pleasingly bloomed, but the flowers were not of unusual size. Both collections were greatly admired.

Messrs. Cannell also showed a collection of *Begonias* of much merit, and in a great variety of colours. Yellows came out well, too; a variety named Rev. W. Wilks was striking—it is a double flower, of good form, rose colour, and a darker Picotee edge; D. T. Fish, bright rose self, full double; and Lady Blanche Baillie, old gold shaded, is a single flower of a good order; Primrose, a pale yellow, single, is also distinct.

Another lot of tuberous *Begonias* was from Messrs. J. Laing & Sons, Forest Hill, S.E., this firm's plants being most attractive, and many worthy varieties were included, among them being *Enchantress*, scarlet carmine, with a pure white eye, single; *Leviathan*, measuring 7 inches across, rich rose—a large flower, but lacking form; which, however, is got in *Gigantea*, a flower more of a pink colour, and a little smaller; *Henshaw Russell* is a rich scarlet double; and *Negro Boy*, a dark red double, of moderate size, the guard petals prominent; *Duke of Edinburgh*, a somewhat old variety, rich carmine-red, is one of the best yet; *Juarazzi* is a rich carmine-red single flower of fairly large size, with undulate petals and sepals quite distinct and novel.

Mr. Rupert Miller, of Shoreham, set up a group of a pure white regal *Elargonium*, said to be a sport from Madame Thibaut. It was very good in the group, but individually not equal to the best varieties. It was named Pearl. Beside this group was placed, in striking contrast, a quantity of the lovely blue-flowered *Leschenaultia biloba* major from Messrs. W. Balchin & Sons, Hassock's Gate, Sussex. This blue bank attracted considerable attention, and most deservedly so.

Pelargoniums were not numerous. Mr. F. Perkins, Leamington, sent two decorative varieties, named *Princess Beatrice*, a blush flower, and very effective; and *Prince Henry*, rosy-carmine, with white edge and eye. However, a grand lot of specimen plants came from Mr. C. Turner, Slough, show, large and decorative all being shown. There were well-flowered examples of *Rosy Morn*, *Rosetta*, *East Lynne*, *Phyllis*, *Gold Mine*, *Madame Thibaut*, *Maggie*, *Excellent*, *Lady Isabel*, *Fireball*, and *Madame Marie Knecht*. Mr. Turner also had a few *Carnations*, including *Ellen Burrows*, a flower of a pleasing rosy-salmon tint.

Messrs. Dobbie & Co., of Rothesay, Scotland, staged a very good collection of *Pansies* and *Violas*, showing about 100 bunches of bloom, and 20 plants in pots; the *Viola Duchess of Fife*, very pale yellow with a mauve edge, is distinct and novel; *Ada Adair*, claret, with a dark eye; *York and Lancaster*, mottled mauve, purple, and white, were also noticeable, while *The Mearns*, *Countess of Kintore*, and *Archibald Grant* are worthy varieties. The fancy *Pansies* were also showy. Mr. F. Hooper, Bath, was another exhibitor in this class, and Messrs. H. Cannell & Sons also had a few samples, both firms making a satisfactory display. Messrs. Chambers, Isleworth, showed a bank of their white bedding *Viola Snowflake*, backed by *White Swan* *Pilox*, an early free-flowering variety of much merit.

The display of *Gloxinias* made by Messrs. Sutton & Sons, Reading, was very showy; the vigour of the strain being well illustrated by the varieties shown; there were about a hundred plants, of which we select *Her Majesty*, pure white, with just a trace of pink; *Princess of Wales*, delicate shaded rose, white tube; *Prince of Wales*, carmine, with white outer band and throat; *Empress of India*, violet-purple; and also the new netted strain, the colour of the lobes of the corolla being netted with white.

A smaller lot, and the plants of a more dwarf habit, and having more bloom, was that shown by Messrs. J. Veitch & Sons; a great range of colour

was embraced, and the reds were specially noticeable, and mostly so the new variety, *Mrs. J. Donaldson*, intense scarlet-carmine self.

GROUPS.

The most important item under this head is the groups of *Roses*. Messrs. Paul & Son, Cheshunt, Herts., contributed a collection of capitally-flowered specimen pot plants of popular varieties, such as *Juno*, *Charles Lawson*, *Her Majesty*, *Cheshunt Hybrid*, *Centifolia rosea*, *Merveille de Lyon*, and *Madame de Watteville*. Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, N., set up a charming and novel arrangement. He had fourteen plants of *Niphetos* well laden with flower, arranged so as to form a semi-circular group backed by *Palms*, and edged with *Adiantum*, *Pandanus Vetchii*, &c.

Messrs. W. Paul & Son, Waltham Cross, Herts., had an extensive collection of *Roses* numbering about forty pot plants, and a dozen boxes of cut blooms in addition. This was a highly attractive display, and embraced some of the best varieties. The plants were of medium size. *Merveille de Lyon* was shown in abundance, and others were *Marie Finger*, *Alfred Colomb*, *François Levat*, *Albert de Blotais*, *Queen of Queens*; and of cut blooms in addition, *Garden Favourite*, *Madame G. Luizet*, *Mabel Morrison*, *Crown Prince*, *Senateur Vaisee*, and *Margaret Niel*.

Messrs. J. Laing & Sons had a carefully-arranged and effective group of various foliage plants enlivened by the admixture of a few *Orchids*, *Orontoglossum* and *Laelia purpurata* chiefly, and also plants of *Lilium Harrisii*, and *Saxifraga Macanabiana*, with flowers of white with rose spots.

The fine specimen *Palms* seen last year were absent from this display, but Mr. Jeeton, Putney, showed a number of grand plants of *Kentia Fosteriana* arranged with *Dracaena Lindenii*, *Eurya catifolia variegata*, and a few flowering plants.

A group of a dozen specimen plants of *Caladiums* was staged by Mr. C. Simmonds, gardener to F. W. Wiltshire, Esq., South Norwood. The plants were of fairly large size and in capital condition. *Ludde-mannii*, *Mrs. Laing*, *Candidum*, and *Triumph* of the Exposition being the best represented.

Messrs. J. Peed & Sons, Rouppell Park, S.E., had a large lot of *Anthurium Schezerianum* and varieties, with a few *Sarracenias*, not arranged with the greatest display of taste. One variety of *Anthurium* was noticeable for its large spathe. Mr. Pettit also sent an example of *Anthurium* having *A. Andreanum* with five spathe.

A collection of specimen *Palms* and greenhouse decorative plants, such as *Azaleas*, *Aphelexis*, *Dracenas*, *Metrosideros floribunda*, *Darwinia*, and *Leschenaultia biloba* major, were contributed by Messrs. W. Cutbush & Son, Highgate, N.

FRUIT AND VEGETABLES.

The exhibits in this section were not numerous. Perhaps the most noteworthy was the collection of fruit and vegetables in market baskets, as received for sale, Mr. G. Munro, Covent Garden, being the exhibitor. There were fine *Strawberries*, *Figs*, *Grapes*, *Tomatoes*, *Beans*, *Peas*, *Mushrooms*, *Melons*, and *Cucumbers*.

Messrs. J. Veitch & Sons, Chelsea, sent a collection of about forty dishes of *Apples*—very fine examples of late keeping, and all solid and plump, *Annie Elizabeth*, *North End Pippin*, *Ribston*, *King of Tomkins's County*, *Melon*, *Barnack Beauty*, *Alfriston*, *Rymer*, and *Harvey's Wiltshire* *Defiance* being among the best. A Pig called *St. John*, of much merit, was also shown—the habit is compact, and the fruit is borne well on the old wood.

A collection of *Apples* of about the same extent was staged by Messrs. G. Bunyard & Co., Maidstone, the fruits being in fairly good condition, *Bess Poet*, *Calville Rouge*, *Belle Dubois*, *Lane's Prince Albert*, *Cox's Orange*, *Newton Wonder*, and *Rambour d'Ivry* being the best.

Messrs. J. Cheal & Son, Crawley, Sussex, also had a few fruits, *Curtail*, *Norfolk Beaudin* and *Betty Gosson* being the best.

There were a few good examples of *Grapes*. J. F. Campbell, Esq., Woodseat, Uttoxeter (gr.), Mr. J. Hollingworth, showing remarkably finely finished bunches of *Black Hamburgh*. Some bunches of *Foster's Seedling* from the same source were also very fine, but in both instances the bunches themselves were only of medium size.

Muscats came from Mr. M. E. Peters, gr. to J. L. Mansell, Esq., Somerset Terrace, Guernsey, and were large in berry and well finished. Mr. G. Wythes, Syon Gardens, Brentford, showed fruits

of *Auguste Nicaise Strawberry* and a seedling *Melon*.

Mr. J. Maher, Stoke Court Gardens, Slough, had a dish of *Nectarine Violette* *Hi-tive*, and one of *Peach Stirling Castle*, both of good quality; but the fruits of the same variety of *Peach* from Mr. J. W. Reed, gr. to E. Pettit, Esq., Broadlands, Outland's Park, Weybridge, were excellent; a dish of *Tomato Perfection* and bunches of *Black Hamburgh* and *Buckland's Sweetwater Grapes* were also evidences of good cultivation. *Black Hamburgh Grapes* and a dish of fine *Tomatoes* were also sent by Mr. J. R. Featherby, The Vineries, Gillingham, Kent. Mr. Milner, gr. to Lord Fowley, Ruxley Lodge, Escher, had a dish of *Peaches* and a basket of *Mushrooms*. From the Royal Horticultural Society's Gardens at Chiswick came a large collection of *Radishes*, which had been grown for trial, and the following short varieties were selected:—*White Turnip*, *Early Scarlet Forcing*, *Scarlet White-top*, *Scarlet Olive-shaped*, *Improved French Breakfast*; of long varieties, *Wood's Long Frame* and *Long White*. A dozen varieties of *Kihubar* were also sent.

HORTICULTURAL NOVELTIES, &c.

These, in the form of manures, insecticides, all sorts of utilitarian objects, &c., were largely shown by Messrs. Wood & Sons, Wood Green, who also had capital samples of peat and other soils.

Messrs. C. Toope & Co., Stepney, showed samples of boilers in small form, and various methods of heating, &c. The common forms of horticultural sundries were markedly absent at this stand. They also showed an ingenious method of ventilating a glass-house by passing the air entering by ventilators near the ground-level through chests filled with sticks of charcoal in tiers, and thence onwards to the heating apparatus. The roof is furnished with a longitudinal outlet pipe running along at the apex, that is fitted with capped openings, which show on the outside of the roof. The air is thereby rendered sweet, and is freed from all noxious fumes, the constituents of town fog, and other impurities, and the ventilation of the house is perfect, and it is, moreover, always in working order, and admits of regulation to suit various kinds of plants. *Vines*, &c.

Mr. G. Phippen, Reading, had a large lot of elegant floral decorations carried out in a rather novel style, and Mr. Perkins, Coventry, showed bouquets of choice flowers arranged with much taste. Decorations made of the red *Seagwells* were shown by Mr. Smout, Hastings. Messrs. Walters & Co., Leytonstone, had *Orchid* baskets, and Messrs. E. P. Dixon & Sons, Hull, showed their patent flower tubes and label holders; from Mrs. Hodgkins, Withington, came elegant screens, &c., of skeleton leaves and seed-vessels.

The following are the awards:—

Silver Gift Flora Medals.

- To Messrs. Peed & Sons, for *Anthurium*.
- To Messrs. James & Son, for *Calceolarias*.
- To Mr. C. Turner, for *Pelargoniums*.
- To Messrs. J. Veitch & Sons, for *Gloxinias*.
- To Messrs. Sutton & Sons, for *Gloxinias*.
- To Mr. Jeeton, for *Palms*.
- To Mr. Wiltshire, for *Caladiums*.
- To Messrs. Cutbush & Sons, for foliage and flowering plants.
- To Messrs. Cannell & Sons, for *Begonias*.
- To Mr. Ware, for herbaceous plants.
- To Mr. Munro, for fruit and vegetable.
- To Mr. T. B. Haywood, for *Orchids*.
- To Messrs. R. Smith & Co., for *Clematis*.
- To Messrs. H. Low & Co., for *Orchids*.
- To Messrs. Kelway & Son, for herbaceous plants.
- To Messrs. Barr & Son, for herbaceous plants.
- To Messrs. Paul & Son, for herbaceous plants.

Silver Flora Medals.

- To Messrs. J. Laing & Son, for *Rhododendrons*.
- To Messrs. Cannell & Sons, for *Calceolarias*.
- To Messrs. J. Veitch & Sons, for *Apples*.
- To Mr. Wythes, for *Orchids*.

Silver Bankian Medals.

- To Mr. W. Rumsey, for *Roses*.
- To Messrs. Paul & Son, for *Alpines* and *Herbaceous plants*.
- To Messrs. Balchin & Sons, for *Leschenaultias*.
- To Messrs. J. Veitch & Sons, for *Herbaceous plants*.
- To Messrs. Dobbie & Co., for *Pansies*.
- To J. E. Campbell, Esq., for *Grapes*.
- To Mr. J. R. Featherby, for *Grapes* and *Tomatoes*.
- To E. Pettit, Esq., for *Grapes*, *Peaches*, and *Tomatoes*.

To J. L. Mansell, Esq., for Grapes.
To Messrs. Bunyard & Co., for Apples.
To F. Wigan, Esq., for Orchids.
To Mr. G. Hippen, for Bonquets, &c.

Cities

To Baron Schroder, for Orchids.
To Sir Trevor Lawrence, for Orchids.
To Messrs. F. Sander & Co., for Orchids.
To H. M. Pollett, Esq., for Orchids.
To Mr. J. Cypher, for Orchids.
To Messrs. Paul & Son, for Roses.
To Messrs. Backhouse & Son, for Ferns.
To Mr. H. B. May, for foliage plants.
To Messrs. W. & J. Birkenhead, for Ferns.
To Messrs. J. Laing & Sons, for foliage and flowering plants.
To Messrs. Wm. Paul & Son, for Roses.
To Messrs. Perkins & Sons, for bonquets.
To Messrs. J. Laing & Sons, for Begonias.
To Messrs. R. S. Williams & Sons, Orchids.

First-class Certificates.

To Saxifraga MacNabiana, from Messrs. J. Laing & Sons.
To Paeonia conchiflora, from Messrs. Paul & Son.
To *Lactrea f.-m. cristata*, from Messrs. W. & J. Birkenhead.
To *Aster alpinus* var. *speciosa*, from Messrs. Barr & Son.
To *Aster alpinus* var. *speciosa*, from Mr. T. S. Ware.
To Dendrobium MacCartheri, Mr. G. Cypher.
To *Miltonia Bleui splendens*, from Messrs. F. Sander & Co.
To *Cattleya Mendelii* Prince of Wales, from Messrs. F. Sander & Co.
To *Miltonia vexillaria* Fairy Queen, from Messrs. F. Sander & Co.

Acorns of Merit.

To Begonia Enchantress, from Messrs. J. Laing & Sons.
To Begonia Henshaw Russell, from Messrs. J. Laing & Sons.
To Begonia Negro Boy, from Messrs. J. Laing & Sons.
To Gloxinia Mrs. J. Donaldson from Messrs. J. Veitch & Sons.
To Pyrethrum Clemence, from Messrs. Kelway & Son.
To Pyrethrum Carl Vogel, from Messrs. Kelway & Son.
To Lupinus Foxi, from Messrs. Kelway & Son.
To Delphinium Autolyous, from Messrs. Kelway & Son.
To Pelargonium Prince Henry, from Mr. F. Perkins.
To Gloxinia Her Majesty, from Messrs. Sutton & Sons.
To Gloxinia Prince of Wales, from Messrs. Sutton & Sons.
To Gloxinia Princess of Wales, from Messrs. Sutton & Sons.
To Gloxinia (strain) netted, from Messrs. Sutton & Sons.
To Begonia Rev. W. Wilks, from Messrs. H. Cannell & Sons.
To Anthurium album maximum, from Messrs. F. Sander & Co.
To *Laelia purpurata* Empress, from Mr. J. Cypher.
To Dendrobium Bensoniae alba, from Mr. J. Cypher.
To Dendrobium Falconeri delicata, from Mr. J. Cypher.
To Sarcopodium Daurii, from Baron Schroder.
To *Cattleya Lawrenceana* delicata, from Baron Schroder.
To *Cypripedium Volonteanum*, from Messrs. F. Sander & Co.
To *Oncidium noraimense*, from Messrs. F. Sander & Co.

ROYAL BOTANICAL AND HORTICULTURAL OF MANCHESTER.

WINNERS EXHIBITIONS.—Manchester has once more been well to the fore, and the twenty-fourth exhibition, which opened on the 23rd inst., was in every way worthy of the occasion. It is true that the large specimen plants of Mr. Schloss, Mr. H. L. Nicholls, and others, are no longer to be found there; but their place is occupied by other features, and especially by illustrations of superb groupings, which, seeing how much they are appreciated, and the ad-

mirable teaching they supply, appears to be a change for the best. Lord Zetland, Mr. James Cypher, and others still supply fine examples of stove and greenhouse plants; noble Palms and Ferns come from several quarters, and the large specimens Mr. Bruce Findlay has in the gardens come in very useful indeed in working out bold and striking features in the annex. The weather, on the two first days especially, was gloriously fine, and a good attendance rewarded the efforts of the promoters.

Groups Arranged in Order.—The leading class was for a group of any extent, Orchids to be a leading feature. These were arranged on the east side of the exhibition house, and the five that competed occupied a large space. Two were at once singled out as showing great excellence in the arrangement: one was from Mr. Blair, gr. to the Duke of Sutherland at Trentham; the other was from Mr. Cragg, gr. to A. Heine, Esq., Fallowfield, Manchester; Mr. Blair's arrangement secured the 1st prize. There was a background of elegant Palms, and next them flowering Orchids and other plants; in the centre came mounds of Fern, from which issued lovely Orchids, each surmounted by an elegant Palm. The foreground was formed of dot-plants, rising out of a bed of moss; five pieces of *Masdevallia rosea* and *Cypripedium bellatulum* being especially noticeable; but no description does justice to this remarkable piece of the decorator's art. Mr. Cragg had a superb group also, most elegant and rich in Orchids, intermingled with Palms and other plants. Mr. J. McIntyre, gr. to Mr. J. Gurney Pease, Woodside, Darlington, was 3rd; and extra prizes were awarded to Mr. R. Elphinstone, gr. to C. M. Royle, Esq., Rochdale; and Mr. J. Currey, gr. to Colonel Pepper, Surrey.

The groups, occupying a space not exceeding 200 square feet, were in the annex, and here Mr. S. Baerlin, Oak Demo, Huddersy, was 1st, with a very fine group indeed, arranged on somewhat similar lines to the preceding one; Mr. Etkin, gr. to Mr. Thomas Agnew, Eccles, being 2nd.

In the nurserymen's class for a group consisting of Orchids and other plants, Mr. J. Cypher was 1st, with a very fine arrangement, the Orchids being singularly fine and effective. Mr. J. Robson, nurseryman, Altrincham, was 2nd.

Orchids. If these were not so numerously shown as in past years, they were very fine and effective. The best ten came from the fine collection at Blenheim, Mr. Whillans, the Duke of Marlborough's Orchid grower, bringing down some superb plants, which gained the 1st prize. They were, *Laelia purpurata*, with eight-on flower-stems; *Cattleya Skinneri*, C. Mossie, a very fine C. Mendelii, *Dendrobium thysiflorum*, D. Falconeri, and D. Dearii; *Cypripedium caudatum*, a fine piece with something like fifty flowers; C. barbatum, C. selligerum majus, very fine, and C. levigatum, and the bright-coloured *Epidendrum vitellinum*. Mr. Blair, Trentham Gardens, was a good 2nd, having fine pieces of *Cologeton cristata*, *Odontoglossum Alexandrae*, O. Pescatorei, *Cattleya Mendelii*, C. Mossie, *Miltonia vexillaria*, three fine varieties of *Laelia purpurea*, &c. Mr. Hodgkinson, High Lawn, Bowdon, was 3rd.

With six Orchids, Mr. Blair was a good 1st, with admirable specimens of *Oncidium ampliatum majus*, *Cattleya intermedia*, C. Mossie, *Laelia purpurata*, *Cypripedium caudatum*, and *Dendrobium Dearii*; Mr. A. Johnson, gr. to Thomas Slater Esq., Whitefields, Manchester, was 2nd, with *Odontoglossum crispum*, O. Bossi majus, O. Pescatorei, *Laelia grandis*, L. purpurata, and *Dendrobium thysiflorum*; Mr. Hodgkinson was again 3rd.

With ten Orchids, *bona fide* specimens, Mr. A. Heine was 1st, with excellent examples of *Dendrobium Dalhousianum*, D. nobile, D. thysiflorum, *Yanda teres*, *Cattleya Skinneri*, C. S. alba, *Phalenopsis amabilis*, *Laelia purpurata* and its white variety, and *Calanthe veratifolia*; 2nd, Mr. Blair, his leading plants being *Cattleya Skinneri*, C. Mossie, *Laelia purpurata*, *Coleogyne cristata* Trentham variety, &c. In the nurserymen's class for 10 Orchids, Mr. James Cypher was 1st with some very fine specimens, consisting of *Dendrobium Jamesianum*, very fine; D. thysiflorum, *Laelia purpurata splendens*, *Cymbidium Lowianum*, *Cattleya Skinneri*, C. Mendelii, *Cypripedium caudatum*, C. levigatum, C. barbatum, and *Masdevallia Lindenii*. Mr. Cypher was the only competitor.

Stove and Greenhouse plants.—Perhaps the specimen-stands on this occasion were not quite equal to those seen in past years, but they were very fresh, well-grown, and finely-flowered. The best eight came from Mr. Nicholls, gr. to the Earl of Zetland,

who had *Bronia elatior*, *Franciscea calycina* major, *Anthurium Scherzerianum*, A. Andreanum, with some very fine spathes; *Draconophyllum gracile*, *Erica depressa multiflora*, *Aphelexis macrantha purpurea*, and *Clerodendron Balfourianum*; 2nd, Mr. S. Baerlin, with some good plants, generally similar to the foregoing. Mr. James Cypher had the best 10 plants, including three fine specimen *Azaleas*, *Stephanotis floribunda*, *Darwinia tulipifera*, D. fuchsoides, *Pimelea Hendersoni*, *Aphelexis macrantha purpurea*, and *Anthurium Scherzerianum*; 2nd, Mr. J. F. Mould, nurseryman, Pewsey, Wilts. The best specimen stove plant was *Anthurium Scherzerianum*, from Lord Zetland; Mr. Blair coming 2nd with the same. Mr. Currey, gr. to Colonel Pepper, Salisbury, had the best specimen greenhouse plant in *Darwinia fuchsoides*: Lord Zetland coming 2nd with *Aphelexis rosea*.

Geraniums.—*Ericas*, were represented by small but nicely flowered plants, though in the amateurs' class the 1st prize was withheld.

In that for nurserymen with six plants, Mr. J. Cypher was 1st, and Mr. J. F. Mould 2nd, the varieties being those ordinarily exhibited.

Tuberous Begonias.—The early date of the show operated to seriously circumscribe the competition with these. Messrs. Lord, Ashton-on-Mersey, was 1st with six single varieties; the doubles were very small and poor.

In the nurserymen's classes for twelve of each, Messrs. Ryder & Son, nurseryman, Sale, were placed 1st with small but admirably grown and flowered plants of seedling varieties of high quality.

Pelargoniums.—Mr. Charles Rylance, nurseryman, Otmskirk, was 1st with eight very fine specimens of show varieties, some of the best ever seen at Manchester, consisting of *Beauty*, *Prince Leopold*, *Venus*, *Duchess of Edinburgh*, *Harlequin*, *Pygmalion*, *Lady Isabel*, *Edward Perkins*, and *Gaiety*.

The fancy varieties were small and poor, and the zonals not up to the usual mark. Some nicely grown and bloomed Ivy-leaved varieties were shown by Messrs. N. A. Earle and C. M. Royle.

Roses.—Plants in pots were numerous, and furnished charming masses of colour. The best ten plants came from Mr. J. G. Wood, gr. to James Brown, Esq., Heaton Morsey, well-grown and flowered, the leading varieties, *Madame G. Lutzet*, *Juno*, *Francois Levet*, W. A. Richardson, *Madame H. Jamain*, and *Marie van Houtte*. Mr. N. A. Earle was a good 2nd.

With twenty Roses, including standards, Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st, with excellent plants of *Celine Forestier*, *Madame Charta*, *Paul Jamain*, *Centifolia rosea*, *Magda Lacharme*, *The Bride*, *Merveille de Lyon*, *Francois Levet*, *Madame Margottin*, *Innocente Pirola*, and *Violette Bouyer*. Mr. W. S. Williams, nurseryman, Stockport, was 2nd.

With thirty plants Messrs. Paul & Son were again 1st, with *Souvenir d'un Ami*, *Niphetos*, *Jean Ducher*, *Etienne Levet*, *Alba rosea*, *Caroline Kuster*, *La France*, *Merveille de Lyon*, *Comtesse de Serenye*, *Cheshunt Hybrid*, W. A. Richardson, *Francois Levet*, and *Antoine Montyon*; 2nd, Mr. J. F. Mould.

Herbaceous and Bulbous Plants.—In the amateur class for thirty, Mr. S. Vickers, gr. to J. Lamb, Esq., Bowdon, was 1st, having good specimens of *Lilies*, *Phloxes*, *Lupinus*, *Glabellus*, *Trollius*, *Campanula*, *Spiraea*, &c. Mr. R. P. Gill (Mr. W. Plant, gr.), was 2nd, also with a very good collection.

In the nurserymen's class the best collection—a very large and imposing one—came from Messrs. Dickson's (Limited), Chester, and included *Lilium Harrisii*, arantum, and others; *Ipomoea*, *Lychnis*, *Iris*, *Tulips*, *Scillas*, *Funkias*, *Cypripedium spectabile*, *Hemerocallis Kwanoo*, and its variegated form; *Anthericum liliastrum*, &c.; 2nd, Messrs. W. H. Stansfield & Co., nurserymen, Southport, with good examples of similar subjects.

Alpine Plants.—These, as is usual at Manchester, made a very interesting exhibit. The best thirty came from Mr. R. P. Gill, who had *Primula Sieboldi* in variety; P. obconica, *Ajuga genevensis*, *Silene pendula compacta*, *Campanula Portenschlagiana*, *Saxifraga pyramidalis*, *Rodigieria podophylla*, the *Edelweiss*, &c.; 2nd, Mr. J. Lamb, who had *Alyssum saxatile compactum*, *Saxifraga pyramidalis*, S. Wallacii, S. alpinis, *Iberis corifolia*, *Phlox setacea*, &c. In the nurserymen's class for forty Alpines, Messrs. Paul & Sons were 1st with a remarkably good collection, including *Cypripedium pavillorum*, *Globularia trichosantha*, *Ranomdia pyrenaica*, and its white variety; *Dianthus alpinus*, the *Edelweiss*, *Lithospermum prostratum*, *Myosotis rupicola*, *Omphalodes luteiflora*, &c.; 2nd, Messrs.

Dicksons, who had capital examples of *Cypripedium acaulis*, *C. spectabile*, *C. calceolus*, *Onosma taurica*, *Saxifraga McNabiana*, *S. pyramidalis*, *Dodecatheon integrifolium*, *Hebecha sarguina*, &c.

Pansies and Violas.—The large pots of these staged at Manchester had a very pretty effect. The best twelve pots of show Pansies came from Mr. F. Blower, the Children's Hospital, Pendlebury;—George Kidd, yellow self; Mrs. Laing, white self; Dr. Hardy, dark self, being very good; Mr. R. P. Gill was 2nd.

In the nurserymen's class for twenty pots, Mr. S. Robinson, Florist, Sale, staged a very good lot indeed, having Dr. Hardy and W. E. Gladstone, dark self; George Rudd and Cloth of Gold, yellow self; Mrs. Laing, white self; Bluestone, blue self; Lizzie Bullock, Meteor, and Lady Derby, yellow grounds; Mrs. Buckland and Mr. Eades, white grounds. Mr. Robinson was the only exhibitor in this, and also in the class for twenty pots of fancy Pansies, staging a remarkably fine lot, the most striking being Joseph Fleming, Robert Scott, W. A. Dixon, David Baird, Neil McKay, Agnes Mitchell, and Mrs. Nelson. Mr. Robinson also had the best twenty pots of Violas, having of blues, King of the Blues, Queen of the Blues, and Blue King; of yellows, Sovereign, Queen of Yellows, and Ardwell Gem; white, Countess of Hopeton and Pirig Park; Skylark, white, edged with blue; and Countess of Kintore, purple, blotched with white. Mrs. Mellor, Chorlton-cum-Hardy, was 2nd. There was a class for six pots, but they were poorly shown.

Foliaged Plants.—Some fine examples of these were staged; Lord Zetland's was the best ten. There were staged *Cycas circinalis*, *Chamarops Fortunei*, *Kentia Belmoreana*, *C. Forsteriana*, *Dicksonia antarctica*, *Crotone Thomsoni* and *Queen Victoria*, *Gleichenia rupestris*, *Neottopteris australasica*, and *Dasylirotium acrotichum*; 2nd, Mr. J. S. Baerlin, having some fine specimens also, particularly *Cordyline indivisa*, *Euphorbia Lehmanni*, *Cycas circinalis*, some fine *Crotone*, &c.

Mr. Cypher had the best eight specimens, consisting of *Lantana borbonica*, *Cycas circinalis*, *Kentia australis*, *C. Forsteriana*, *Phorisma tenax variegata*, *Cordyline indivisa*, and two fine *Crotone*s; 2nd, Mr. J. F. Mould.

Ferns were a bold feature. The best eight stove and greenhouse types came from Mr. F. Millward, gr. to R. Goolair, Esq., Lawnton, Didsbury, who had *Davallia Mooreana*, *psixidata*, and *polyantha*, *Alsophila excelsa*, *Cibotium Schiedeii*, *Adiantum pentaphyllum*, &c.; 2nd, Mrs. Gurney Peate, who had three good pieces, *Gleichenias*, *Davallia fijiensis*, *Adiantum*, &c.

Hardy Ferns were surprisingly fine, more than rivaling the tender varieties for beauty of development. Mr. R. Tydesley, Worsley, staged a splendid lot of twelve, generally finely crested forms of *Lastrea*, *Athyrium*, *Osmunda*, *Polystichum*, &c.; Mr. N. A. Earle was 2nd, with a fine lot also. The best twelve in the nurserymen's class came from Messrs. H. Stansfield & Co.

Palms were very fine. Mr. S. Baerlin had the best four, consisting of *Phoenix rupicola*, *Kentia australis*, *C. Belmoreana*, and *Thrinax elegans*; Mr. Thomas Agnew was 2nd, with *Cocos Weddelliana*, *Geonoma gracilis*, *Lantana borbonica*, and *Kentia Canterburyana*.

Crotone were small, but in good character. Miss Lord was placed 1st, with some unnamed plants; Mrs. Gurney Peate being 2nd.

Messrs. A. P. Ker & Co. were the only exhibitors of ten in the nurserymen's class, having finely finished examples of *Disraeli*, *Aigburthensis*, *gracilis*, *Neumannii*, *Montefortainensis*, *Queen Victoria*, *Williamsii*, *ruberimum*, *Baroness Rothschildii*, and *Hookeri*.

Dracaenas were represented by well-grown and coloured specimens. Colonel Wingfield, Shrewsbury, had the best six in the open class, consisting of *Thomsoni*, *Baptistii*, *Norwoodensis*, *anabilis*, *Anerleyensis*, and *Gladstonei*; Mr. J. Lamb was 2nd.

Messrs. Ker & Sons had the best twelve—excellent plants of *Salmonia*, *Berkeleyi*, *Madame Lecocq*, *Dumeseul*, *Norwoodensis*, *Dr. Hepland*, *Gladstonei*, *terminalis alba*, *Halseyi*, *Versaillesensis*, *Barroni*, and *Lindeni*; Mr. J. F. Mould was 2nd.

Pitcher Plants.—The only collection of these in the amateurs' division came from Mr. Blair, who staged a number of unnamed specimens.

The best collection of ten, from Mr. J. A. Braze, were all *Sarracenias*, such as *Courtier*, *Hybrida purpurea*, *Flambean*, and *Tolleiana*.

A very large collection of Japanese and other evergreen shrubs was staged by Messrs. J. Waterer &

Sons, of Bagshot Nurseries, the Japanese Maples being largely represented.

Cut Flowers were in the form of Roses. A very fine stand of twelve Tea-scented varieties came from M. Bailey, Esq., Liverpool; Mr. Thomas Gee, Alerton, being 2nd.

The only exhibitor of eighteen Tea-scented and Noisette Roses was Messrs. Harkness & Sons, nurserymen, Bdale, who had a very fine lot of *Marchal Niel*.

Mr. James Burn, Longford Heaton, Mersey, had the best twelve varieties; Miss Lord being 2nd.

Fruit.—A remarkably good display of fruit was witnessed. The best eight dishes came from Mr. J. McIndoe, gr. to Sir J. W. Pease, Bart., Luton Hall, Guisborough, who had very fine Black Hamburg and Foster's Seedling Grapes, Queen Pine, Grosse Mignonne Peaches, and Lord Napier Nectarine. Sir Harry Strawberry, Exquisite Oranges and Melon. Mr. Blair was 2nd, with the same varieties of Grapes, Hale's Early Peaches, Strawberries, &c.; Mr. J. G. Morris a very good 3rd. Mr. Lowden, the Quinta Gardens, Chirk, was 1st, with two very finely finished bunches of Black Hamburg Grapes; Mr. W. Speed, gr. to Lord Penrhyn, Bangor, was 2nd, with excellent bunches also. Mr. Lowden had the best two bunches of white, staging admirable Muscat of Alexandria; Mr. J. G. Morris 2nd, with Foster's Seedling. Mr. McIndoe was the only exhibitor of two Pine-apples, having Queen and a seedling; and of one, having a good Charlotte Rothschild. Some very fine pots of Strawberries were shown by Mr. Blair, Mr. Upjohn, Worsley Hall Gardens, and Mr. Samuel Barlow—the sorts Sir Harry and Noble. Mr. Upjohn had the best dish of Peaches, in Hale's Early, very good indeed; Mr. McIndoe being 2nd, with Grosse Aignonne. Mr. R. Davies, gr. to Mr. Meynell-Ingram, Temple Newsum, was 1st; and Mr. McIndoe, 2nd, with Nectarines. Lord Napier being shown by both. A number of Melons were staged, Mr. J. G. Morris had the best scarlet in Masterpiece, and Mr. Blair the best green in High Cross Hybrid. The best Cherries were Black Circassian, fine, Mr. Davies. The best Strawberries were La Grosse Sucree, from Mr. Upjohn; Sir Harry and Noble were also very fine. Tomatoes were represented by a good lot of Perfection; and of fifteen brace of Cucumbers Lockie's Perfection carried off the prizes.

Miscellaneous Exhibits were very numerous, and of great value in making up the show. Mr. E. S. Williams, Victoria Nurseries, Holloway, had a large collection of choice plants, including some very fine *Amaryllis*, and good collections also came from Messrs. Dicksons, Chester, and the Liverpool Horticultural Company. Mr. F. Sander, St. Albans, had a number of new and valuable Orchids; and so had Messrs. Charlesworth, Shuttleworth & Co., of Bradford. Mr. W. Owen, nurseryman, Northwich, had a collection of choice Cattleyas. Messrs. Ryder & Son, nurserymen, Sale, had a very extensive collection of double and single *Begonias* of high quality, representing their strain. Messrs. W. Clibran & Son, Oldfield Nurseries, Altrincham, plants of various kinds, and collections of cut *Pelargoniums* of various types, shown in very fine bunches. Mr. H. Stevenson had some excellent shrubby *Calceolarias*; and Messrs. Isaac Davies & Son, Ormskirk, plants and cut examples of their new hardy *Rhododendrons*.

BATH.

MAY 21.—A glorious day rendered the fine display at the Sydney Gardens enjoyable to the many visitors who attended. Around the Orchid exhibits, the interest, as in former years, centred, and also in that class, which now seems to make the chief feature in most flower shows—the groups arranged for effect. In this class, as in all the leading classes for Orchids, the Rev. E. Handley, of Bath, has not been deposed from the leading place, although R. B. Cater, Esq., another clever cultivator, also of Bath, gradually shortens the distance in a very ominous manner. In the first prize group, the Rev. E. Handley had an unique plant in *Laelia purpurata Handleyana*, which is a long way in advance of any of its section, viz., the *L. Russelliana* and *L. Schroederiana* group. The open forms of *Laelia purpurata* were also exceptionally good and the *Odontoglossum* *Cattleya Lawrenceana*, *C. Mendelii*, *Cypripedium caudatum*, and other species good and well displayed, the centre being especially attractive with its backing of *Areca lutescens*, under which was a noble form of *Vanda* teres, then some fine sprays of *Odontoglossum* and the elegant *Oncidium phymatocidium*, with *Dendrobium Bensonae* on either side, and the drooping

flowers of *Cattleya citrina* hanging over, with the *Panicum* and *Isolepis* which faced the arrangement. Mr. Cater's 2nd prize group had some fine specimens—too large indeed for the purpose of effective arrangement—the centre *Dendrobium thyrsiflorum* had about a dozen spikes; the pretty *Burlingtonia fragrans* ten spikes; and many of the *Cattleyas* and *Laelias* were good enough to enter in the classes for specimen plants. Messrs. Heath & Son, of Cheltenham, secured the 3rd prize with a pretty group, in which the brightly-coloured *Masdevallias* were conspicuous.

For six Orchids the Rev. E. Handley (gr. Mr. Kerlake) was first with admirable specimens of *Cattleya Skinneri*, *Cypripedium caudatum*, with ten flowers; *Cymbidium Lowianum giganteum*, *Laelia purpurata* and *Dendrobium enavissimum*. Messrs. Heath & Son were second with some very large made-up plants. For four Orchids the Rev. E. Handley was again first with a *Cattleya Mendelii* with sixteen flowers, and other specimens to match. In the class for a single specimen, the Rev. E. Handley and Mr. R. B. Cater were respectively 1st and 2nd, the former having a *Laelia purpurata* with twenty-six flowers, and the latter a smaller plant of the same species. C. W. MacKillop, Esq., of Royal Crescent, Bath, a very successful exhibitor in other classes of specimen plants, was also a prizetaker.

A class which attracted much attention was that for a group of plants, in or out of bloom, arranged for effect in a space not less than 150 square feet, and these were arranged in a tent by themselves. Colonel Pepper, of Salisbury, easily carrying off 1st. For a smaller group, Alderman Jerome Murch was 1st. For new or rare plants, Mrs. Gouldsmith was 1st, with a curiously mottled-lipped *Cattleya Mossiae*. In the classes for large specimen stove, greenhouse, and ornamental plants and Ferns, Mr. J. Cypher, of Cheltenham, came out in his usual manner with perfect and fresh specimens. In these classes, C. W. MacKillop, Esq. (gr. Mr. A. Taylor), secured some of the most important 1st places with grand exhibits, Major W. L. Clarke, Colonel Landon, Colonel Peover, the Right Hon. Lord Justice Lopes, Mr. W. C. Drummond, of Weston Nurseries, and Mr. J. F. Mould, also exhibiting well and successfully.

In Roses, which were of great merit, the Rev. E. Handley seemed as invincible as in the Orchid classes; Mr. S. P. Rudd being 2nd to his 1st in both classes.

Cut flowers, fruits, and vegetables were, as usual, well exhibited, and one of the most interesting features in the show was that made up of the miscellaneous collections staged by nurserymen not for competition, that arranged by Messrs. R. Veitch & Co., of Exeter, being the most extensive, and comprising an interesting collection of hardy foliage and flowering plants, rare herbaceous perennials, fine *Anthuriums* and *Orchids*, *Maples*, *Rhododendrons*, varieties of *Cytisus*, and, among other new plants, their *Asparagus secundus deflexus*, a lovely plant.

Mr. A. Walters, West Kensington Nurseries, Bath, also had a very interesting collection, in the centre of which was a large specimen of *Dendrobium chrysoxanthum*; and among the spring flowers, an elegant collection of well-grown Ferns, some of them rare species, such as *Polypodium refractum*, *Lomaria discolor*, *bipinnatifida*, &c.

Messrs. George Cooling & Son, of Bath, had a very fresh-looking display of Tea Roses, a collection of *Auribrias*, *Orchids*, *Heaths*, *Petunias*, *Pansies*, and other florists' flowers of high merit.

SOUTHAMPTON ROYAL HORTICULTURAL.

MAY 25.—A small but interesting exhibition was held in the Royal Southampton Society's grounds at Westwood Park on Whit Monday, and was the first held at this season of the year by the Society.

The main part of the exhibition tent was filled with non-competitive exhibits. Chief amongst them being a fine bank of *Rhododendrons* in pots from the Red Lodge Nurseries, Southampton, which Mr. Rogers kindly lent for the occasion, which, being profusely flowered, and arranged in combination with *Conifers* in pots, made a pretty effect. Occupying one end of the same tent was a group of miscellaneous plants from Mr. E. Wills, gr. to Mrs. Pearce Basset, Southampton, also making a good display. Mr. T. Hall, gr. to the President of the Society, S. Montagu, Esq., South Stechan House, Southampton, sent a number of well-grown *Gloxinias*,

consisting chiefly of flowers with rich colours, and being set up with Caladium argyrites and Adiantum cucumatum, a pretty combination was effected.

Mr. B. Ladhams, florist, Shirley, had a capital list of market Pelargonium in pots, interspersed with Petunias and Pansies; the same exhibitor staged a splendid collection of cut blooms of herbaceous perennials that were much admired.

For miscellaneous plants arranged for effect in groups in area not greater than 80 square feet, Mr. E. Can, gr. to W. A. Gillet, Esq., Fair Oak Lodge, Bishopstoke, was the most successful competitor.

The group contained some well-bloomed Orchids, and was tastefully arranged with Ferns and other suitable plants. Mr. G. Busby, gr. to F. Willan, Esq., Thornhill Park, Bitterne, was a good second.

Mr. E. Can showed some nicely grown Orchids, of which Lælia purpurata, Cattleya Mossiae, Odontoglossum citrosum, and Oncidium spheclatum, with spikes 4 feet long, were the most noteworthy.

THE WEATHER.

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degree—i.e. "Day-degrees" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

Table with columns: DISTRICTS, TEMPERATURE, RAINFALL, BRIGHT SUN., ACCUMULATED, and various weather metrics for different districts.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

THE PAST WEEK.

The following summary record of the weather for the week ending May 21, is furnished from the Meteorological Office:—

"The weather during this period has been fine and bright generally over all the more eastern and south-eastern parts of the kingdom. In the western districts it was unsettled and rainy during the earlier days, but subsequently became very fine and summer-like there also. Thunder and lightning were experienced at many stations during the early part of the time, and again over our south-western districts at its close."

"The temperature has been above the mean in all districts, the excess having ranged from 1° in the 'Channel Islands,' 2° in Ireland, S., and 3° over the greater part of England to 5° in England, N.W., and to 5° or 6° over Scotland. The highest of the maxima, which were recorded on the 24th, ranged from 73° in Scotland, E., to 78° in many parts of England and in Ireland, N., and to 80° in England, S.' The lowest of the minima, which were registered on rather irregular dates, varied from 37° in the north and east of Scotland to 45° in

'England, N.E.' and 'England, N.W.,' and to 45° in the 'Channel Islands.'

"The rainfall has exceeded the mean in Ireland and the 'Channel Islands,' and just equalled it in 'England, S.W.' and the 'Midland Counties,' but in all other districts it has been less than the normal amount."

"Bright sunshine shows a general increase in duration, the percentage of the possible amount having ranged from 35 to 39 in Scotland, from 47 to 49 in Ireland, and from 42 to 66 over England."

MARKETS.

COVENT GARDEN, May 29.

The first of this week has been most disastrous to all kinds of best fruit, there having been literally no inquiry for anything, owing to the recess. The market has also been glutted with small Peaches, very few samples coming good. Best Strawberries have only been cleared under the value of seconds, the fine weather of last week having sent on large quantities at an unfortunate time, but they will most probably recover themselves at the beginning of the week. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table listing prices for Apples, Grapes, Lemons, and Melons.

VEGETABLES—AVERAGE RETAIL PRICES.

Table listing prices for Asparagus, Beans, Carrots, Cauliflowers, Celery, etc.

Portulaca, Jersey, 15s. to 18s.; Malta, kidneys, 10s. to 15s.; rounds, 10s. to 12s.; Canaries, 10s. to 14s.; Lisbon, 7s. 6d. to 8s. 6d.; Danish, 12s. to 15s. Markets dull. Old Potatoes quiet. J. B. Thomas.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants like Arabis Sieboldi, Arum Lilies, Azalea, etc.

* Including plants in variety in boxes, and also in pots.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table listing prices for Abutilons, Anemones, Bouvardias, Calla-thiopia, Carnations, etc.

ORCHID-BLOOM IN VARIETY.

LONDON: May 29.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write

that to-day's market, as might be expected, presented quite a holiday appearance, with almost a complete absence of business. Clover seeds are, of course, just now quite neglected; indeed, the sowing demand for things generally is just now at the lowest possible ebb. Mustard and Rapeseed keep firm. Choice Blue Peas have got into narrow compass. Hempseed continues scarce and dear. In Canary-seed the late advance is well sustained.

FRUIT AND VEGETABLES.

SPITALFIELDS: May 28.—Good supplies of all kinds of green vegetables, potatoes, &c. Scarce supply of fruit. Demand fairly active at prices as under:—Gooseberries, 6s. to 6s. 6d. per half-sieve; natural Rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; Asparagus, 1s. to 2s. per bundle of 100 heads; Cabbages, 1s. to 2s. 6d. per tally; Cauliflowers, 2s. 6d. to 6s. do.; Radishes, 2s. to 3s. do.; Seakale, 1s. to 1s. 6d. per punnet; Spinach, 4d. to 1s. per bushel; Greens, 1s. to 1s. 3d. per dozen bunches; Parsley, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. per dozen bundles; Horseradish, 1s. 1d. to 1s. 4d. per bundle; frame Cucumbers, 2s. to 2s. 6d. per dozen; natural ditto, 3d. to 1s. do.; spring Onions, 1s. to 1s. 6d. per dozen bunches; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets; Cos Lettuces, 6d. to 1s. per score; Cabbage do., 6d. to 9d. per dozen; Endive, 1s. to 1s. 6d. per dozen; Carrots, 16s. to 20s. per ton.

NOTICES TO CORRESPONDENTS.

Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

ABORTIVE FLOWERS OF ODONTOGLOSSUM, E.P. We have this season received similar specimens from other correspondents, and can only account for them by supposing the extra vigour of the plants, which has in each case been noted, to have turned towards the growth while yet the buds were forming, and diverting the flow of sap from the flowers, thus causing the abortion. These things are kept too constantly moist, and it will probably be found that a rather drier and more airy house, and less water at the roots from the time the spikes appear until the flowers expand, will do away with abortive and imperfect flowers.

BOOKS: F. H. B. Cross and Self-Fertilisation of Plants, Darwin, (John Murray, London). Domestic Floriculture, F. W. Burbidge, (W. Blackwood & Sons, London and Edinburgh).

COLEOPTERA: T. W. We do not find either fungus or insect, and attribute them to some check during growth, but how produced we do not know.

DENDROBIUM WARDIANUM: J. C. In your flower two stamens, which are generally abortive, have developed in the shape of supplementary lips.

HYBRID AND CROSS: C. S. F. Hybrids are intermediate forms, or males, produced between flowers of two different species. Crosses result from the fertilization between two plants of the same species.

NAMES OF PLANTS: T. R. The Backbean (Menyanthes trifoliata). The best time to move it would be after the flowering season is over.—W. P. L. 1, Prunus Padus; 2, Pyrus Aria; 3, Lycium barbarum; 4, Viburnum opulus.—J. S. Dendrobium Staphylea pinnata—Cymbria. Dendrobium aurantiacum—Vanda Wightii.—Stenand. Maxillaria tenuifolia.—T. H. W. Dendrobium cretaceum; D. albosanguinum.—C. A. M. C. Rhodotypos kerrioides.—P. M. L. 1, Abies pectinata; 2, Abies Nordmanniana; 3, Abies grandis; 4, Abies balsamea; 5, Picea Noronca; 6, Abies Lowiana, alias Parsonsi, alias lasiocarpa, alias concolor.—W. S. Dendrobium Dalhousianum.—L. L. 1, Symphytum caucasicum; 2, Euphorbia pilosa; 3, and again in fruit—we do not at present recognise it; 4, Genm rivale; 5, Armeria plantagina; 6, Saxifraga t-nella.—F. W. B. Veronica Lavandiana.—E. D. L. 5, Olearia Cunninghamii.

G. Paul. Primula farinosa, two varieties.—*T. E.* Lælia purpurata, a good but not extraordinary variety.—*L. C., Rigby.* 1, Oncidium maculatum; 2, Piptanthus nepalensis.—*W. H. S.* 1, Ribes aureum; 2, Ribes sp.—perhaps a common Currant; 3, Lælia purpurata, an ordinary form.—*F. O.* The Bird Cherry, Prunus Padus.—*A. T. Z.* Stanhopea bignina.—*W. H. S.* 1, Ribes aureum; 2, Ribes, sp., perhaps a common Currant; 3, Lælia purpurata, an ordinary form.

FEARNS: *A. G. H.* The tree is healthy, but there has been an excess of water at the roots at a particular period. Is the drainage quite what it should be?

RASPBERRY PLANTING: *J. C.* The canes should not have been planted later than the end of March, and probably all those which your employer ordered you to plant about a week ago will die, or make very weakly growth. Suckers may be detached carefully from stools, lifted with plenty of soil, planted on a north border, and watered heavily to settle the soil about them; and the end of April is quite late enough for that operation. The soil around them should be mulched with short manure and watering must be done in very dry weather. You need not lose the use of the ground for this summer and may crop it with the intended Cauliflowers, &c., not, of course, crowding the lines of Raspberries.

ROSES: *A.* As far as we can judge from the specimens sent, your Roses are very good and well worth cultivating.

TREE SEEDS: *R. H.* The fact that three weeks have elapsed since sowing the seed and no plants have appeared is no test of the goodness of the seed. Tree seeds often remain one and two years before germinating; and in the case of seeds with hard cases it is best to "stratify" them in the autumn—that is to let them lay between strata of earth or sand until March or April, and then sow them out of doors in properly prepared beds, or, in the case of small quantities, in boxes or pans. It is a good plan with Coniferous seeds to sow them in pots in October, and place the pans in a cold pit, protected against evaporation and the deprivations of mice by means of a close-fitting piece of tile or slate. Seeds so treated, usually (if the seed be new) come up well in the spring or late winter. The pots should be looked at once a month to see that they are not too dry, or mouldiness has spread over the surface. If mould has appeared, scrape off the crust carefully and replace it with sandy loam; but if sandy loam alone is employed to fill the pots mould will rarely give trouble. Seeds not often asked for are often sold when their germination is a matter of doubt. Conifer seeds should never be kept more than a few months before sowing them, as they soon spoil. Young seedlings of Cypresses from warmer climes than ours should be kept during the first five or six winters in pots in a cold frame; or if in beds a frame should be put over them, or even thin thatch would do.

VINERY, TOMATO-HOUSE, IRON ROOF, AND GLAZING WITHOUT PUTTY: *H. L. T.* Some systems are very good, there being no leaks, breakages from expansion, or paint necessary; but the iron (mild steel) should be galvanised. We cannot recommend dealers.

WATER LILY LEAVES: *J.* We cannot see that there is anything wrong. It looks like simple death and decay from natural causes.

WIREWORMS: *R. B. E.* See p. 682 of this issue, where you will find a remedy for the evil. When the crops are cleared off the land, dress it with gas-lime and soot, well incorporating these substances with the soil when digging it.

Testimonials.
"SIR, As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) WALTER SPILLER."

Major FOSTER has much pleasure in stating that the vinery and forcing houses which were erected by Mr. Helliwell in 1881, continue to give perfect satisfaction, both to himself and his gardeners.

Mr. E. GAY, Okeham, Yorkshire, January 23, 1890.
"SIR, Mr. Helliwell has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ribby Castle Garden, has been in every respect entirely satisfactory. The work has stood its course ever and for ever, and has not required a single touch of repair."

HELLIWELL, 9, Victoria Street, Westminster

SHANKS'S IMPROVED LAWN MOWER

The Demon
Insecticide and Cleanser
TRADE MARK

HIGHLY CONCENTRATED — MIXES INSTANTLY WITH WATER. For use in the Conservatory, Greenhouse, and Vinery; Flower and Kitchen Garden, the Hop-yard, and the Orchard.

Practically Tested by *Fraser's Gardeners*, acknowledged to be the most Perfect Insecticide yet Invented.

From Mr. R. TURLEY, Head Gardener to Sir Richard Webster, Q.C., M.P., Winterfold Gardens, Cranleigh, Surrey.—"Yours is the best Insecticide that has come under my notice; it not only destroys the 'pests,' but imparts a healthy look to the plants."

From Mr. F. A. H. The Gardens, Government House, R.M. College, Yorktown, Surrey.—"I am pleased to say I found your Insecticide all I could desire after a good trial; safe for the most tender foliaged plants. I can confidently recommend it to anyone."

From Mr. G. WILLIAMS, Nurseryman and Florist, Trumpington Road, Cambridge.—"We have given Demon Insecticide a fair trial, and believe it to be the best preparation for the destruction of insects, &c., infesting plant life. We shall continue to use it, and recommend it to our friends."

THE
"NEW EASY"
LAWN MOWER.

HAS AN OPEN STEEL ROLLER.

A man can work a 24-inch machine without assistance.

The Front Roller, with simple adjustment for regulating height of cut, enables the machine to cut close to the ground, and to do fine work, besides adapting it for verge cutting.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

JOURNEYMAN.—Age 22; good reference.—W. RICKERS, W. L. Bird, Florist, Davenporty.

JOURNEYMAN, in the Houses or Outdoor.—Age 22; good character.—H. EDWARDS, The Gardens, Worton Hall, Lissworth.

JOURNEYMAN, in the Houses, in a good Establishment.—Eight years' experience. Good references.—W. B. Aysford, Arundel, Sussex.

JOURNEYMAN, in the Houses.—Age 21; six years' experience Inside and Out. Three and a half years' good character from last place.—L. VINCENT, Felthorpe, near Norwich, Norfolk.

JOURNEYMAN, Inside, or In and Out.—Age 22; strong and active. Can be well recommended from last situation. TICOMAR, Mr. C. Varney, High Street, Wormley, Herts.

JOURNEYMAN, in the Houses. Age 19; four years' good character.—J. CLAYTON wishes to recommend a young man as above.—Geys House, Hollyport, Maidenhead, Berks.

IMPROVER, under Foreman, Inside.—Age 18, five years' experience Inside and Out. Bothy preferred.—W. CHAMMAN, Soale, near Farnham.

IMPROVER, in a Gentleman's Establishment, Indoors or Out. Age 17; strong and healthy. Excellent character.—A. B. Church Street, Loughton Bazaar.

TO NURSERYMEN.—Situation wanted for Two. Ages 23 and 21. Used to Plant and Fruit Growing. Good Grape-Thumers. Ten years in Nurseries.—G. HOLSON, 3, Wharf Road, Warrington, Herts.

TO NURSERYMEN.—Advertiser seeks situation in Nursery. Thoroughly well up in Plants, Fruit, and Flowers. Long experience. Good reference. W. H. 263, Shakespeare Road, Herne Hill.

TO NURSERYMEN.—A young Man wishes to go into a Nursery as a permanent hand. Twelve years' experience in Private Establishments. Excellent testimonials.—A. KAY, Oak Cottage, Darwen.

TO GARDENERS, &c.—Wanted, a place in Large Garden for a useful steady hand, anxious to improve. Excellent character, and usual premium paid.—RECTOR, Colton, near Engeley.

TO GARDENERS and OTHERS.—Wanted to place a respectable WALRUP (age 15), who will learn the Gardening.—Mrs. WALRUP, Britwell House, Watlington, Oxon.

To the Seed Trade.

TRAVELLER, or SHOPMAN.—Age 30; fifteen years' thorough practical experience in London Wholesale and Provincial Nurseries.—GARDENERS' Chronicle Office, 41, Wellington Street, Strand, W.C.

TO SEEDSMEN and NURSERYMEN.—An elderly person, who can Correspond and Invoice well, seeks employment in a Seed Warehouse or Nursery. Thoroughly practical, and would be willing to accept small remuneration.—F. F. E. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

To Nurserymen. GARMAN.—Young; respectable. Thoroughly used to Horses. Good references from army. Understands Farming, &c.—W. DILLISTONE, 1, Sparri's Cottages, Pimlico, S.W.

HOLLOWAY'S PILLS.—Indigestion.—How much thought has been bestowed, and what voluminous treatises have been written upon this universal and distressing disease, which is with certainty and safety dispelled without fear of relapse by a course of this purifying, soothing, and tonic medicine! It acts directly on the stomach, liver and bowels, then indirectly, through its own effectivity, on the brain, nervous system, and glands, introducing such order throughout the entire system that harmony dwells between each organ and its functions. Dyspepsia need no longer be the scourge of the public, since the Holloway's Pills are fully competent to subdue the most chronic and distressing cases of impaired digestion, and to restore the miserable sufferer to health, strength, and cheerfulness.

THE BEST BEVERAGE FOR CHILDREN

"CADBURY'S COCOA has, in a remarkable degree, those natural elements of sustenance which give the system endurance and hardihood, building up muscle and bodily vigour, with a steady action that renders it a most acceptable and reliable beverage."—HEALTH.

The Editor of the *MEDICAL ANNUAL* for 1890 points out that potash is largely used to add to the solubility of many of the Cocos at present sold, but that, in marked contrast, Messrs. CADBURY supply an absolutely pure Cocoa of the highest quality; and that the name CADBURY on any packet of Cocoa is a guarantee of purity.

CADBURY'S COCOA

ABSOLUTELY PURE, therefore BEST.

SINGLE DAHLIAS.—Clearance Sale.—
Fine strong plants for immediate planting out. A beautiful variety of splendid colours. Will produce a grand show in the garden this year. First-class for cut flowers. 1s. 6d. doz., 10s. 6d. per 100, carriage free for cash.

DANIELS BROS., Town Close Nurseries, Norwich.

Rare and Valuable Orchids.
MR. F. C. LEHMANN, German Consul at Popocatepec, Mexico, has entrusted me with the sale of the following rare and valuable ORCHIDS, collected by him in Ecuador and New Granada, in 1887 and 1888, all of which are now offered in perfectly established plants, viz. —
CAULOCYBA ALBA, 10s. 6d., and 15s.;
... **TRIANE,** Popocatepec varieties, 3s. 6d., and 5s.; very strong, 10s. 6d.;
ODONTOGLOSSUM CIRRHOSUM, 5s. and 7s. 6d.;
... **CRISTUM LEHMANI,** 3s. 6d., 5s., and 7s. 6d.;
... **HALDII**, 10s. 6d. and 15s.;
... **EWALI** LEHMANI, 15s. and 21s.;
... **NANTHOGLOSSUM,** 10s. 6d. and 15s.;
... **ROSELI** (Miltonia), 5s. 6d. and 15s.;
... **VEILLARIUM RUBELLUM** (Miltonia), small plants, 5s.; fine strong plants, 12s. 6d.;
ODONTIDUM KRAMI, several plants on each block, 5s. and 7s. 6d. per block;
... **MACRANTHUM,** 7s. 6d. and 10s.;
... **PYRAMIDALE,** rare and very pretty, with dense, upright spikes of golden yellow flowers, with conspicuous clear white centre, 7s. 6d. and 10s. 6d.;
... **UNDULATUM,** very rare and most beautiful, belongs to the macranthum section, 21s. and 31s. 6d.;
TRICHOPELIA FRAGRANS (a *Pezomachus* hybrid), all specimens clear white with orange-yellow eye, very sweet-scented, 3s. 6d., 5s., and 7s. 6d.

Orders will be executed in strict rotation, and forwarded, Post and Package Free, to Great Britain and the Continent. The stock being very limited, early orders respectfully solicited. Terms for cash only, either by Post-office Order or Cheque, made payable to **EDWARD ORTIGES,** Inspector of Botanic Gardens, Zurich, Switzerland.

DAFFODILS ILLUSTRATED.
(New Series.—Copyright.)
"If you want really good illustrations of our best Daffodils, there are now better than what are published by Wm. Bayler Horticulturist, Zurich, in his 'Catalogue for March, 1890.' Apart altogether from Price or Trade, I am now publishing a "Book" of 14 pages, entirely devoted to what is good among Daffodils. The drawings—many of them of Conference selections—are by my own, Gertrude Hartland and myself, which of London, and finished in a most artistic manner. Post free, 1s. 6d. The key to the same—descriptive and priced—will be published by July. Trade Circulars of Market Daffodils now being issued. Quotation special for quantity, and prompt July delivery guaranteed.—Daffodil grounds, 10 acres.
WM. BAYLER HARTLAND, Seedsmen, Aid-Carru, Cork.

CHOICE DAHLIAS.—12 New Cactus Dahlias, including Prince of Wales, Prince Albert Victor, Lady Brassey, Lady Marlsham, Black Knight, our Leader, for 6s. Also 10s. of the best selection sorts of Show, Fancy, Pom-pom, and Single, true to name, from 3-inch pots, sample dozen for 2s. 6d. Packing free for cash with order.

EST LOTHIAN ALBERTE STOCKS.
THOMAS MITCHELL and SONS offer their choice strain of the above, in five varieties, viz.: Scarlet, Purple, White, Crimson, and White Well-leafed, at 1s., 2s., 6d., and 5s. each colour. Price to the Trade on application. By Royal Warrant, Nurserymen and Seed-men to the Queen, Edinburgh.

OUTBUSH'S MILL TRACK MUSHROOM SPAWN.
—Too well known to require description. Price 8s. per bushel (15s. extra for 25 lbs. weight in packages), or 6d. per cake; free by parcel post. E. None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.
W. M. GLUXAS and SONS, Nurserymen and Seed Merchants, Highgate Nurseries, N.

BEDDING GERANIUMS, CALCEOLARIAS, DAHLIAS, AND ROSELIAS, &c. Finest kinds, from J. J. BUSH and SONS, free on application.

DICKSONS NURSERIES, CHESTER. (Limited.)

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.
DONATIONS and SUBSCRIPTIONS
Paid or Promised on occasion of the Fifty-first Anniversary Festival, June 12, 1890, on which occasion **MR. HARRY J. VEITCH, the Treasurer, will preside.**

WOLVERHAMPTON HORTICULTURAL SHOW AND FLORAL FETE.

JULY 15, 16, and 17.

Open to all England. Classes for PLANTS, ROSKS, POT-QUESTS, &c. Gentlemen's Gardeners' Classes, open to Staffords, Shropshire, Warwickshire, and Worcester-shire. Portions of the Park are closed for the purpose of the Exhibition, and applications for space should be made at once to **Mr. W. A. GREEN, Jun., Hon. Sec.,** Corporation Street, Wolverhampton.

FIFTH NATIONAL CO-OPERATIVE FLOWER SHOW, Crystal Palace, AUGUST 16, 1890.

Schedules now ready of over 25 Prizes, consisting Gold, Silver, and Bronze Medals, and £50 in cash; Special Prizes of Goods, Certificates, &c.; post-free on application to **EDWARD OWEN GREENING, Hon. Secretary,** At the Show, the Agricultural and Horticultural Association (Ltd.), offer £150 for best produce grown from their reliable One and All Seeds, 3, Agar Street, Strand, W.C., and Creek Road, Bedford, S.E.

Enoch White, deceased.
Pursuant to the Statute, 22 and 23 Victoria, chapter 35,
NOTICE IS HEREBY GIVEN
That all persons having any CLAIMS or DEMANDS against the Estate of ENOCH WHITE, late of No. 23, Holdborough Road, Bournemouth, in the County of Southampton, Nucleysman and Florist, deceased (who died on the 4th day of January, 1890, and whose Will was proved in the Principal Registry of the Probate Division of Her Majesty's High Court of Justice, on the 15th day of May, 1890, by John James Ducombe, Nucleysman and Florist, Executor, and Henry Fratt Moore, of the same place, Coach Builder, the Executors), are hereby required to send the particulars in writing of their Claims or Demands to the undersigned the Solicitors for the said Executors, on or before the 22nd day of May, 1890, after which date the said Executors will proceed to Distribute the Assets of the said Deceased amongst the persons entitled thereto, having regard only to the Claims and Demands of which they shall then have had notice. Dated the 22nd day of May, 1890.
J. AND W. H. DRUTTS, Solicitors for the Executors, Town Hall Chambers, Bournemouth.

DAILY PARCELS EXPRESS SERVICE
to the CONTINENT, and Queenborough, Flushing, Kalkreuthen.
This Parcel Service, in direct connection with the German and Austro-Hungarian services, is adapted for the rapid and regular dispatch of Plants, Bulbs, &c. No Certificate required for Germany. Tariffs free on application. Goods also accepted for Conveyance by *Petite and Grande Vitesse*.
BEST, ROYAL AND METROPOLITAN, LONDON, E.C.
Receiving Office at Habern Viaduct Station.

Rare and Valuable Orchids.
MR. RICHARD PFAU has entrusted me with the sale of the following rare and valuable ORCHIDS, collected in the mountains of the Alps, by **BARKEIRA LINDLEYANA**, or perhaps *R. SPECTABILIS*, with plants and good plants, 5s. each.
CATTLEYA DOWNLAND, small specimens, 12s. 6d.; and others, 2s. 6d. and 5s. each.
ODONTOGLOSSUM KRAMEH—According to Collector this very fine species will always remain scarce, being very rare in its native country. He says it is the Continent. The flowers are not like those of the lighter coloured variety from Chirequ. Nice plants with sound breaks 25s.; fine strong plants, 42s.
... **GEISELBRICHTE**—This very pretty and distinct var. has larger flowers, and several flowers to a spike, nice superior to type. Nice plants with sound breaks, 3s. 6d., 5s., and 7s. 6d.
ODONTIDUM ANSEFERIANI, nice specimens, only a very few, nice plants with sound breaks, 7s. 6d.
TRICHOPELIA COCCINEA TORBRUGENS—The entire lip of a deep blood-red colour, very fine var. Fine established plants, 10s. 6d. and 21s. 6d.
... **COCCINEA SUB-ALBA**—One single plant only found by collector, entire lip pure white, very faintly suffused with pink, a small blood-red stain deep down in the throat—very beautiful and distinct. Nice established plants, 10s. 6d.
... **SUAVIS SUPREMA**—The best, highly spotted variety, one established plant, 10s. 6d.
TRICHOPELIDUM HEAVIL—A pretty winter flowerer. Small established plants, 5s. and 7s. 6d.
TRICHOPELIDUM ENDRESH MAJOR, with flowers twice as large as the type—very fine. Sound bulbs in native soil, 7s. 6d.

Orders will be executed in strict rotation, and forwarded, Post and Package Free, to any part of Great Britain or the Continent. Terms for cash only, either by Post-office Order or Cheque, made payable to **EDWARD ORTIGES,** Inspector of Botanic Gardens, Zurich, Switzerland.

Many Acres of Lilies of the Valley!
T. JANNONCH, Largest Grower of LILIES OF THE VALLEY in the Kingdom, offers 3-acre, old flowering variety for cutting, 2 and 1 1/2 year old Crowns for planting out, of unsurpassed quality. Hundreds of testimonials. Time of sending out, November 1 to May 1. Prices and terms on application.

T. JANNONCH (Ld.) of the Valley Grower by special appointment to H.R.H. the Prince of Wales, Dersingham, King's Lynn, Norfolk.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Browea and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, sends the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much easier test of efficiency than when applied by hand-washing or spray—I remain, dear Sirs, yours truly." (Signed) A. MACKENZIE, of Messrs. Mathew & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "Gentlemen—I have given your Insecticide, Picrena, a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale." (Signed) B. S. WILLIAMS.

Sold by Chemists, Nurserymen, and Florists.

In Bottles at 1s. 6d., 2s., 4s., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCHAKER & CO.** Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS AND SON**, 157, Queen Victoria Street, London.

NORMAL FERTILISER

For GREENHOUSE or GARDEN.

Price—7 lb. 14 b. 28 lb. 56 lb. 1 cwt.
2s. 3s. 6d. 5s. 6d. 8s.

THE "PERFECT" SUMMER SHADING

Supersedes all Others WITHOUT WHICH NONE IS GENUINE.

For SHADING GLASS ROOFS of ALL KINDS.

Is the Cheapest. Goes four times as far as the old preparations. Note its merits described below.

Messrs. CARLTON, Contractors for the painting of the Glasgow Exhibition of 1888, write:—

"By order of the Directors we applied this Shading to the glass roofing of the Glasgow Exhibition, and found it possessed great advantages over all other preparations we had met with. Being applied cold it was most convenient to use, and while it resisted the action of the rain the whole season it was at once easily removed by gentle rubbing after wetting. It afforded a cool and pleasant shade, at the same time admitting an abundance of light."

PRICE.—1 lb. tin, 1s.; 2 lb. tin, 2s. Post-free, 4d. extra.

1 lb. tin, makes half a gallon for use.

THE "PERFECT" WEED KILLER

(Trial sample post-free.) WITHOUT WHICH NONE IS GENUINE.

Maintains its Superiority over all Rivals for permanently destroying vegetation on Walks, Carriage Drives, Ash Tennis Courts, Stone-work grown green, &c. Used at Kew Gardens, Royal Horticultural Gardens, &c. &c.

COMPLETE SATISFACTION GUARANTEED

to all using WEED KILLER bearing our Trade Mark, without which none is genuine. Refuse Imitations.

PRICE—Gallon, 2/-; 5 gal. 1/4 per gal.; 10 gal. 1/6 per gal.; 40 gal. 1/4 per gal. SPECIAL QUOTATIONS FOR QUANTITIES. Carriage paid on 10 gallons and upwards.

Holds 40 gallons. Wrought-iron frame-work neatly painted. Galvanized tubes with tap to regulate flow. Gives and sprays, 24 in. wide. Price 44 net on rail Glasgow.

SOLE MANUFACTURERS: THE **HORTICULTURAL & AGRICULTURAL CHEMICAL CO.** Works: 97, Milton Street, Glasgow.

Principal Agents: **BLACKLEY, YOUNG AND CO.**, 101, Holm Street, Glasgow.

NOTICE.—It is respectfully desired that the name of *Tombridge, Kent* be removed from the GLASGOW in January, 1887, since which time our ONLY ADDRESS has been GLASGOW.

SOLD BY SEEDSMEN AND FLORISTS.

"ROSIKA"

Trade Mark Registered.

Effective, Harmless.

Promptly clears Roses and all plants from green fly, caterpillars, spiders, and other insect pests. It recommends itself to all who have tried it for its efficiency, pleasant odour, the facility with which it is applied, and its cleanliness of action; so that anyone, however particular, can use it, and it is always ready for use. Price 1/- to 1/9. To be had through Chemists & Seedsmen, or direct from the manufacturers, **F. SCHUTZ & CO.**, 35a, Aldersgate Street, London, E.C.

Apparatus for use of Rosika, 3 sizes, 1s. 9d., 3s., and 4s. 6d.

GENUINE ROLL TOBACCO PAPER.—Strong, effective, 1s. per lb., carriage paid, for cash only. W. C. LEE, 61, Westgate, Grantham.

Three Valuable Friends.

CLIBRAN'S SHADING acts as a beautiful shade during sunny weather, but becomes almost transparent during rain—reappearing again Greenhouse Friend. As the glass dries. Unlike other preparations, it shades only at the particular time wanted. Practical growers are noting these. No expenses. Price, 1s. 9d. and 2s. 9d. per packet, post-free.

LEMON-OIL is fast superseding all other Insecticides, being cheaper, far more certain, and can Plant Friend, safely be used by any amateur. If you want beautiful foliage and healthy plants, try this. Post-free, 3 pints, 1s. 10d.; 6 pints, 3s. 3d.; half-gal., 5s. 9d.

EUCHARI MITE-KILLER.—This valuable compound enables everyone to grow and flower *Eucharia* splendidly, and has saved thousands of *Eucharia* Friend. Bulbs which otherwise would have been destroyed. See Testimonials.

Post-free: 3 pints, 1/9; pints, 2/9; quart, 4/6; 1/2 gal., 8/- from your Seedsmen.

CLIBRAN'S, Oldfield Nurseries, ALTRINCHAM; Also 10 and 12, Market Street, Manchester.

WORM DESTROYER, for eradicating every kind of Worm from the roots of large Specimen Plants, Pots, Lawns, &c. It is easily and cheaply applied, and will not harm the most delicate plant. In bottles, 1s., 2s. 6d., 7s., and 12s. 6d. each.

FOWLER'S GARDENERS' INSECTICIDE for destroying and preventing Insects, Blight, and Mildew infesting Plants and Trees. It is easily applied, either by Dipping, Spraying, Sponging, or as a Water Dressing. Does not require cleansing off with water; will not stain or injure any more than plain water; and gives the foliage a bright, clean, and healthy appearance. In Jars, 1s. 6d.; 3s. 6d., and 10s.; and in Kegs, 2s. 11s., 21s.; 5s. 11s., 42s.; 112 lb., 81s. each.

FOWLER'S MEALY-BUG DESTROYER, for the special Eradication of this most troublesome of Greenhouse Plant Pests. It is easily applied, either with a small brush or vaporiser; is instant destruction to both insects and ova, and does not stain or injure the foliage. In Bottles, 1s., 2s. 6d., 5s., and 10s.; Half-gallon, 21s.; One Gallon, 42s. each.

ELLIOT'S "SUMMER CLOUD" SHADING, for Greenhouses, Conservatories, Skylights, and all Glass Structures that require Shading Material. In packets, 1s. each.

EWING'S MILDEW COMPOSITION. In Bottles, 1s. 6d. and 3s. each; per gallon, 12s.

TOBACCO JUICE, extra strong, specially prepared for evaporating. 10s. 6d. per Gallon.

FOWLER'S LAWN SAND.

UNEQUALLED AS A DRESSING FOR LAWNS AND FOR DESTRUCTION OF WEEDS.

A trial Tin will prove its efficiency.

PRICES:—In Tins, 1s., 2s. 6d., 5s.; and in Casks, 5s. 6d., 16s., 30s.

THE WHITE ASPHODELS.

THE white Asphodel is now in flower in our gardens, and a very handsome flower it is, far surpassing in its best form anything I have yet seen in the way of Eremurus. The English name includes two or three closely allied species; there is *Aphodelos ramosus* of Linnaeus, the finest of them, found in the Spanish Peninsula and the South of France; there is *A. albus*, which extends from the Pyrenees across the North of Italy into Turkey, but which seems to pass into *A. ramosus* in cultivation; and *A. microcarpus*, which Sibthorp found abundantly in all the mountainous districts of Greece. These do not exhaust the botanical list of white Asphodels, which are found in some kindred form in nearly all the districts which are washed on the south by the Mediterranean. They are particularly abundant in the highlands and lowlands of the Pyrenees, and from the sea-coast at Biarritz to an elevation of 6000 feet or more on the mountains; both in meadow and wood the plant constantly occurs.

A few days ago, I heard of an English lady at Biarritz who innocently took some of these flowers home to her lodgings. The French landlord was wild with indignation and excitement, and insisted on their immediate removal, as they were emblems of death, and would bring evil upon the house. It is interesting sometimes to trace out the origin of these items of the folklore of plants, and I think that it may be done in the case of the white Asphodel. The oldest mention of the plant is in Homer's *Odyssey*, where Ulysses sails to the Cimmerian land of darkness, and conjures up ghosts from Hades. The ghost of the mighty Achilles came and paced majestically up and down an Asphodel meadow. There is perhaps a little inconsistency in introducing an Asphodel meadow in a land of perpetual darkness, but assuming this poetic

license, Homer selects Asphodel as an ornamental meadow flower, just as he might have selected Crocus or Hyacinth. Indeed, the same words, "Asphodel meadow," occur twice in a hymn attributed to Homer, and certainly of great antiquity, where the meadow has no connection whatever with the nether world, but was a fertile pasture in which the cattle of the King of Thessaly grazed. This shows how the words were understood by Homer, or by his earliest imitators; but as he had introduced the Asphodel into his famous and popular ghost story, the plant, at some unknown period, became connected with the world of ghosts by readers of Homer.

The next mention of the plant was by Hesiod, who lived perhaps a century later—in those famous lines which have puzzled so many matter-of-fact readers. The poet is denouncing those avaricious oppressors, who amass wealth by injustice and bribes: he says, "Foolish men! who do not know how much more the half is than the whole," and how much goodness there is in the Mallow and the Asphodel, that is in the coarsest and most homely fare. The general sentiment is that true happiness is often attained by temperance and fragility than by abundance, and that contentment is wealth. We shall see how the words of Homer and Hesiod have been misunderstood both in ancient and in modern times.

There can be little doubt that the Asphodel of Greek and Latin writers was the plant we call by the name, though it may have included yellow kinds. Theophrastus says that the roots of the Asphodel were used for food, and gives an account of the way in which they were baked and made into farina. Pliny, who translates what Theophrastus says concerning the preparation of the roots, adds, that Hesiod recommends it as a "dainty luxury!" Pliny also says, that the plant was called in Italy the King's Spear (*Hastula regia*), a name which Gerard limits to the yellow species. Gerard tells us that an ancient Greek physician, named Galen, did not believe the root could be made into palatable food, as it is astringent and bitter; but we need not suppose that it was ever a luxury, though it certainly was formerly eaten by the poor. At what date it first became suggestive of food for the dead we do not know.

In a comic dialogue of the Greek writer, Lucian, who lived in the second century of our era, and of whose works a free translation was popular reading in France 200 years ago, we find the grim ferryman, Charon, complaining that Mercury, the shepherd of ghosts, was often late in coming down below to his work. "I know," he says, "why he stays so long in heaven; he gets plenty of nectar and ambrosia there; but here there is nothing but Asphodel, and dead men's victuals." No doubt Lucian took this idea of Asphodel from Homer's story, which it does not follow that he misunderstood, though his French readers probably did. A similar notion seems to prevail in Germany. A German commentator on the passage in the *Odyssey*, writing at the beginning of this century, says:—"The Asphodel, called in German *Afodill*, was the food of the poorer classes, and used to be placed on the graves of the dead." In Miller's *Dictionary of Gardening*, Asphodelus is said to be derived from a Greek word meaning "ashes," because it used to be planted together with the Mallow on graves! This absurd suggestion probably arose out of a mixture of Homer and Hesiod in the brain of its inventor.

We may observe, therefore, that nearly a thousand years, from Homer to Lucian, elapse, during which we find nothing in Greek or Latin writers about the Asphodel in connection with the dead, though the plant is often mentioned. The poet Theocritus, who was intermediate between Homer and Lucian, speaks of it as one of the materials of a delightful bed of hay, on which he proposed to lie and drink in summer. He certainly would not have introduced it had it been in his time a plant of ill-omen, or suggestive of death, but a misunderstanding of Homer's

unlucky mention of it in his famous story of necromancy, is perhaps the remote cause of the disrepute in which Asphodel is now held in some parts of France.

P.S.—I find in Vilmorin's *Fleurs de Plaine Terre*, under *Asphodèle*, "The ancients used to plant the Asphodel round graves, in the belief that the shades of the dead feed upon its roots." *C. Wolley Dod, Edge Hall, Malpas, May 31.*

NEW OR NOTEWORTHY PLANTS.

LATHYRUS SIBTHORPII, Baker.*

I HAVE intended each summer for the last two or three years to send you a diagnosis and description of this plant, and now the intention is renewed by the receipt of a fresh specimen from Mr. T. H. Archer Hind, who grows it successfully in his garden at Newton Abbott. For garden purposes it is evidently quite distinct from *Lathyrus rotundifolius*, being in fact, about halfway between that species and *L. latifolius*. But I cannot find the name *Sibthorpii* in any botanical book, and I cannot identify the plant with any species which has been described by a botanist under any other name. What *Sibthorpe* had to do with it, I have not been able to ascertain with certainty. Probably, it was he who introduced it into the Oxford Botanic Garden, and from thence it has been distributed to other English gardens. So far as I can judge from dried specimens, we have two sheets of it, collected by Ancher Eloy (who travelled widely in the east half a century ago) near Constantinople. One of these he has labelled *rotundifolius*, and I find that I have written on the sheet many years ago "*L. latifolius* var." Boissier gives *Constantinople* as a locality for *L. rotundifolius*, but I suspect that it will be found that true *rotundifolius* is restricted to the Caucasus and the Crimea, and that this *Sibthorpii* is its Byzantine representative. The true *rotundifolius* is figured in the *Botanical Magazine*, t. 6522. It flowers a month later, and differs from *Sibthorpii* by its more numerous brick-red flowers, denser racemes, and shorter, more obtuse leaflets.

Stems twining, broadly winged. Leaflets two, oblong, nearly or quite twice as long as broad, cuspidate or subacute; stipules lanceolate-deltoid, with a large spur. Peduncle reaching a length of half a foot; raceme a little shorter, consisting of five or six laxly-disposed secund flowers. Calyx-teeth rather unequal, as long as the campanulate tube. Petals mauve-red, fading to violet; standard orbicular an inch across. Pods flat, linear, glabrous, narrowed gradually from the middle towards the base. *J. G. Baker.*

Since the above was written, Mr. Archer Hind has kindly sent me the dates at which *L. Sibthorpii* and *rotundifolius* flowered in his garden in Devonshire for four years; they are as follows:—1882: *Sibthorpii*, April 22; *rotundifolius*, June 16. 1883: *Sibthorpii*, May 19; *rotundifolius*, June 19. 1884: *Sibthorpii*, May 19; *rotundifolius*, June 16. 1885: *Sibthorpii*, May 29; *rotundifolius*, June 16.

Both at Cambridge and Dorsetshire he says that *Sibthorpii* does not grow above 3 feet in height, and can nearly or quite support itself without a stick to climb upon. I cannot distinguish from *rotundifolius* what we have received as *L. Drummondii*, but this also is a name for which I cannot find any botanical authority or description. *J. G. B.*

ODONTOGLOSSUM HYBRIDUM LEROYANUM.

Hybrid Orchids are now numerous in some of the more popular and best known genera, but the artificial production of hybrid *Odontoglossums* has hitherto proved too much for the skill of Orchid

* *Lathyrus Sibthorpii*, Baker ex Hart—Scandens, caulis 1-1 1/2 albus; stipulis lanceolato-deltoidibus; foliis unguis ellipticis, pedunculis foliis multo longioribus; calycibus dentibus lanceolatis, vel lanceolato-deltoidibus tubo aequalibus; petalis rubropurpureis; legumine linearis compresso.

cultivators in this country. Seed has been obtained and plants even have been raised, but they have either died, or have failed up to the present to produce flowers. A remarkable exception in France is worthy of notice, however, and will always possess considerable historical interest as the first hybrid resulting from artificial crossing amongst the *Odontoglossums*. This is in the collection of Orchids formed by the Baron Edmond de Rothschild, at Amandvilliers, a few miles from Paris, on the Strasbourg line. It was secured from a cross effected about 5 1/2 years ago between *O. crispum* and *O. lateo-purpureum*, the former being the seed parent. The seeds were sown when ripe, and several plants were raised, which steadily progressed until the present year, when the most advanced produced a raceme of seven flowers early in May, and these are now fully expanded, the characters indicating a true combination of the two species named.

The pseudobulbs are rounder than those of *O. crispum*, and more like those of *O. lateo-purpureum*, the larger being 1 1/2 inch in diameter and depth, and flattened, but the other is more conical in form.

The leaves are 10 to 12 inches long, and 1 1/2 inch broad, stiff, and bright green. The flowers are 3 1/2 inches across from tip to tip of the petals, and 2 inches from the tip of the upper sepal to the margin of the lip. The sepals and petals are nearly equal, the latter slightly broader, the sepals of a pale-yellowish ground tint most strongly marked at the tips. The petals are whiter, and perhaps will become still more pure. The sepals have each three broad reddish-brown bars, these being more clearly defined in the upper one than the two lower.

The petals are undulated at the margin, with one large blotch in the centre, two smaller rounded ones at the side, and a few still smaller near the centre of the base. The lip is three-quarters of an inch in diameter, somewhat like *O. lateo-purpureum* in shape fringed at the edge, white with one large reddish blotch, and a deeply divided yellow crest at the base on a reddish ground.

In general appearance, the flowers are very distinct, the sepals and petals being slightly curved forwards. Baron Edmond de Rothschild specially desires the plant to bear the name of his gardener M. Leroy, and I was informed that the hybrid will be thus named and figured in an early issue of the *Reichenbachia*. *L. Castle.*

ZYGOPETALUM JORISIANUM, Rolfe, n. sp.*

This is a very distinct and handsome species, belonging to the section *Euzygopetalum*, but quite distinct from any other in having a three-lobed and beautifully fimbriate lip, also deeply fringed column-whorls. The pedicels of the flower are unusually long, but the pseudobulbs and leaves have a general resemblance to *Z. intermedium*, Lodd. The lip is cream-white, except a broad margin on the side lobes, which is yellow, while the crest is purple. These characters impart to the plant a novel and striking appearance. It is a native of Venezuela, and was introduced by M. Bungeoth, who sent plants to the Société L'Horticulture Internationale of Brussels. It is dedicated to Monsieur G. Joris, a commissaire of the Society. A fine raceme and coloured drawing of the plant have been kindly sent by Monsieur Lucien Linden. A reproduction of the latter will appear in an early number of the *Lindensia*. *R. A. Rolfe.*

* *Zygopetalum Jorisianum*, Rolfe, n. sp.—Pseudobulbs ovoid-oblong, approximate, 2 to 3 inches long. Leaves oblanceolate, acute, 8 to 9 inches long, 2 inches broad. Racemes suberect, five-flowered. Flowers 2 1/2 inches diameter across the petals. Bracts ovate-oblong, three quarters of an inch long. Pedicels 3 inches long. Sepals lanceolate-oblong, subobtus, apex a little reflexed, pale green, heavily spotted and barred with purple-brown. Petals similar, a little broader, the markings running longitudinally on the basal halves. Lips three-lobed, each strongly fimbriate; front lobe very broad and obtuse, cream-white; side lobes yellow, except the basal part, which is cream-white; callus large, fleshy, crested, white in front, unicolor-purple on face, with about five radiating lines of same colour on either side. Column greenish-white, with numerous narrow purple-brown lines in front, and the wings cut up into a long purple fringe. Native of Venezuela.

FALKLAND PARK.

It almost sounds like some old world tale to speak of the transformation that has taken place within the last thirty or forty years in the appearance of "Norwood's Oak-clad hill." The secluded haunts of Margaret Finch and her gipsy vassals in the forest that stretched for miles along the ridge, now crowned by the great dome of the Crystal Palace, have long lost their rustic character, and form today the sites of luxurious villas, and sunny orchards and gardens. The outflow of London wealth and

the junction, bids fair in the hands of its new proprietor, Mr. McMeekin, to undergo a transformation comparable to that which the Norwood of to-day presents to that of the Norwood of half-a-century ago.

To begin with, a splendid new mansion is being erected on a commanding site, from which an extensive view is obtained in the woods and orchards of Kent on the one hand, and the sunny slopes of Surrey on the other. To one coming from the sterner scenery and ruder climate of the north, the outstretched panorama of wood, meadow, and orchard,

which it is being subjected, to become a model of its kind.

Inside the fruit garden the same pleasing evidence is visible of the interest which Mr. McMeekin manifests in horticulture, and the ability with which his wishes are being carried out by his Scotch gardener, whose extensive experience, gained at Dalkeith Palace and Kylemore, stands him in good stead. From an unkempt garden into which it had degenerated under the old régime, a few months' hard work have turned it into a garden of promise, many young trees having been planted, including Peaches, Nectarines, Apricots, &c. The healthy appearance of the trees testifies to what can be done in a good loam soil overlying clay and gravel. Near the fruit-garden is a fine plant of *Wistaria sinensis*, which is more than 100 years old [?]; and a short distance from this object is a range of old-fashioned hothouses, and then comes the new range of glasshouses, which are located on the summit of the ridge, and have a south-east aspect. It is being erected by Messrs. Mackenzie & Moncur, of Edinburgh, and differs in design from the general run of such structures. It embraces a corridor of 250 feet in length, with seven houses, intended for various collections of plants, branching off at intervals, and is furnished with every convenience for the culture of plants and fruits. *Peregrinus*.

FLOWER-PAINTING.

To paint a flower well, four things must be shown: colour, form, texture, and substance; the hue of the blossom must be rendered, its outline and the shape of its petals, the peculiar quality of the surface of these, and the degree of solidity or fragility in which their accumulation results. Then, to make a good picture with the chosen flowers, other things must be considered—as the grouping of the subject, its lighting and the general colour-scheme of which the hue of the flowers themselves forms but a part. The task, in short, is a very complicated one. If the amateur is apt to consider it the easiest he could attempt, his recklessness is explained by the fact that even a poor rendering of a very beautiful theme will attract the uncritical eye. One needs to paint admirably well to please anyone with the picture of a Potato; but a picture of a Rose, though it be but a travesty, passes for something pretty with the majority of observers.

The more experienced artist, knowing the difficulty of his enterprise, usually takes the quite allowable course of insisting more upon one side of his theme than upon the others. Perhaps he lays most emphasis upon the decorative effect of his picture as a whole, trying to do no more than indicate the characteristics of the flowers which are its most prominent feature. He arranges them in an effective mass, and insists on their coloristic beauty as related to the surroundings which he has supplied for them, leaving their form, their texture, and their substance to be divined from the hints he gives. If these hints are rightly given, if they point to the truth although they do not explain it, and if the main explanation is truthful and beautiful, the critic finds no fault with the picture. He accepts it as an interpretation of one quality which the flowers possess; and he knows that it is not needful that art should try to show more than one thing at once. Naturally, in this kind of flower painting, only such models should be chosen as lend themselves best to the special aim in view. Pæonies, Chrysanthemums, China Asters, and a hundred common summer flowers like the Eupatoriums and Golden-rods, are by Nature adapted to a treatment in which a mass of gorgeous colour is the aim, depending little upon form, texture, or substance for the beauty we find in them; and the same may be said in a lesser degree of Geraniums and of double Violets, which are good material for smaller pictures of the kind. Any one who has been familiar with our annual exhibitions will remember the delightful large water-colours of Miss Greatorex, where, very often, masses of brilliant

FIG. 116.—SWOLLEN SHOOT OF COMMON ELDER, REDUCED ONE-HALF. (SEE P. 706.)

society has taken the place of the crowds that used to seek enlightenment as to their future destiny at the tents of the famous gipsy Queen and her confederates. Even after a 10 miles ride from Victoria, you can hardly claim now-a-days to have reached the country at a point where the Canterbury pilgrims, whose adventures have been immortalised by Chaucer, might have been revelling in some rustic inn some four centuries ago, far from the noise and squalor of the capital.

But it is with Falkland Park, about a mile distant from the Crystal Palace, that we are here concerned. This old place, extending to about 40 acres, and situated on the ridge of Norwood Hill, overlooking

with a village or a spire starting out here and there, the effect is most captivating, and raises a doubt whether, unlike Byron, you could not exchange such "tame" scenes and such a climate for the storms and crags of wild Loch-na-gar.

As an improvement on the existing stretch of common brushwood, a great portion has been cleared off, and groups of Rhododendrons and Azaleas planted. The presence in the park of a number of valuable trees—such as the Red Beech, Cedar, *Acacia pseudo-Acacia*, Magnolia, Chestnut, and English Oak, assists greatly in the difficult task of remodelling a spot which, though formerly neglected, promises, to judge from the tasteful manipulation to

blossoms have been shown in the white paper cones dear to Parisian peddlers, giving a delightful picture not, in strict truth, of the flowers, but of their coloristic beauty.

It would not be wise to choose such flowers as these when effects of linear beauty are desired in a picture, but there are others admirably suited for such a purpose, like the Iris, the Amaryllis, the Narcissus, the Tigridia, and many kinds of Lilies, from the Japan Lily of the garden to the wild Lily of the fields. All these are exquisite in colour, but owe their peculiar charm even more to form. So beautiful, indeed, are their forms, that if these are sympathetically felt and faithfully rendered, colour may be entirely suppressed and still the picture be pleasing. A black and white drawing of a row of China Asters would be scarcely worth making; but such a drawing of a row of Irises might be well worth seeing. Decorative artists have known these facts in all the great building ages of the world. The Lotus, the Honeysuckle, the Iris, the single Rose and star-shaped blossoms of one sort or another have been most conspicuous in architectural ornament when it is painted as well as when it is carved.

Certain flowers are chiefly remarkable for what may be called dignity of bearing. The Gladiolus has this dignity, together with great beauty of form in the individual flowers; the Foxglove, the Larkspur, the Taberose, and the Crown Imperial have it; and the Hollyhock has it without any special elegance of form. Again, a graceful habit is the most characteristic trait, as with the Solomon's Seal, the Laburnum, many flowering shrubs, and, in a different way, the Lily of the Valley and the Poppy. Still again, an angular, somewhat eccentric manner of growth is the plant's main characteristic, as in many which Japanese artists love to paint; and flowers of such kinds should, of course, be painted so as to bring out their special qualities most clearly.

No one would paint flowers chiefly for their texture (as one might paint a piece of satin) or chiefly for their substance; these are characteristics which can sometimes be almost overlooked, and at other times be made of accessory importance. That is to say, when the picture as such is the prime consideration, when a general decorative effect is desired above all else. When we come to absolute portraiture—to the rendering of flowers for themselves, not for the part they can play in some larger scheme of beauty—then texture and substance must be as much considered as form and colour. To give the shape and tint of an Azalea blossom without giving its translucent texture, its fragile substance, would be to caricature it. To paint a Catherine Mermet Rose and not show that it is solid and heavy would be—not to paint this Rose. Naturally it is very difficult to achieve all these qualities together—to give the form of a flower exactly without making it seem hard, its colour exactly without slurring its form, its substance exactly without travestying its texture. It is so difficult, that we rarely see complete success except where the task has been simplified as much as possible. The best portraits of flowers are apt to be those where a very few blossoms of a single sort have been arranged and lighted as simply as possible. When Mr. La Farge shows us a single Water Lily he gives its form, its colour, its texture, its substance—almost its odour. But did he conceive a large group of Water Lilies, with adjuncts of various sorts, arranged and lighted so as to make a striking pictorial effect, he would probably choose some one quality of the flower for accentuation, and merely hint at the others. At all events, though success with his single blossom cannot have been easy, it would be infinitely more difficult with many.

When flowers are painted as they grow outdoors in masses, forming part of a landscape composition, then, naturally, nothing but their colour need be insisted upon, no matter what may be the dignity or elegance of their forms upon closer examination. Colour is always the quality that, as painters say, "carries furthest," remaining distinct at

a distance where forms and even habits of growth may be quite invisible.

On the average exhibition wall we seldom enough find any true excellence in the painting of flowers. Even good taste in the placing of the models, so that their peculiar characteristics might best be presented to the painter, is very rare. Gladioli are heaped together in a low bowl; double Violets are spread out in a ragged line; Hollyhocks are plucked from their stems; Pansies are strung into a frieze; rough little Chrysanthemums are stuck up stiff and single. But Roses—it is Roses that are most often attempted and most seldom portrayed. Years ago we complained that they were always too hard; now things have changed—they are almost always too soft. Their colour has been the sole concern. Achieve this, the painter seems to say, and what matter though they look as if made of a layer of cotton wool without thickness or outline or velvety surface? The worst is, that even colour cannot be achieved unless texture at least is given; we may match the tint of a Rose petal in cotton wool, but the two tints will not be the same. When, from time to time, we find evidence of an eye that has seen the whole beauty of a flower, and a hand that has had the skill to render it, then we are indeed content, though we see nothing more than one Rose on its stalk, or two Carnations in a tiny bottle. We are content, although the portrait can hardly be called a picture; just as when, on the other hand, we find a beautiful picture, we are content if it only indicates the beauty of the flowers that inspired the painter. To ask for everything together is to ask what only the greatest masters of the brush could give us. Indeed, it is doubtful whether any great master has ever given us, could ever give us, a canvas in which we should have perfect pictorial beauty of an impressive kind, and perfect portraiture of flowers as well. Yet nothing is easier, thinks the amateur, than to paint flowers. *Garden and Forest.*

TUBEROUS BRANCHES.

We are indebted to the courtesy of the Director of the Royal Gardens, Kew, for the opportunity of figuring a branch of Elder (fig. 116), from a tree growing in the garden of G. B. Longstaff, Esq., of Wandsworth. The shoot, which proceeded from one of the ordinary character, was first bent downwards and somewhat twisted as it again ascended, a circumstance which is suggestive that some check to growth was in some way or other implicated in the matter. On examination we could find no trace of fungus or of insect mischief, though it is not improbable that the originating cause of the deformity was either insect puncture or the action of frost. The illustration precludes the necessity of giving a description of the shoot—it may suffice to say that microscopical examination showed a thickening of the cortical and woody layers, although the walls of the constituent tracheids or wood-cells were thinner than usual, and their diameter, as also of the ducts, greater. The pith was greatly enlarged, its constituent cells were also larger than usual, full of liquid, but with no starch grains visible. In the case of some Laburnums sent by Mr. A. D. Webster, in 1886, similar appearances were presented, and were examined at the time by Mr. Worthington Smith (see fig. 118, p. 709). In that case as many as 500 trees were affected on one estate, and it was suggested at the time that the growth had been in the first instance arrested by frost.

Another case of like nature was sent us on one occasion by the late Mr. Webster, of Gordon Castle Gardens. (See fig. 117, p. 708).

The tubers which form on the haulm of Potato stems, and of which we have often given figures, result from the destruction by wireworm of the ordinary tubers while in course of formation. In the natural formation of tubers, the object is clearly to provide a store place for starch or other nutritive matter for future needs, but the production of tuberous shoots, as now figured, seems due to a

different cause. What evidence we have points to some injury arresting natural growth in the first instance, and then setting up irritation, and consequent overgrowth—hypertrophy.

THE ORANGE GROVES OF FLORIDA.

(Continued from p. 672.)

STARTING from New York for Florida by railway at 9 P.M., we passed several of the principal towns in the night. The country beyond these large centres of population contained very little that was interesting, and the greater part is covered with a growth of Pine, varied occasionally by swamps, where trees and vegetation generally are quite different. Occasionally a plot of cultivated land is to be seen, Maize, Cotton, Tobacco, or Sugar-cane being grown. Near many of the "frame" dwellings, attempts are made to cultivate a few trees and flowers. After passing Richmond, in Virginia, a small Bamboo is very abundant in the forest, growing under the trees, and was the only green thing seen except the Pine trees, all the grass being completely dried up—the cattle eating it, however dry it may be, and looking in consequence as poor as may be imagined. The Indian summer was over, and deciduous trees had for the most part lost the beauty of the many-coloured leaves. The country generally down here is a comparative wilderness; a few negroes are occasionally seen, standing like black statues in the fields watching the passing trains. Occasionally a fine large Magnolia may be seen near a dwelling-house; also nice specimens of Juniper, and what is called the Shade tree, a deciduous species, with large bunches of yellow berries, looking very pretty; and in the summer the handsome foliage affords a dense shade.

After passing Savannah, pieces of Spanish moss (*Tillandsia usneoides*) are seen on the trees, and the beautiful red foliage was still hanging on the Oaks and other trees. The Bamboo grows much stronger in this part, and vegetation in the woods was greener; it consists chiefly of a dwarf fan-leaved Palm. The American Mistletoe (*Loranthus albus*) is plentiful in the forest, but it was noticed as most plentiful in Virginia. The soil along the track is very sandy, and gets poorer the further we get towards the south. A species of *Artemisia*, called by the people, Dog Fennel, is very abundant, and gave the higher portions of the waste land a peculiar appearance with its bunches of dry seed-vessels. After leaving Jacksonville the scenery changes very much for the better, and rivers are occasionally seen with large quantities of Water Lilies floating near the margin. At Orange Park the first Oranges are seen, and more evergreen vegetation is to be found in the woods. Near some of the houses a few Bananas, some large Palms and Castor-oil plants, 30 feet high, were noted, the latter forming spreading trees. Although the sand is of a poorer nature down here, the Pines grow much larger. At Sanford the St. John's River is seen where it widens out into Lake Monroe, which is a beautiful lake, with some tall Palms growing in the foreground. The latter are very abundant in the woods in the vicinity, and look very pretty, especially where a good number of them are seen together in a group.

Arriving at Winter Park, Orange County, on December 5, I found the Oranges had just got their golden colour, and were eatable, and although not fully ripe, quite equal to an average Mediterranean fruit; but the Florida Oranges, when properly matured, are far better than those for flavour and sweetness, due doubtless to the greater sun-heat enjoyed in the ripening stage. I was told that the winter was both warmer and drier than usual, and I certainly found it quite hot enough on one or two occasions, when the thermometer registered 82° in the shade, and 123° in the sun. During my three months' stay very little change was experienced in the weather, and scarcely any rain fell for a period of eight weeks; it had also been dry for ten weeks

before I arrived. The thermometer as a rule went down to 53° or 56°, sometimes to 49°. The average minimum temperature from December 7 to February 16 was 53°·77, the lowest daily minimum being 48° on January 17. The highest daily minimum being 63° on January 16 and February 14. The average maximum for the same period was 76°·06, the lowest daily maximum being 61° on February 9 and 10, and the highest daily maximum 82° on February 5 and 7. I found by the records of Mr. Brigham, who keeps the signal office at Altamonte, that 95°·3 was the highest daily maximum temperature in 1880, which occurred on July 15, the lowest maximum for the year was 56°·6 in February. The lowest daily minimum was 33°·7, which occurred in January, the highest daily minimum was 77° in July; the total rainfall for the year was 47·85 inches. It will thus be seen that the seasons are very variable, but while I was at that place it was most enjoyable winter weather, and made me harbour the wish that it were possible to escape the rigours of an English winter for ever. It is usual, however, to get a large quantity of rain in January, but this year very little fell. What effect this will have on the current year's crop of Oranges is yet to be seen. Vegetation generally did not appear to suffer so much as might have been expected from the deficiency; the country is very flat, and the soil a pure sand with but little humus in it. In many places water is only 2 or 3 feet below the surface, and capillary attraction bring it within reach of shallow rooting plants.

In the early morning fogs prevail, which refresh the foliage very much; but the great want of Florida is a system of irrigation whereby the Orange groves and gardens could be watered in periods of drought, and the foliage prevented from curling up. In the driest positions, the Orange trees lost about half their leaves, which must weaken them considerably; but it is astonishing how soon they recover their freshness when a good shower comes, and one good soaking of water at the roots will keep them fresh for a period of about three weeks. The country has magnificent lakes, which are so numerous that most of the Orange groves are partly surrounded by them, so that by the aid of steam pumps and conduit-pipes to distribute water about the groves, much might be done to overcome drought.

The soil of the whole country consisting, with very few exceptions, of pure sand, a large amount of manure is required to support a crop of fruit. The mixing and distributing of chemical manures appears to be a very profitable trade, judging from the number of mixtures advertised at more than double their value, and each claiming to be the best Orange fertiliser. Prices range from 24 to 45 dols. per ton on rail, notwithstanding a good mixture can be made for 31 dols., or about 47 per ton, by purchasing the ingredients separately. A good dressing, say 5 cwt. per acre, should be given in December or January, and repeated once or twice during the growing season. In winter it is generally scattered, sown broadcast, and ploughed in, but at other seasons it is not possible to use the plough without injuring the feeding rootlets of the trees which are very near to the surface, and it is therefore scratched into the surface with the harrow, and left to the action of rain to wash it down to the roots. Stable manure is sometimes made use of, and a moderate quantity of this is beneficial, whilst too much of it causes strong, sappy growth, liable to be attacked with "die back," a disease of the young growths, which causes them to turn black and die, moreover it causes softening of the rind of the fruit, in which state it does not pack well.

Any manure containing a large percentage of nitrogen will cause the above disease, and if fowls are allowed to roost in the trees continually it will soon appear. This seems to be the only disease which troubles the Orange tree in Florida, insects not affecting them much. The only insect I observed was the mussele-scale, but trees that are well manured are not much affected with it, but Orange groves which are not well cultivated get very yellow and sickly-

looking, especially if fertilisers are not put into the soil in sufficient quantities.

It is easy to see at a good distance away what is the kind of cultivation pursued, and occasionally I saw a grove that had been neglected for several seasons, and in which the trees generally bore only a small crop of poor fruit. Decayed vegetable matter, taken from the swamps, and locally called "muck," is sometimes applied to the trees with very beneficial effects. Some growers consider the soil is much enriched if they leave the wild grasses and weeds after June to make their growth, ploughing them in during the winter when all is dead and dry; others use green manure with "Cow Peas"—a kind of dwarf French Bean—which is sown and ploughed in like the weeds, but a very large amount of this kind of vegetation must be ploughed under before the sand is much improved. There are growers who keep their groves clean all the year round, obtaining good results with certainly a better appearance. Seedling Orange trees are found to be the hardier, and eventually give the more satisfactory returns, although they are much longer in reaching the fruiting stage than budded trees, and varying a little in the character of the fruit. The seedlings are supposed to belong, as a rule, to the Round Portugal variety of the Orange. The Navel, Mediterranean Sweet, Maltese Blood, Jaffa, Majorca, Mandarin, and Tangierine varieties, are also grown as budded trees; and many other varieties have been tried by some persons, and especially by General Sanford, at B-lair, but the majority of the trees in the groves consist of seedlings. These latter do not bear much until the 15th or 16th year, when a single vigorous tree will carry a crop of 1000 to 1500 fruits. These trees are generally planted at from 25 to 30 feet apart each way, and when they reach the age of 20 years old and upwards, they are from 30 feet to 40 feet in height, and form a picture of much beauty when laden with ripe fruit.

Budded trees will bear at two years' old, and keep on increasing in the amount of their crop until the seventh or eighth year, when a full crop may be expected. It is not advisable to let budded trees fruit too soon, as early fruiting prevents the growth of healthy shoots. Budded trees are planted closer than are seedlings, the reason being that they never get so large as those, and especially is this true of the Mandarin and Tangierine varieties, the latter one of the prettiest of Oranges when seen in the growing stage, and a good-sized tree full of its bright orange-scarlet fruit being a sight not readily forgotten. These two varieties are of a much smaller size than any others; but the trees are very prolific, and the fruits fetch good prices—the latter being worth three times as much as ordinary Oranges. On one tree of the Mandarin, at Mr. D. Holden's grove, near Altamonte, I counted 400 fruits—this tree was 15 feet in diameter and 12 feet in height. Mr. Holden, who took the management of this grove early last season, found that it had been much neglected; but he has by liberal manuring secured a good crop of fruit on some of the trees, and clean growth on all of them.

A quantity of strong shoots spring from the old wood in the centre of the tree during the growing season, which grow at a tremendous rate, soon weakening the other parts of the tree if not kept in check. These shoots are called water-sprouts, and the cutting out of these shoots is about all the pruning that an old tree requires. Young trees, on the contrary, require much attention to keep a well-balanced head, and the centre of the tree free from crowded shoots.

Most Orange trees are grown in the same form as our standard Apples. The flowering season commences in February, and the fruits are not thoroughly ripe until January following, except in a few favoured districts. Many growers, however, are anxious to get their returns as soon as possible, and gather their fruit as soon as it is coloured, thus glutting the markets with inferior fruit, and getting Florida Oranges a bad name, because the flavour is not developed. The fruits are cut

from the tree with scissors, the men standing on ladders and putting the Oranges into bags which are strapped over their shoulders; and they are then taken to the packing house and placed in the receiving bin in readiness for the sizing machine, which classifies them for packing into about six different sizes. The man who attends to it also sorts them at the same time into brights and russets, the latter being unlike the Oranges we are accustomed to see in England, being more or less brown on the outside, and for that reason do not find favour at present in the English market, buyers thinking probably that some accident has happened to them. The Florida folk prefer these russet fruits, and retain a good number for home consumption, considering them superior in flavour to the showier fruits, and they also sell well in the towns in the north, but fetch rather smaller prices than the bright fruits. What causes this peculiar russet appearance is a disputed point; some attribute it to insect agency, others to a deficiency of some chemical element in the soil. I think the latter will prove to be the real cause, as I was told the groves in "Hummock" land—where a large amount of decayed vegetable matter is present—grew bright Oranges at first, but eventually only russety ones; also those groves which are not so well cultivated, invariably have the greater part of the crop russety. After the fruits have been sized by the machine, they are wrapped in tissue-paper and packed in boxes 2 feet 2½ inches long, 12 inches wide, and the same in depth, which hold ninety-six of the largest fruits—which are very fine—and 200 of the smallest size, with several intermediate numbers—good sizes for general use are 150 and 176. The boxes are bought in pieces cut to the proper size at the lumber-mills and are made up on the premises; and each size has to be packed on a certain plan or the proper number cannot be got into the boxes, diagrams showing how this may be done are circulated by the Florida Fruit Exchange, and some other agencies. The fruit is sent to the large towns in the north, some of the growers consigning their fruit to commission agents, a plan of selling which requires great caution, as there are numbers of adventurers among the latter, but of late years the Florida Fruit Exchange has handled a large portion of the fruit. This Company has deposits in several of the largest cities and in Florida, and endeavours to secure the best prices by sending to whatever market has the greatest demand at the time. Prices vary from 6s. 3d. to 12s. 6d. per box for the ordinary kinds; Scarlet Tangierine fetch 2s. per box. Some growers sell the crop on the trees at 1 dol. or 4s. 2d. per box, the buyer to gather, pack, and market it himself; this is considered a good paying price; and doubtless it is so, if a good crop can be ensured, as it is possible to grow 500 boxes and upwards per acre, but to secure a result like this, the grove must have the very best attention continually. *W. H. Divers, Kotton Hall Gardens, Stamford.*

(To be continued.)

PLANT NOTES.

OCHNAS.

THE members of this genus are far from being common in cultivation, though the flowers are pretty and attractive. Perhaps the greatest drawback to their popularity is in the fact that the flowers (petals) are very fugacious. Ochneas are not difficult to cultivate, and anyone with a stove at command may succeed in growing and flowering them satisfactorily; one great point being to mature the shoots, for, failing this, few flowers appear. In potting make use of well-drained pots, and a compost consisting of peat, a little turfy loam, and a sprinkling of sharp sand. Ochneas are readily increased from seeds or cuttings; and when the latter method is employed, short, half-ripened shoots should be chosen, putting them in sandy, peaty soil, and placing them, with a bell-glass over the pot, in

a gentle bottom-heat, attending to shading and syringing until rooted.

O. multiflora.—This is the commonest in cultivation. The petals are yellow, and soon drop off, but as a compensation the sepals and receptacle assume a bright crimson colour, and the latter increases in size, and resembles to some extent the fruit of a Strawberry. Upon this receptacle black fruits are borne, which form the chief attraction. These fruits, if gathered, dried, and sown, soon germinate, and in a year or two make stocky young specimens. The stems of the plants are covered with warty excrescences, the growth is slender, and the leaves, of a bright green colour, are elliptical in form, with serrated margins.

O. atropurpurea.—Some few years ago an Ochna was sent to the Cambridge Botanic Gardens under the name of *O. Kirkii*, but which, without doubt, may be referred to *atropurpurea*. It is a much larger plant than *O. multiflora*, and the habit is stiffer. The flowers measure about 2 inches in diameter: the colour of the petals is a beautiful soft yellow; the calyx and receptacle are of a dark purple colour; and the sepals are ovate. The leaves are ovate, with a finely toothed margin; the tips of these teeth are glandular when the leaves are in a very young state, the glands resembling those on the tentacles of a *Drosera*.

O. arborea.—Under this name seeds were received from the Cape of Good Hope, some three or four years ago, and one plant has been raised. This plant is quite distinct in habit and foliage from the other species named, but as it has not yet flowered, I cannot say more about it.

ACACIA FULCHELLA.

The above is one of the prettiest of greenhouse plants. The habit neat, compact, dwarf, and very floriferous. The flowers, yellow, appear as tiny balls, produced to the number of one, or two, or more, from each node. The stems are thinly covered with small hairs, and prominent reddish-brown spines. The leaves are small, five to seven leaflets upon a pinna, which are excellent examples of sleep movement, a fair rival for the so-called Weather-plant, *Abrus precatorius*. Propagation is effected by means of cuttings of small side-growths with a heel, put into light sandy soil, surfaced with sand, and covered with a bell-glass. The cutting-pot should be stood in a shady position in the greenhouse or frame, and with ordinary attention the cuttings will form roots in due season. At Chatsworth I noticed a very fine plant of this species trained against the corridor wall, and which, when in flower, must be very attractive. *W. Harrouc*.

ORCHID NOTES AND GLEANINGS.

LELIA PURPURATA VAR. RUSSELLIANA.

This beautiful and rare variety is now in flower at Clare Lawn, East Sheen. The plant has shorter and thicker pseudobulbs, large flowers with white sepals suffused with lilac, petals rather narrow and slightly deeper colour and broader, lip large, rosy-lilac, with a band of light rose near the yellow rose-pencilled throat. The plant has not flowered with us until now, from which it may be inferred that it is a shy bloomer. *W. H. Y.*

ODONTOGLOSSUM SANDERIANUM.

A winter-flowering species, native of Venezuela, where it grows on the high mountains, so that it can be grown here in a winter temperature of 60°, and in a summer temperature of 60°. Water should be freely supplied during the growing season, light and air should be freely admitted to ripen the bulbs. *Reichenbachii*, t. 91.

CATTLEYA MORGANII.

A freshly imported plant of this delicately beautiful form of *C. labiata* Mendelii in flower for the first time in the collection of R. B. Cater, Esq.,

Henrietta Park, Bath, is identical with the type; the sepals and petals being pure white with a faint pearly tinge on the lower halves of the former; the lip, beautifully fringed, is narrow, tubular, pure white with a blotch of bright magenta on the front, and a shade of clear yellow with dark reddish lines running up the throat to the base of the lip. It is superior to the medium forms of *C. Mendelii*, and forms an admirable contrast to the best high-coloured varieties. *J. O'B.*

ODONTOGLOSSUM SCHRODERIANUM.

Mr. Sander distinguishes this from *O. laeve* by its smaller pseudobulbs and the deeper colour of the flowers. It is a native of Central America, and was first flowered in this country by Baron Schröder. It is best grown in well-drained pots in a compost of fibrous peat and sphagnum, and should be placed near the glass to obtain as much light as possible without subjecting the plant to the direct rays of the

FIG. 317.—THE BROAD, PENDULOUS BRANCH OF LABURNUM (SCALE 1/2).

sun. In summer the *Odontoglossum*-house, and in winter the cool end of the *Cattleya*-house, will suit the plant. The approach of winter is the signal for reducing the amount of water as much as possible consistent with due care. *Reichenbachii*, t. 95.

CATTLEYA MOSSIE ALBA.

There are several very beautiful forms of *Cattleya Mossie* with white segments, and some slight variations in the markings of the lip, which seem to render them distinct from a florist's point of view. A very beautiful variety is in the possession of A. Wilson, Esq., of Westbrook, near Sheffield, and of which a flower has just been sent to Kew. It measures fully 7 inches across from tip to tip of the petals; the segments are of the purest white, and the colours of the lip are very brilliant. In front of the bright yellow disc it is beautifully marbled, and veined with rich crimson-purple, outside of which is a broad white crisped margin. The plant was purchased from Messrs. Backhouse & Son, of York, and is said to have thirty-four pseudobulbs and six leaves. It is certainly a very beautiful variety. The earliest ap-

pearance of a white *Cattleya Mossie* seems to have been in 1850, in which year a plant flowered at Syon House, and was figured in Paxton's *Flower Garden* as *Cattleya labiata candida*. *C. Wageneri* appeared in 1852, and *C. Reineckiana* two years later, and both have since been placed as varieties of *C. Mossie*. Then came *C. Mossie alba*, and finally *C. Reineckiana bella* and *C. Reineckiana superbissima*. *C. Wageneri* is wholly white, with the exception of the small yellow disc of the lip, the others have a greater or less amount of crimson-purple veining in addition, but they differ from each other in very trifling characters. *R. A. Rolfe*.

CATTLEYA LABIATA WARNERI.

The flowering season of this variety begins in June, when that of *C. Mendelii* is over, and lasts till that of *C. Gaskelliana* begins. This variety is especially suited for growth in baskets: it begins to grow in winter when a day temperature of 70° to 75°, falling to 60° at night, may be given. A moist atmosphere is necessary, and copious waterings during the growing season. Even during the resting period, when the temperature is lowered, care should be taken not to allow the bulbs to lose their plumpness. *Reichenbachii*, t. 95.

MILTONIA VEXILLARIA AT WADDESDON.

Few Orchids excel this superb species in floriferousness and showiness of character. At Waddesdon, the whole side of one of the Orchid-houses is occupied with plants of this grand free-flowering Orchid. Mr. Jaques, the head gardener, has evidently studied this plant with great attention, and has succeeded in a remarkable manner, the plants being clean, robust, and well rooted; as a natural consequence, the blossoms are large, and of great substance. The varieties most in favour at Waddesdon are those with white and deep rosy-red flowers, and all those known as radiated forms, as well as those having barred sepals and petals. All the Baron's plants are selected for excellence—some of his other, others of colouring, substance of flowers, &c; hence, much variation from the normal type is to be seen. On the occasion of the recent visit of Her Majesty, the whole of the lunch table was decorated with *Miltonia vexillaria*. By candle or gaslight, only the deep rosy-red kinds are really effective; but for the afternoon tea or lunch table, the exquisite colours of the lighter forms are most charming. The bouquet presented to the Queen consisted of *Vanda teres*, interspersed with *Odontoglossum Pescatorei*. Mr. Jaques deserves great praise for the skill in making the floral arrangements carried out in the mansion and elsewhere, all of which were under his personal superintendence, and which were much admired by Her Majesty and all the guests present on the occasion. *Verrill*.

CATTLEYA ELORADO CROCATA.

Petal-segments white, lip white, undulate at the margin, and with a large orange-yellow blotch on the disc, extending into the throat. It was first introduced by Mr. Sander, but was discovered by Wallis in the Valley of the Rio Negro, Northern Brazil. The conditions under which Mr. Sander cultivates it are a maximum temperature of 80°, a minimum of 60°, the atmosphere being kept in a moist condition. The plants should be placed in well-drained pots in a compost of rough peat and moss, with a little charcoal or crocks mixed, so as to keep it open. In this condition "any amount" of water may be given in the growing season, the amount being gradually diminished after the bulbs are fully developed, and more air given. In winter, water should be given occasionally to keep the bulbs plump. *Reichenbachii*, t. 93.

SAMBUCUS NIGRA, ARGENTEA VARIEGATA.—Plants of this Elder, together with those of *S. nigra* var. *aurea*, and *S. racemosa*, are very effective, either planted as specimens in the grounds, or associated with other shrubs, the variegated and golden leaves of the first-named two varieties, and the scarlet fruit of *S. racemosa*, contrasting very effectively with the dark green leaves of the evergreens surrounding them.

BERWICK, SHREWSBURY.

In a commanding position on the crest of one of the hills, which add beauty to the environs of Shrewsbury, and 2 miles distant from the town, stands the fine mansion of James Watson, Esq., M.P. The estate, several square miles in extent, has a garden of proportionate size, in which of late years Mrs. Watson, whose taste in horticultural matters is well known, has been continually carrying out plans for embellishment. In these concerns the landscape gardener has not been followed too close, but originality in design and execution. Turning from one front of the mansion, a pleasing result of this originality is observed, the geometrical Italian flower garden, which in many places is too often filled with glaring bedding plants in the summer months, and left bare for the remainder of the year; here, a geometrical garden is transformed into an alpine and herbaceous garden, which affords a fine display of varied flowers for the greater part of the year, and is never quite without them. The borders around, and the beds arranged as rockeries, natural rock being employed, are planted with species of plants suitable to the situations they occupy—here a marsh bed of *Iris Kämpferii*, there a patch of *Cyripedium spectabile*; on the drier rocks large cushions of dwarf *Phloxes*, *Arabis*, and *Alyssum*, relieved by the purple hues of the *Aubrietias*; beyond, perhaps, lies a clump of *cærulea Gentians*; and around the borders are *Irises*, *Pyrethrums*, *Potentillas*, and many another plant, worthy of a place in such a garden. Every hour that a garden so planted is visited some new and charming object is to be discovered.

From another front of the house a fresh scene of beauty is disclosed: terraces at four different levels, connected with each other by flights of stone steps, and a walk in the middle, flanked with *Juniper* bushes, which, being low, are admirably fitted for the position. On the lowest level, and also on the slopes to the left, which run on towards the *Rhododendron* dell, is some neat scroll-work with bedding-plants; the *Rhododendron* dell, by the way, being brightened by the presence of some large clumps of the yellow *Azalea atcaulensis*. To the right are giant *Beeches*, and a single *Walnut* tree, beneath whose shade a rich green carpet has been produced by sowing Carter's lawn grass seeds in March, and strewing moss litter over it after the seeds had been raked in. Beyond this point, a winding walk with a *Rose* arbour extends away to the right past many lovely bits of arrangement to the river Severn, whose bank at this position of its course are planted with fine shrubs and patches of *Narcissus* and alpine plants, while the native plants are only restricted, not treated as weeds. The beauty of the *Lychnis*, *Veronica*, *Myosotis*, *Celandine*, *Daphne laureola*, and other British plants renders them no mean rivals to the exotic stranger; and a constant succession of groups of these native flowers may be found in this seemingly endless and delightful walk by the river side.

On a still lower level than the terraces, its architecturally beautiful arched front, forming the face of the lowest one runs the colonnade; whose clustered pillars furnished shelter, rest, and grateful shade. A low wall is built in curves, with buttresses of red stone at each curve, and forms the lowest step of the garden on this side, and is another very pretty feature, and one which with time will be rendered a charming object.

Between the stones *Saxifragas*, *Linarias*, *Aspleniums*, *Sedums*, and other suitable plants are placed, most of which have taken well, and some were in flower. On the lower level a broad walk flanked with *Cypressus* passes through what is termed the spring garden, which was gay with *Wallflowers*, *Pansies*, &c. Throughout the grounds generally, where all things are kept in splendid condition, many noteworthy objects strike the visitor, notably the fine proportions of the *Rhododendrons*, many of them 20 or 30 feet in height; the *Portugal Laurels* well trimmed, but not clipped, but cut over with the

knife, equal these in size and beauty; and everywhere noble *Conifers* testify to the good soil and healthy character of the district. The *Tree Peony* flourishes here; one specimen which was noted had more than a hundred flowers upon it. *Azara microphylla* becomes a grand object, either as a bush or on a wall; *Aralia Sieboldii* is hardy here, and grows into fine clumps; and at the end of the shady spring walk, so fresh with its grassy path and spring flowers, the Japanese *Maples* form a fine contrast to the more massive foliage around them. Another feature in this fine garden is the clothing of all available spaces—walls, tree-stumps, garden-houses, and pillars with climbing plants, a great variety of which—many of them uncommon—are employed for

FIG. 118.—THINNED SHOOT OF LABURNUM. (SEE P. 706.)

the purpose, as the varieties of *Ceanothus*, just now a fine display; the white, pink, and red *Cydonia japonica*, and the pretty *C. Maulei*; *Clematis* in profusion, *Forsythias*, *Menispermum canadense*, *Muhlenbeckia complexa*, *Ficus stipularis*, and many other subjects usually to be found in the greenhouse. The beauty and completeness of these many gardens in one cannot be too highly spoken of, and truly Mr. Alfred Gaut must have calls on him which only his ability and steady perseverance could enable him to meet.

THE GLASS-HOUSES.

For plant and fruit-growing, are numerous. In one of the former was a fine show of *Calceolarias*, *Pelargoniums*, *Marguerites*, *Begonias*, &c., with the singular yellow *Senecio macroglossus*, which has been flowering all through the winter; and *Trachelo-*

spernum jasminoides, the latter a twiner, on the roof.

Another range, consisting of two divisions, contained specimen *Ferns*, *Palms*, *Crotons*, *Dracaenas*, *Allamandas*, &c.

A fernery with a back wall, rendered beautiful by being mossed and planted with a pretty collection of *Ferns*, contains many rare and well-grown species on the front stages. In another house the *Roses*—*Niphotes*, *Maschall Niel*, &c., are blooming profusely, and on its back wall *Heliotrope*, *Cianthus*, *Plumbago capensis*, and *Hydrangea stellata*—a grand object, with about 250 heads of bloom.

The vineries form a range of four divisions, each filled with heavy crops of fruit in various stages of development, and many of the bunches fit for exhibition. The house for forcing *Peach* and *Nectarines*—one of them nearly 200 feet in length, were furnished with clean healthy trees well cropped; and the *Melons*, *Cucumbers*, *Strawberries*, &c., were as they should be. To get a succession of *Melon* fruits from one house, a plan is adopted of not constructing a continuous bed, but dividing it into divisions with cross-boards, planting each division in turn. Fruits in all stages, and plants not yet in bearing, give evidence of the success of the plan.

For remedying defective ventilation, Mr. Gaut has a most successful method, which he has applied to every house requiring it—it consists of running a drain, with ventilating openings in it, up the middle of the house from end to end, with openings into the outer air at the ends, and also with pipes at intervals from the front outside to the drain inside, the openings being capped to allow of the ventilation being regulated. The adoption of this plan would render many an unmanageable ill-ventilated old house better adapted for plants.

The kitchen gardens are in every way worthy of the other parts of the establishment, and the whole gives a good example of money and labour well applied.

THE GENUS SCAPHOSEPALUM.

The species of this curious little genus were formerly referred to *Masdevallia*, under which name several of them appear in various collections. They do not, however, agree well with the characters of that genus, and Professor Pfitzer has recently proposed to separate *Masdevallia ochthodes*, Rehb. f., and *M. verrucosa*, Rehb. f., under the name *Scaphosepalum*, in allusion to the scooped-out, or boat-like arrangement of the lateral sepals. In the May number of the *Journal of Botany*, I have pointed out that seven other species must also be transferred here. The genus thus comprises the following:—*S. anchoriferum*, *S. breve*, *S. gibberosum*, *S. macrodactylum*, *S. ochthodes*, *S. pulvinar*, *S. punctatum*, *S. swartzifolium*, and *S. verrucosum*—all of them formerly bearing the same specific names under *Masdevallia*. The removal of these species, which are always readily distinguished by their inverted flowers, leaves *Masdevallia* a far more natural and definable group. Another very remarkable species has just appeared, which is described in the following note:—

SCAPHOSEPALUM ANTENNIFERUM, Rolfe, n. sp.*

A highly curious species, and the first very close ally of *S. pulvinar*, Rolfe (*Masdevallia pulvinaris*, Rehb. f.), which has yet appeared. As in that species, there is a very remarkable fleshy pulvinus or

* *Scaphosepalum antenniferum*, Rolfe, n. sp.—Plant caespitose. Leaves elliptical, long petioled, rigid, bright green, 3 to 8 inches long, 1 to 1½ inch broad. Scape 18 inches high, dark dull green, and strongly verrucose, producing numerous flowers in succession. Bracts orbiculate below, with a rigid fleshy apex, similarly coloured to the scape, but far less verrucose. Flowers 8 to 9 lines long, dull greenish-yellow, the sepals dotted and lined with dusky purple-brown, the pulvinus being covered with minute dots of a lighter shade, antennæ greenish-yellow. Petals obliquely ovate, acute, deep yellow. Lip indistinctly three-lobed, side-lobes narrow, truncate above, front-lobe very obtuse; colour yellow, with numerous minute purple spots. A pair of linear, somewhat fleshy keels extend from base to above middle. R. A. Rolfe.

cushion on the united pair of lateral sepals, though differing in shape and colour; while in habit the two are almost precisely alike. But the present species has one or two very important differences. In *S. pulvinata* the lateral sepals are acute, nearly straight, and scarcely at all divergent at their free points, while in *S. antenniferum* the apex of the united sepals is broad and truncate, while the free portions are sharply reflexed, very slender, half an inch long, and gracefully curved underneath the basal portion, the whole resembling the head and antennae of a good-sized centipede. The character is so striking that I doubt whether a more appropriate name could be found. It was imported by Messrs. Charlesworth, Shuttleworth & Co. (I am not sure from what locality), and the specimen now described has passed into the collection of R. I. Measures, Esq., of Camberwell. *R. A. Rolfe.*

THE CULTIVATION OF ECONOMIC PLANTS IN CENTRAL AFRICA.

CONSUME HAWES, some time since, says:—"Of the natural productions of the Nyassa territories, Rubber, Indigo, Strophanthus, and fibre-yielding plants, may be named as offering a possible means of trade, though I cannot say that the prospects are very encouraging." Rubber might, under proper treatment, have become a profitable export. It is now found in very small quantities, and, indeed, it can scarcely be considered worthy of attention. This is undoubtedly owing to the destructive method the natives have of extracting the juice. At Mount Zomba, *Landolphia florida* was found in abundance, but now the plant is almost exterminated. Rubber of this species sold in Africa last year for Is. 6d. per pound.

The cultivation of rubber-yielding plants in this part of Africa is at present attracting the attention of Europeans, and a plant of *Ficus elastica* is said to be growing luxuriantly in a private garden, the owner of which intends to propagate it largely. Indigo grows wild all along the slopes of Mount Zomba. It forms a large bush, and is perennial. It is of luxuriant growth, and its cultivation and manufacture might probably be undertaken with advantage.

Speaking of the now well-known Kombe disease (Strophanthus Kombe), Mr. Hawes says that during 1886 over 1100 lb. of the seeds were exported from the Nyassa districts, and realised in the London markets 9s. per lb. The supplies hitherto obtained have been drawn from the right bank of the river Shire, below the Murchison Rapids. The Strophanthus is a strong climbing plant, and is always found in the vicinity of high trees, on which it supports itself. The stem averages a few inches in diameter, and lies on the ground in folds, the branches supporting themselves on the nearest trees. The fruit grows in pairs, and have the appearance of a pair of large horns hanging to a slender twig. The fruit begins to ripen in July, and lasts till the end of September. The native method of preparing the poison is very simple. They first clean the seeds of their hairy appendages, and then pound them in a mortar until they are reduced to pulp; a little water is then added, and a gummy substance obtained from the bark of a tree, which helps to keep the poison on the arrow in the event of its striking against a bone. The poison thus prepared is spread upon the arrow, and allowed to dry. Game wounded by arrows poisoned with Strophanthus die quickly. The flesh is eaten without any injurious effects. The juice of the Baobab bark squeezed on the wound made by the arrow counteracts the evil effects of the poison. Buffaloes and all smaller game are killed by it.

Referring to coffee planting as a source of export, Mr. Hawes says:—"Promising as the culture seemed to be two years ago, the result hitherto has not realised the expectations of the planters, and though the quality of the coffee grown at Zomba has been established beyond doubt, still, more experience is required before it can with certainty be said whether the cultivation of coffee will be successful or not. The crops grown last year, both in the Mandala and

Zomba districts, were to a great extent rendered unreachably by the berry becoming diseased just before reaching maturity, the same disease showing itself again this year. The cause is partly attributed to allowing the trees to bear too profusely.

In coffee culture, the difficulty of obtaining labour presents a serious obstacle. At the season when the planter requires a large supply of labour, to keep down weeds and plant out new ground, the natives are all employed making their own gardens, and will do no other work. Proprietors of small plantations may, with their few permanent hands, tide over the difficulty till workers can be obtained; but the question of labour forms a serious consideration, and will tell greatly against any foreign enterprise on a large scale being successfully carried out in Central Africa. Another drawback to the prospects of coffee planters is the heavy transit freights to the coast. Until competition brings about a lower rate of charges, a serious barrier is opposed to the development of European enterprise in these territories.

In favour of the cultivation of coffee, it may be stated that land with suited soil can be purchased cheaply. Though unlimited acreage of good soil may be unobtainable, still sufficiently large areas to justify planters in establishing plantations can readily be got. At present about 90 acres of land in the Zomba and Blantyre districts are under coffee cultivation, a considerable portion being new plantations formed this year.

A few tea plants have been introduced and grow fairly well, but as yet nothing definite can be said of the prospects of tea plantations. In the highlands it is doubtful whether the cultivation would ever prove successful, and the uncertainty of labour would render it a very precarious undertaking.

Cinchona has been introduced, and shows every prospect of its cultivation being a success from the fact that plants three years old are now 6 feet high. It remains to be seen whether the quality of the bark will justify the planter's investment of capital, and whether the state of the market will offer encouragement. A small plantation of 1000 plants was formed last season at Zomba.

SCOTLAND.

THE INTERNATIONAL EXHIBITION, EDINBURGH, 1890.

(Continued from p. 576.)

SINCE the opening day, many finishing touches have been added to the adornment of the grounds, enhancing their beauty and interest much. The colonnade of the crescent-shaped colonnade leading from the gateway to the grand entrance have been flanked with fine specimens of Sweet Bay and Cupressus Lawsouiana, which are placed alternately in tubs covered with virgin cork, and resemble portions of the trunks of giant Oaks. The arches of the colonnade are further decorated with hanging baskets filled with Ferns, Ivy, and flowering plants, imparting a light and elegant drapery to the not unpleasing lines of the structure. Altogether the grounds present a charming appearance, and afford to the visitors a promenade of great beauty and variety.

Greenhouses, boilers, sunnerhouses, &c. — Several local horticultural builders have erected greenhouses. Taking the exhibits in their order as they occurred in my passage round the grounds, Messrs. Peel & Sons, of Edinburgh, London, and Dublin, have a pretty amateur's greenhouse, span-roofed, and altogether well constructed and proportioned for plant growing. A heating apparatus, invented by the firm, and adapted to heat the house, is erected outside of it. The boiler somewhat resembles the "Loughborough," "Stourbridge," and other similar slow-combustion boilers intended to heat an amateur's greenhouse, and is set up in the same manner, the body of the boiler being placed inside the house, and the furnace front only is exposed outside.

Messrs. Reith, Hardy & Co., Edinburgh, exhibit

an excellent combination amateur's greenhouse and propagating-house, well adapted for either plant growing or propagating. The house is span-roofed, and on one side a tank-like bed, about 20 inches wide, runs the entire length; the other wall of the house, and one composed of cement and grit 3 inches thick, built about 2½ feet high, forms the retaining wall of the bed, and also the boundary of the passage. If to be used for propagating, bottom-heat can be supplied with hot-water pipes laid in the bed, and the surface be closed in with squares of glass. Should the bed not be required for propagating, it may be filled with soil, and climbers be planted therein.

A twin-saddle boiler, the invention of the firm, appears to be a good thing where much power along with slow combustion is wanted. The boiler is a large one, with a wide span, and the distinctive feature of the invention is a waterway midfeather, extending from front to back, and from the crown of the boiler to the furnace-bars, thus cutting the ordinary furnace space of a simple saddle boiler of the same dimensions in two equally, so that there are actually two furnaces within the boiler in place of one in ordinary. Clearly such an arrangement is only adapted to boilers of a large size. The advantage claimed for the midfeather waterway is that besides the greater heating surface it presents, it conduces largely to the maintenance of a steady temperature during the night, with a minimum of labour in stoking, and in the consumption of fuel.

In connection with this subject, I learn that it is on the tapis to organise a horticultural boiler competition, to be held in the grounds sometime—probably on the occasion of the Edinburgh Agricultural Society's show—during the course of the summer. The idea has originated with the local horticultural builders themselves, but it would be well if the competition were opened up to all comers.

Mr. John Petrie, Freer Street, West Fountainbridge, Edinburgh, has a very neat amateur's greenhouse, in excellent proportions, and well adapted to plant culture, which, on a larger scale, would make a very handsome conservatory, with every requirement for healthy plant growth, being very light, and amply ventilated.

Messrs. D. Low & Sons, of Edinburgh and Manchester, have a handsome cruciform conservatory, which is a well-proportioned, and very substantial yet light structure. This firm exhibits also some capital span-roofed frames—a specialty—and various boilers, garden seats—also a specialty—and a very elegantly-fashioned heating coil case in cast metal, painted bronze, and having a marble top. The design is their own, and remarkable for its light and elegant appearance, while effectually concealing the pipes within.

Messrs. McKenzie & Moncrie, Edinburgh and Glasgow, have a very pretty conservatory, suitable for a villa residence, along with exhibits of boilers, frames, and garden seats. The house was well filled with flowering and foliage plants by Messrs. J. & A. Seth, florists, Edinburgh, who were doing a brisk trade in cut flowers and plants with the admiring public.

Summer-houses, arbours, and rustic seats are very numerous, and judiciously disposed throughout the grounds, so as to add to the beauty of the scene. There are only two exhibitors in this class of horticultural structures and conveniences, but they are a host in themselves. Mr. Henry Cesar, of Knutsford, Cheshire, and of King's Cross Railway Station, London, and Mr. J. S. Inman, Strethford, Manchester, are the two gentlemen who have come forward each with excellent samples of their taste and handiwork in the art for which both are famous. H. S.

PLANTS AND THEIR CULTURE.

MISCELLANEOUS PLANTS.—Many of the plants that were forced for winter decoration will by this date be sufficiently hardened off to place in their summer quarters. The Azaleas of the mollis section will have made a nice growth in a cool house or a late vinery; and may be plunged in the open border of light loamy or peaty soil, and well supplied with water. If a year's rest can be given them, and the plants turned out of their pots, the drainage being then removed, they will make better plants for forcing the next year. The plants of *Deutzia gracilis* will have made a good growth if they have been afforded similar treatment to the Azaleas above mentioned, and may be plunged like them. The later plants of *Deutzia* should get frame protection till the new growth is advanced, syringing them two or

three times daily in bright weather to promote growth, the plants being plunged in coal ashes at the end of the month. Every evening, in fine weather, *Dianthus* in the open should get a heavy syringing. Callas that may be wanted at Christmas-tide should be turned out of their pots, the old soil shaken away, the suckers removed, and the plants repotted in the same sized pot, employing sound loam, $\frac{1}{2}$ -inch bones or bone dust in this potting, and plunging the plants on a warm border and liberally supplying them with liquid manure as soon as the new leaves get somewhat advanced. I prefer single plants in 6-inch pots for early spathe, the remaining or larger portion being shaken out, divided and planted out in a rich compost—cow dung preferably. A south or warm border is not necessary for these later plants. It is well to leave ridges between the rows of plants, or make basins round each to hold water.

Spiraeas may be divided and planted in a moist border, and have abundance of water afforded them. *Spiraeas* soon make large clumps under these conditions. *Viburnum opulus*, if planted out-of-doors after having made a little new growth, will be of use another season; and when become too large for pots may be planted in the shrubberies. Prunus and other similar plants should be treated in the same way as *Viburnum*, it not being desirable to leave these plants exposed to hot sunshine without root-protection. *Bouvardias* will now be fit to be turned out of their pots, and planted if possible on a disused hot-bed; on such, the plants make a much finer growth than when planted on a border. If *Bouvardias* are damped over every evening, stopping a few of the strongest shoots, and not inducing coarse growth, watering occasionally only, with liquid manure, good plants will be secured. I prefer the young plants of last year for planting out, cutting the shoots hard back in early May. Young stock struck this year will require a close frame, and to be kept rapidly growing and free from aphid. This lot of plants will form a succession to those which are planted out.

Solanums are much better for being planted out-of-doors in summer; the only attention required by them is, to keep them clean, and water them well in dry weather. Cut-back *Solanum* should get a place on a south border; the young plants may be treated in the same way when large enough, and the points of the shoots stopped occasionally. The plants are better for being syringed in the evening of dry days, when the bloom is set. *Pernettyas* need a somewhat similar place, and to be well supplied with water, planting them in loamy soil containing peat and leaf-mould. When the plants are in bloom, no water need be afforded them overhead until the berries are set. *Salvias* for blooming in the autumn may now be plunged out-of-doors, after having been hardened off; also all species of *Eupatorium*. *Eupatoriums* must not be allowed to get very much pot-bound, or the foliage will drop and the bloom be poor. *G. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

THE COOL-HOUSE.—Some difficulty may now be experienced in keeping down aphid on the young growths, flowers, and flower-spikes of *Odontoglossums*; this will be much mitigated if a sharp eye be kept upon the plants, syringing them each morning, after killing such aphides as are noticed with saliva and the brush. This may appear a tedious operation, but it is not so, as many plants may be examined in the course of an hour.

The temperature of the house must be kept as low as possible, and syringing should be done often, not necessarily in a heavy manner, or over the plants every time. On very warm days I find it good practice to reduce the air usually given at the top, coming in, as it does, in a dry state; more air being put on again towards evening. *Oncidium Marshallianum*, as it goes out of flower, should be kept on the dry side till the roots and growths push. It is really a cool-house plant, though often grown in warm houses; but I never knew of an old-established healthy plant which had been grown warm. Imported plants do well the first year in an intermediate-house.

Disa grandiflora, now sending up flower-spikes, must be carefully watched, thrips and aphid soon damaging the flower-buds, and discolouring the young leaves on the flower-scape; a small quantity of soot or guano-water may be employed about once a week, and the plants should be syringed heavily

every day. *Ocidium macranthum*, *Odontoglossum Edwardii*, and *O. ramosissimum*, should be kept at the coolest part of the house. *Masdevallias*, as they go out of flower, should have all the old spikes removed low down, for they look very unsightly when left long. *Odontoglossum chiriquense*, now in flower, is a magnificent Orchid, which should be found in all choice collections. No fire-heat will, in all probability, be necessary before the month of October.

Intermediate-house.—The *Plonies* here must have every attention as to watering, the young growth now being in process of forming their corms. Liquid cow-manure and guano may now be applied with safety, but each should be commenced with a little at a time, and by so doing, all danger from their use will be avoided. If ants are troublesome, as they sometimes will be, gallipots should be stood about in their runs, with a decoction of thick syrup and water. *Laelia prestans* and its varieties, now breaking forth into growth, must not be allowed to become dry, but should be well syringed every morning, and the same treatment should be meted out to *Sophranitis grandiflora*, *Odontoglossum citrosium*, as it comes out of flower, should be repotted if requiring it, employing a compost of three-parts fibrous peat and one of sphagnum moss. *Vanda tricolor* and *V. suavis*, after flowering, should have their leaves and stems washed with soft-soapy water to remove the dirt. The atmosphere of this house should be kept very moist, with a minimum temperature at night of 62°. *A. G. Catt, Parsfield, Worcester.*

FRUITS UNDER GLASS.

VISITERS.—If the preparation of Vines and soils was made as advised, the replanting of exhausted vineries may be pushed forward. If the crop is ripe, the Grapes will keep fresh in a cool room for several weeks, if cut with shoots having leaves attached. If the Vines are intended for early forcing, I prefer to have all the roots inside, and so avoid the fluctuating temperature outside. Some growers form an inner $\frac{1}{2}$ -inch wall at a brick distant from the outer wall, and thus prevent the roots being affected by cold. There is no Grape yet known superior to the Black Hamburgh as a first early, but *Madresfield Court* does well in conjunction with it, and requires only a week or ten days longer to finish; but the pollen of the former is sometimes required, if weather should be bad at very early setting time. Before planting, the soil should be made very firm, and the young Vines carefully slid off their rafters, or if in pots, their roots uncoiled and partly shaken out, a watering with a fine rose pot being given to settle the soil about the roots. Fasten the plants somewhat loosely for a time, uncoil the roots with spent manure, and maintain a moist atmosphere, shading the Vines slightly for a few days if the weather be sunny; remove all tendrils, and encourage lateral growth, as by so doing root-action is promoted. In border-making, where the subsoil is clay, marl, or of some other non-porous material, it is necessary to concrete the bottom.

It should be stated that concrete, or slabs of stone, are cold and very damp, when placed on the bare clay; and this being so, it is prudent to place a layer 2 inches thick of clean rubble above the clay, marl, &c., and put in pipe-drains, which should run right through, and be provided with openings at either end, for aeration purposes. A small quantity of drainage materials will be required in addition to this. Such precautions are important factors in the early ripening of the wood, without which very early Grapes often prove unsatisfactory. Make the borders piecemeal longitudinally—say, 3 feet at a time—and leave a turf wall at the outside wherever practicable.

Vinerias, where the Grapes are ripe, must be kept as cool as possible, and be mulched with clean straw, to prevent evaporation from the border. Encourage growth of foliage on any black Grape-vines, where the fruit is about to colour, giving plenty of air, and do not hurry the Vines; but white Grapes should have their foliage partially tied on one side, away from the bunches, admitting sunlight, to bring them up to their proper colour. *Madresfield, Morocco, Foster's Seedling*, or other kinds subject to cracking of the berries, must be carefully tended, and former directions carried out. Finish as expeditiously as possible the thinning of Black Alicante, Lady Downe, Gros Colmar, and other late Grapes, which require thinning. Tie up the shoulders of large

bunches as soon as their weight has straightened the main-stalk. Give Vine borders abundance of water, but first mulching with a thick layer of rotten manure, letting it be of such a nature that it will not make the surface pasty. Spent mulching should be removed, and renewed with fresh; but it should be noted that the ammonia arising therefrom is apt to spoil the foliage, if the ventilation be neglected in the early hours. A safe plan is to leave a small amount of top air at all times during the night. Keep a look-out for red-spider, and immediately sponge with soapy water the affected leaves, and these are easily detected by their yellow look. The sponging should be followed by a few good syringings now and then at closing time, and before the colouring season sets in, using a little fire-heat to dry the foliage.

Give every encouragement to late Grapes, so as to have them ripe in September, as only those coloured at that time will keep satisfactorily either bottled or left on the Vines. Lady Downe, well ripened in a good brisk Muscat-house temperature, will keep plump and fresh till the following May. Continue to use fire-heat at nights and on dull days in Muscat-houses, and do not neglect the night ventilation, or the brown spot at the apex of the berries will appear. If all the laterals cease to grow, it is an indication of overcropping, and must be remedied. Let the growth of laterals extend wherever space can be found for them without overcropping. Train up young rods at intervals, as this gives new life to the Vine, annually spurring in, with no extension whatever, soon causing signs of distress to appear; in fact, kinds like *Barbarossa* soon refuse to fruit if there be no extension. Keep late Hamburghs cool, short of draughts, and endeavour to keep all the old foliage healthy on Vines whose crops are gathered. Stop the stems of pot Vines at 7 or 8 feet high, and afford them plenty of air and heat to mature. Pot on late pot Vines. *W. Cramp, Madresfield Court, Malvern.*

THE KITCHEN GARDEN.

ASPARAGUS BEDS.—Those beds which are in full bearing should be cut over each alternate day, and if the beds show signs of being distressed, cutting must not be followed up late in the season. About the middle of this month is the time to cease to cut—a time when Peas, Cauliflowers, and other summer vegetables are in abundance. In cold districts cutting may be done to a later date. Keep the beds free from weeds, and afford some kind of manure to the plants after cutting is over. Newly-planted Asparagus beds should be hoed between the rows of plants, and on light soil plenty of manure may be placed on them, this rendering the soil moist, and strengthening growth. Seedlings on permanent beds may be thinned out to 8 inches apart, transplanting each alternate plant next season, so that at last the plants will stand at 16 inches from stool to stool.

Globe Artichokes showing heads should be literally afforded strong manure-water, and heavy mulching. Those March or April-planted should not suffer for want of water at the root, or of mulching. For the latter, cow-house manure is best, if the soil be dry.

Tomatoes.—These plants will now have a height of 18 inches or 2 feet, and may be hardened off, in readiness to be put out-of-doors. In planting Tomatoes, there is no real need for giving much manure about the roots, luxuriant growth always following its employment, and little or no fruit. Heavy soils should be deeply dug, and leaf-mould or spent Mushroom-bed dung mixed with it. Thoroughly water the plants whilst in the pots, and, after becoming somewhat drained, remove the crocks, but do not break the ball nor disturb the roots much, planting them out at suitable distances, making the soil firm about the roots. In the cold parts of the country, better results may be obtained by potting the plants into 12 to 14-inch pots, which should be plunged to the rim at the base of a south wall or fence. The main point to be observed is the pinching out of the side laterals, so as to avoid the crowding the main stem on which is the fruit.

Turnips.—Make small and frequent sowings of Snowball, Veitch's Red Globe, and choose whenever possible, cool aspects and a rich soil for the beds. Thin early, and dust the plants with soot, lime, &c., to keep the fly at bay; a better remedy perhaps than either is the constant disturbing of the soil with the hoe, and frequent applications of roadside dust. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on one side only of the paper, and sent as early in the week as possible.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

WEDNESDAY, JUNE 11 { Royal Botanic Society: Second Summer Exhibition.

MEETINGS.

TUESDAY, JUNE 10 { Royal Horticultural Society: Fruit, Floral, and Scientific Committees and Lectures, at Westminster.

THURSDAY, JUNE 12 { Gardeners' Royal Benevolent Institution: Anniversary Dinner, at "The Albion," Aldersgate Street.

SALES.

THURSDAY, JUNE 12 { Orchids in Flower and Bud, also Imported, at Stevens' Rooms.

FRIDAY, JUNE 13 { Orchids, Established and Imported, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°.2.

AN interesting ceremonial was enacted on Saturday last at Kew, on the occasion of the resignation of Professor OLIVER as Keeper of the Herbarium. Mr. J. R. JACKSON, as the oldest member of the staff, read the following address to the Professor, in the presence of all the members of the Herbarium and Museum staff, with representatives of that of the garden, and one or two outsiders, who, from their almost constant presence as workers in the Herbarium, were specially permitted to take part in the proceedings. Others, whose visits are less frequent, heartily concur in this expression of regard for the Professor, and in admiration at the way in which he has administered the Herbarium for so many years.

Prof. OLIVER has, by his sterling qualities and great botanical acquirements, so endeared himself to his associates that the simple ceremony was very touching, and it was felt to be so, not only by the memorialists, but also by the Professor, who made an appropriate reply. The memorial was, fittingly enough, read in the large room occupied by the late Mr. BENTHAM:—

"DEAR PROFESSOR OLIVER,—Your resignation of the post of Keeper of the Herbarium and Library of the Royal Gardens, Kew, which you have held for the past thirty years, was felt to your colleagues and habitual workers in the Herbarium at the moment, whose names are hereto subscribed, an opportunity of expressing the great regard they have always entertained for you, and the regret they all feel at

losing some of that kind assistance which you have so readily and uniformly rendered to them when seeking information from, or working in, the great and important department of the establishment over which you have so long presided with so much distinction to yourself and advantage to botanical science generally.

"The regret that we all feel at your withdrawal from active work amongst us is, to some extent, lessened by the prospect of your periodical attendance at the Herbarium, and of your continued residence near the scene of your life's labours.

"While we shall always preserve very pleasant memories of our past relationship, we beg to offer you our sincere wishes for the future health, happiness, and long life of yourself and family in the rest you are now seeking.—Believe us, dear Professor OLIVER, yours sincerely—

(Signed)

May 31, 1890.

MR. WILLIAM RICHARDS.—We are glad to say that our Publisher has returned from New Zealand considerably improved in health, and will resume his duties early next week.

KING JOHN'S OAK.—With reference to the antiquity of this tree (fig. 119), we may quote from the *Guide to Kew*, in which it is stated that "two and a half centuries ago it was then known as the Old Oak."

It stands a little within the wood on the right of the footpath leading from Kew Park to Sevenoaks, and only a few yards distant from the famous King Beech.

Everyone who is privileged to see this curiously contorted and venerable tree, is struck with the immense size of the bole and its irregular proportions as compared with the total height; while only a glance is needed to point out that it is one of the few remaining trees of the great forests with which this part of England in remote ages was covered. There is good reason for supposing that this same old Oak gave shelter to barons and knights of the era of the elder Plantagenets on their excursions across the extensive forest or waste of which Kew Park of to-day must have formed a part.

In any case the tree was of noble proportions, and although many of the larger limbs have fallen from old age, or the effects of the storms, yet sufficient still remains to make it an object of interest and veneration.

The bole is hollow, and was formerly used as a place of resort by travellers and others, but now the entrance is boarded up, and a stout iron fence guards the tree from intruders; while, to prevent the larger limbs from falling apart, props have been placed around and in such a manner as to lessen the chances of further injury from wind.

There are several names attached to this tree, as the Wiche's Oak, the Old Oak, and that which forms the heading of this note. That it is a tree of unusual proportions, and of great antiquity, is well set forth in the accompanying cut. *A. D. Webster.*

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Caledonian Hotel, Adelphi, on the 30th ult., Mr. JOHN LAING presiding. It was resolved that a further sum of £500 be invested in Government Stock. A report from the Trustees of the Wildsmith Memorial was read, from which it appeared that the sum of £140 18s. had been subscribed, and

after deducting the expenses, £138 14s. 9d. had been paid over to the Fund; and WALTER HYDE, aged 3 years (nominated by Mr. T. TURTON and Mr. J. S. JONES, on behalf of the Trustees) was placed on the Fund. The following donations were announced:—Earl CAWDORE, £5; Mr. F. SANDER, £6 10s.; Mr. R. H. ROBINSON (proceeds of a concert at MIlnthorpe, £14 5s. 7d.); and proceeds of a box at the Temple Show, £3 11s. The Annual Dinner will take place on July 18, when Mr. SHIRLEY HINBERG has kindly consented to preside.

FRUIT FARMING.—Mr. CECIL HOOKER, of the Swanley Horticultural College, has reprinted from the *Transactions of the Highland and Agricultural Society of Scotland*, a lecture he delivered to the class of agriculture in the University of Edinburgh. He admits that the production of fruit yields better prices than that of corn, meal, or milk, for the present, and says that Scotland can supply the south with late fruits, which command more remunerative returns than when the markets are crowded with fruit. At the same time, he says that fruit-farming needs a larger capital than ordinary agriculture. The cost of preparation and cultivation till there is a remunerative return varies according to circumstances from £35 per acre upwards, the working capital to stock a fruit farm already planted is £20 per acre and upwards. The paper is decidedly one of the best and most thoroughly practical of the many that have appeared on the subject.

Sir E. BIRKBECK gave an address at Great Yarmouth lately on the subject of fruit culture, in which he detailed the *pros* and *cons*, with which our readers are now mostly familiar.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The dinner subscription list progresses favourably, and Mr. H. J. VETCH will, we think, be able to announce a handsome addition to the funds when he takes the chair on Thursday next. Mr. J. WILLS has received from Sir D. PROBYN a letter to the effect that H.R.H. the Prince of WALES will subscribe £10 10s. to his list.

THE LATE REV. M. J. BERKELEY.—The QUEEN has been pleased to approve of the grant of Civil List pensions to Miss CHARLOTTE, Miss RUTH, Miss MARGARET, and Miss ROSE BERKELEY, daughters of the late Rev. M. J. BERKELEY. All botanists, and especially all the readers of the *Gardeners' Chronicle* from 1843 till two or three years since, will know how thoroughly appropriate this grant is. A Civil List pension has also been granted to Mrs. WOOD, the widow of the late Rev. J. G. WOOD, who did so much to popularise natural history.

PHILODENDRON CANNÆFOLIUM.—A Brazilian species, remarkable for its fleshy, inflated petiole, broad midrib and spathes, coloured whitish outside, and green inside, has long been known in botanic gardens, but has not hitherto attracted the attention of horticulturalists. A small plant of it was, however, offered for sale at Messrs. PROTHEROE & MORRIS' Auction Rooms on Tuesday last, and realised the astonishing sum of 9 guineas. It is satisfactory to learn that the plant was the property of the widow of a sailor who had brought it from Brazil as a curiosity several years ago. Plants of this species are in the Kew collection.

THE ROYAL HORTICULTURAL SOCIETY.—Herbaceous Peonies are to be the feature of the meeting at the Drill Hall next Tuesday. Mr. G. PAUL and Mr. R. J. LYNCH are announced to read papers on the subject, and the Society offers a Silver Challenge Cup for the best collection of herbaceous Peonies from an amateur, and this ought to bring forth a good display.

ORCHIDS.—The following, which we cull from the *Weekly Gazette*, Montreal, betrays such ignorance of horticultural matters, that it is as amusing to read as any passage in a comic paper:—

"The greatest known amateur of Orchids in

England is the Duke of Marlborough. He has sold his paintings, tapestries, and race horses, but has kept his conservatories. His collection of Orchids at Blenheim is worth £30,000—a sum exceeding, according to experts, the value of the finest French collection at Ferrières. Wonderful are the Orchid

incomprehensible value, and will only guide them to the spots where they grow when paid exorbitant prices.

"When the plant has been removed from its abode, either from trees or rocks, it is packed in a box lined with cotton-wool, and sent to Europe. On its

often lasts only a fortnight—the plant has to be classified. The only thoroughly scientific authority respecting orchidaceous plants is Professor Reichenbach (the late Professor Reichenbach), a German, of Hamburg, where he resides permanently, and to him photographs are continually forwarded, with details of shades and peculiarities. Sometimes, however, these are insufficient for classification of the plant, and it becomes necessary to send it for personal inspection to the Professor. The Duke of Marlborough employs special couriers, who carry the plant, suitably packed, from Blenheim to Hamburg, where it is classified. It is only a passionate amateur who would bear such a trouble philosophically, but the Duke is satisfied with being the possessor of a hitherto unknown Orchid. The number of species of Orchids is greater than that of any other of the monocotyledonous order—not even excepting grasses—amounting to between 4000 and 5000 at least. The Orchid *Kykusta Shenner* (? *Lycaste Skinneri*), a native of Guatemala, is the largest known. Its colour is pink, but it is of no great value—140 dols. to 150 dols. a plant and 15 dols. a flower. (1) The white Orchid is the most valuable, bringing 240 dols. per flower. (2) The prices paid for new or rare varieties recall the days of the Tulip mania. Can the history of any plant be more preposterous than that of the Orchid *Pendrobria Nobita* (*Dendrobium nobile*?), sold to the Duke for 38. 6/7, and valued now at more than 3000 dols.? (3) For amateurs the fascination which enchants them in the Orchids would seem to be the artificiality—unnaturalness, one might almost say—of the plant's anti-physical peculiarities.

"Paris must also be credited with love of flowers. In order to produce Roses on 13,000 trees for that one week, scientific marvels are performed, which are not taken into account by the gentleman who finds it hard to spend 10 dols. for two small branches of Lilacs, nor by the lady who feels rather aggrieved at receiving so many flowers."

THE BORDEAUX MIXTURE.—So important, says the *Canadian Horticulturist*, has this copper solution become to fruit growers, that it is important to have the formula for its preparation of convenient access. A late Bulletin of Cornell University gives a modified formula, which is cheaper than the original one, more readily applied, and less injurious to the young foliage. We, therefore, give our readers this new formula, hoping that our orchardists, who are troubled with the scab on Apples and Pears, will give it a thorough trial, and report to us the result:—(1), Sulphate of copper, 6 lb., dissolved in 1 gal. of hot water; (2), lime, 4 lb., dissolved in 1 gal. of cold water. Mix the two solutions as above, and, when desired for use, dilute to 22 gals. with cold water.

BURY AND WEST SUFFOLK HORTICULTURAL SOCIETY.—Through the kindness of Earl CADOGAN, the summer show of this very old society is this year to be held in the beautiful park of Culford on July 3 next, and an excellent show appears to be confidently expected. Culford is just 4 miles from Bury by road, and from the Ingham station of the Bury and Thetford Railway it is a pleasant walk of very little more than a mile.

REICHENBACHIA.—The second volume of this magnificent publication is dedicated by special permission to H. M. AUGUSTA VICTORIA, Empress of Germany, and Queen of Prussia.

BOTANICAL COLLECTORS.—The perusal of the short historical sketch of the Royal Horticultural Society, prepared by Mr. WILKS on the occasion of the Temple Show, reminds us once more of the singularly ungrateful way in which horticulturists have ignored some of their greatest benefactors—KEEVE, DOB, FORBES, POTT, HAIRWEIG, WEIR—were all in the Society's service, and of the importance of their service to horticulture, especially in the case of DOUGLAS and FORTUNE, it is impossible to speak too highly, yet there is not a portrait of either in the Society's rooms; not a medal, nor a scholarship, nor

FIG. 119.—KING JOHN'S OAK, KNOLE, HERT. (SEE P. 712.)

houses at Blenheim. There are three, each 330 yards square, always kept humid by means of steam, a condition essential to tropical Orchids; dry heat is death to them. The Duke of Marlborough has Orchid-hunters in almost every country where they are indig-nous—Mexico, India, and Ceylon especially. The natives, who at first ridiculed the foreign Orchid-hunters, have now learned the secret of their

arrival, the Duke is unaware of its value, as three months must elapse before the plant will flower. The uncertainty as to the flower about to blossom is a source of great excitement to the Orchid amateur—quite as great a madness as the Tulip folly. During the short space of time the plant remains in bloom—the rarer the species, the shorter is the duration of blooming, which never exceeds six weeks, and very

anything to commemorate their services, save a casual mention in books or newspapers. WILLIAM LOBE, who introduced the Wellingtonia; JOHN FRASER, and many others, might be mentioned among those not connected with the Society. The passion for Orchid growing has in later times called forth a small army of collectors less well known to fame, because chiefly instigated by purely commercial considerations, and confining their attention to a few specialties; but they, too, have deserved well of horticulture, and, unhappily, a large proportion of them have lost their lives in the service. At Prague they are about to erect a monument to ROEZL. When shall we commemorate DOUGLAS or FORTUNE?

MONUMENT TO ROEZL.—We have received the first list of subscribers to this memorial. Among the names are those of Mr. SANDER, £5; Messrs. DE SMET, £2 10s.; Mr. GODEFROY, £1. From Russia 73 roubles have been received, and various sums from Mexico, Bohemia, Columbia, and Switzerland. The execution of the model for the monument has been entrusted to Professor MYSLEBK, a well-known sculptor of Prague. Further subscriptions are requested, and may be forwarded to Mr. THOMAYER, of Prague, or to the Editor of this Journal.

DUTCH HORTICULTURAL SOCIETY.—At the meeting, May 14, 1890, of the above Society, the Floral Committee awarded the following First-class Certificates:—To Mr. W. J. VAN LANSBERGE, at Brummen, for *Odontoglossum vexillarium*, *Odontoglossum Cervantesii* lilacina, and *Cattleya Schroderiana*; and to Messrs. E. H. KRELAEG & SON, at Haarlem, for a collection of *Tulipa Billietiana*, of Jordan.

BEEES AND BEE-KEEPING.—Mr. UPCOTT GILL is publishing a re-issue of Mr. CHESHIRE'S classical book on this subject. The second volume, which deals with practical matters, is now published as most appropriate to the present season, while the anatomical details and physiological descriptions will be given later on. The book is published in parts, and should be in the hands of all bee-keepers.

NOVA SCOTIA APPLES.—In the report of the Secretary for Agriculture (Dr. LAWSON), we find the following passage: "We believe (the Secretary of the King's County Agricultural Society is speaking officially), that for years to come a man will be as sure of a profitable return from trees planted in this valley as he can be of anything upon earth. That our farmers have this faith in it is proved by the new orchards and additions to old ones that are being planted every year. The price obtained in the London market for good well-packed Apples is from 1/0s. to 2/0s. per barrel. The best commercial sorts are Gravenstein, Ribston, King, Blenheim, Golden Russet, Fallowater, and Nonpareil; Northern Spy has gained in favour, Baldwins and Bishop Pippins have fallen off. Many people in Nova Scotia have dugged for hidden treasure and found none, but hidden beneath the roots of our Apple trees is a mine of wealth which patient digging shall surely find, and keen observation and scientific methods as surely transform into golden fruit and sterling cheques."

RED RUST.—It is estimated that a million of money has been lost this season in South Australia from the ravages of red rust. Sulphate of iron is stated to be useful as a remedy. Sulphate of copper would be better, but it is obvious that their application on a sufficiently large scale is not feasible.

ORCHIDS, THEIR CULTURE AND MANAGEMENT.—This work, which has been produced in monthly parts, is now completed. It is compiled by Mr. WATSON, of the Royal Gardens, Kew, assisted by Mr. BEAN. The aim is to give a descriptive catalogue of all the garden Orchids worth growing, and to give full directions for the cultivation of each. The arrangement is alphabetical, and the substance of an earlier publication by Messrs. BRITTON and GOWER has been incorporated in the present volume,

with many modifications and additions. The last chapters are devoted to the consideration of hardy Orchids. We recommend the book to the notice of all young gardeners and beginners in Orchid culture.

HINTS ON CACTI.—It is said that these singular and often gorgeous plants are coming into favour again. If it be so, amateurs will be glad to know of a catalogue, published by A. BLANC & Co., Philadelphia, in which directions for their culture in rooms, greenhouses, and gardens are given. Descriptions of the most important species, together with numerous illustrations, are given.

WELBECK.—In an article in *Garden and Forest*, on this estate, in which the eccentricity of the late Duke and the absurd manner in which his wealth was expended are alluded to, the writer says:—"No American can see Welbeck and all its ghastly splendours without finding cause for congratulation, for the laws and customs of his native land which make such establishments impossible here." Is this the reason why an American is reported to have attempted a feat in Scotland from which he would probably be debarred in the States?

AUSTRALIAN PLANTS.—Baron Sir FERDINAND VON MUELLER has issued a second systematic census of the plants of Australia, comprising their names, references to books where they are described, date of publication, local and general distribution. It is a great boon to have so complete a list for reference.

GARDENING IN INDIA.—Mr. MARSHALL WOODROW has published a fifth edition, much enlarged, of his *Hints on Gardening in India*, illustrated with numerous woodcuts. In addition to the usual details as to soil and ordinary garden operations, Mr. WOODROW gives a series of meteorological tables, showing the average climatal conditions for numerous stations and altitudes in India, which will be very useful to cultivators at home, as well as in India and the colonies. Directions for laying out gardens, and the treatment of plants after a long journey, and other details are given. It is natural that Anglo-Indians and colonists should endeavour to cultivate the plants they have been accustomed to see at home; but it is greatly to be desired that they should take in hand the native plants of the country they happen to be in, and cultivate them. They would find this often less difficult, and would have the satisfaction of annexing new subjects for the kingdom of horticulture. How much more valuable at Indian flower shows would it be to encourage the development and improvement of native produce than to attempt to cultivate exotics more or less ill suited to the climate. At any rate, there is no reason why the culture of exotics and the development and improvement of native plants should not be carried on simultaneously. Mr. WOODROW, in his remarks on the Mango, shows that he is alive to the importance of the subject.

"PLANT ORGANISATION."—Under this title, Dr. R. HALSTED WARD has published through Messrs. GINN & Co., of Boston, U.S.A. (E. ARNOLD, 18, Warwick Square), a series of tables resembling the schedules introduced by the late Professor HENSLAW, and so familiar in the pages of OLIVER'S elementary lessons. These are so constructed as to comprise the leading points of structure, blanks being left for the student to fill in from the plant presented to him, or in the case of beginners, from large diagrams. Other spaces are left for outline sketches, which are more valuable than written descriptions. The spaces allotted are rather small, and the abbreviations puzzling; but for use with a teacher in class the plan is excellent, as the student becomes familiarised in a very short time with the most important points of structure and arrangement. A glossary of terms, with illustrations, forms a useful addition.

WALLFLOWERS.—Recently we received from F. ROMEN, Seed Grower, Quedlinburg, a quantity of

large spikes of double Wallflowers of various colours, brown-yellow, purplish-brown, orange, and yellowish-white. The plants had been grown in pots, and presented an appearance very dissimilar to a Wallflower from the open ground, being very tall but robust, and wanting in lateral shoots. Mr. ROMEN tells us that he grows 6000 pots of double Wallflowers, and these for seed purposes only. The seeds of Wallflower should be sown by the middle or end of May in a cold frame, or in prepared sandy soil in the open ground. Choose moderately rich soil, such as the Ten-week Stock delights in. Prick off the young plants as soon as large enough to handle, and transplant them by the end of June into beds in the open ground, at a distance of 1 foot apart. Stir up the ground during summer several times. Plant them in pots by the beginning of October. For this purpose, choose a good loamy soil; give the plants a good watering, and place them in a cold frame, which should not be covered with lights, but only with boards, giving air as freely as possible without taking off the boards, except in rainy weather. When cold weather ensues, care must be taken that the Wallflower plants are wintered as coolly as possible, affording as much air as possible, but keeping out hard frost; a little frost does no harm. By the end of March, place them in a half-shade place, where they can be sheltered, and where rain will not harm them, and early in April the plants will begin to bloom.

JAPAN.—The export of plants, trees, and shrubs for the month of January, amounted to 5708 *yen*, according to the *Journal of the Japanese Horticultural Society*. One *yen* is equal to about 3s. 6d.

YELLOW-BERRIED IVY.—Among the curiosities at the Temple Show, was a spray of the yellow-berried Ivy, sent from Worthing by that veteran horticulturist and friend of the Society, Mr. JAMES BATEMAN.

PRESENTATION TO MR. J. S. JOHNSON.—This gentleman, who has been connected with the well-known firm of Messrs. HURST & SON for the long period of thirty-seven years, and who is retiring solely on account of impaired health, had a very gratifying presentation made to him by the *employés* of the firm on the occasion of his taking farewell of them on May 24 at 152, Houndsditch, E.C. The presentation was made by Mr. HUGH AYTON, and the gift consisted of a centre-piece and a pair of candlesticks, the former bearing the following inscription:—"Presented to Mr. J. S. JOHNSON by the Staff of Messrs. HURST & SON, on his retirement, after thirty-seven years' connection with the firm, as a token of their regard and esteem." Mr. JOHNSON replied in appropriate terms.

LONDON PURPLE.—Some time since, when commenting on the large use made of this substance in America as an insecticide, we mentioned that though called London Purple, it was not known in this country, and not procurable. Both these statements are now no longer correct, and Messrs. BEALE & Co., of New Southgate, now inform us that they can supply it in small quantities, with directions for use.

SUMMER SHADING AND THE PERFECT WEED KILLER.—During the month of April last, a sample of what the sellers—the Horticultural and Agricultural Chemical Company, 103, Holm Street, Glasgow—called *Summer Shading*, was sent to this office for trial, and which we sent to Mr. A. EVANS, the clever gardener at Lythe Hill, Haslemere. His report of a trial which he made of the substance will be found below. The *Perfect Weed Killer* was another article vended by the same firm, also sent to Mr. EVANS, whose opinion of it we append:—

"The summer shading I put to a good test on the roof and gable of a glasshouse, and I am enabled to endorse all that the manufacturers claim in its favour. I had the hose applied direct on to the gable end for five minutes, and actually on one

NOTICES OF BOOKS.

square of the glass, but at the end of that time there was scarcely any difference to be observed between the shading on that and the other squares, although there was a 90 feet fall from the water tanks, and the pressure great in consequence. This was again done the day afterwards with the same result, and yet it comes off by the lightest rub, a point which is, I think, of great value. There are many kinds of shading used which answer every purpose as a shading, but when not longer required, their removal offers great difficulty, and often entailing a good deal of labour and some breakage of glass.

"The Perfect Weed-killer" I have tried with very good results, as far as I can judge at the present. Some weed-killers only disable weeds for a time, and others destroy them. I applied it at the rate of 1 gallon to 50 square yards of gravel, and it took effect in a marked degree in three days afterwards. Weed-killers should be used annually in summer on every drive, walk, courtyard, and similar area which is near to grassland—it keeps them free from grasses and weeds; another dressing given in September will kill the summer seedlings, and make the surface smooth, compact, and clean for the season.

BIOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS.—From the list of those published in the *Journal of Botany* for May, we extract the following:—

"PERRIN, JAMES (c. 1655-1718): b. Hillmorton, Warwickshire, circ. 1658; d. London, April 29, 1715. Apothecary to the Charterhouse. F.R.S., 1695. Contributed list of Middlesex pl. to G. Bon. 'Camden,' and to Ray's 'Historia,' vols. ii. and iii., and 'Synopsis,' ed. 2. and to Phil. Trans. 1697-1717. 'Opera,' 1761. Plants in Herb. Sloane. Sloane MSS. 3320-3328. Pult. ii. 31; Pritz. 215; Jagers. 501; Fl. Midd. 379. *Peltivora* Plummer.

"PETER, ROBERT JAMES, SIR BAYON (1713-1743): b. June 3, 1713; d. July 2, 1743. F.R.S., 1741. 'The Phoenix of this age,' Collinson. Had garden with large stoves, under Philip Miller's supervision, at Thorndon, Essex. Introduced *Candelia japonica*. Rich. Corr. 316, 319, 392; Linn. Letters, i. 9; MS. on fly-leaf of B.M. copy of Pult. ii. *Petrula* L.

"PIESSE, GEORGE W. SEPIMUS (1820-1882): b. May 30, 1820; d. Chiswick, Oct. 23, 1882. 'Art of Perfumery,' 1856. Pritz. 247; Jagers. 210.

"PITCHER, WILLIAM (1714-1791): b. Dysart, Fife, 1711; d. Islington, Nov. 25, 1791; bur. St. Bartholomew-the-Less, M.D., Rhovins, M.D., Oxon, 1749. F.R.C.P., 1759. F.R.S., F.R.C.P., 1775. Had a bot. garden in Upper Street, Islington. Munk. ii. 472. Portr. by Reynolds. Mezzotint by J. Jones, 1777. *Pitcairnia* L. Herb.

"PITTS, EDMUND (d. 1678). Alderman of Worcester. 'A very knowing botanist.' Discovered *Pyrus domestica* in Wyre Forest. Phil. Trans. xiii. 1678, 978; Lee's Bot. Worcester. lxxxviii.

"PLANCHON, JULES EMILE (1823-1888): b. Ganges, France, March 21, 1823; d. Montpellier, April 1, 1888. F.L.S., 1855. Assistant in Sir W. Hooker's Herb., 1841-18. Prof. Bot., Ghent, 1849; Montpellier, 1851-88. Co-ed. 'Flora des Serres,' 1849-81; Pritz. 248; Jagers. 592; R. S. C. iv. 362; viii. 681. Ann. Bot. ii. 423 (1888), with bibliography. *Planchonia*, Don.

"PLANT, R. W. (d. 1841-1852). Of Cheddle. 'New Gardener's Dictionary' (n. d.), 1849. 'Experimental cultivator and nurseryman.' Bot. Reg. 1844, p. 89. Collected in S. Africa, 1850-52. 'Excursion in Zulu Country.' Journ. Bot. 1852, 222, 257. R. S. C. iv. 363. Plants at Kew. *Plantia* Herb.

"PLATT, SIR HUGH (d. 1571-1606): bur. Horsey? B.A., Camb., 1571-2. Of Coft Hall, Essex, and Kirby Castle and Bishop's Hall, Middlesex. Knighted, 1605. Had a garden in St. Martin's Lane, 1606. 'Garden of Eden' (posth.), 1653-60. 'Flora's Paradise,' 1608. Johnson, 69; Pritz. 248; Wood, Athen. Oxon., ed. Bliss, 622; Cooper, Athen. Cantab. ii. 435, with bibliog.

PUBLICATIONS RECEIVED.—*Picturesque Wales (Cambrian Railways)*. Edited by G. TURNER (London: SIMONS, MARSHALL & Co.)—*Notes on the Pandy*. By CHARLES KAY. (Stirling: C. HARVEY, Baker Street).

ANNALS OF BIRD LIFE. A Year-Book of British Ornithology. By Charles Dixon. Published by Chapman & Hall.

Mr. Charles Dixon is an author whose name should be well known to ornithologists, as he has written several books relating to this science. His latest work is entitled *Annals of Bird Life*, and this, while it contains statistics and scientific details, is so pleasantly written, that a lover of birds could not do better than consult its pages whenever he wishes for information. He will learn when our migratory birds arrive and depart, whence they come and whither they go, he will hear about many of our rarer birds, which perhaps were before this but as names to him, and he will even find a word of excuse offered for the unfortunate house-sparrow, who is sometimes fed and encouraged with mistaken kindness, and at others ruthlessly inveighed against and destroyed as vermin. The book is in four parts, each of which is devoted to the ornithology of one of the four seasons of the year, and finished by a calendar for spring, summer, autumn, and winter respectively. These calendars give the time of the arrival, departure, song, breeding, moulting, and other data of bird-life; while other tables teach the amateur the "points of distinction" of each species, and how to know one from another. As the work is not intended for very learned readers, or as a textbook for advanced scholars, the author spares us scientific names, and leaves him who would learn the manners and customs of any British bird to consult the full English index, and be referred by it to the pages giving the required information. We must not forget to allude to the illustrations, as many people consider no book complete without them; in this case they are not very plentiful, but are exceedingly soft and pretty, adding much to the attractive appearance of a volume of "annals" which, according to the author, has been compiled from "note-books filled during twenty years of field and forest errantry." That long and patient study has been paid to the subject we cannot doubt, and it is pleasant to find that almost on the first page justice is paid to the intelligence of birds. We hear that they "are no longer regarded as mere automatic machines, governed by mysterious impulses, all vaguely classed under the convenient term of 'instinct,' but as creatures endowed with mind, with mental powers very similar to those which control the movements of man himself. At no other period of the year, perhaps, are these various mental powers so well displayed as in the spring-time. For instance, what enormous powers of memory birds call into action in performing their long journey from Africa and other remote regions, to their summer quarters in this country! What passion and jealousy animate them in the pairing season; what a large amount of imitation, reason, and forethought are required in the all-important task of selecting a site for the nest, and then in building the structure itself! . . . Take the subject of migration first. . . Spring is creeping rapidly over the valleys, and clothing every twig and spray with delicate green. Suddenly, as if by magic, the chiffchaff appears. Scores and hundreds of them may be heard chif-chaffing from the Birch and Alder trees, and even from the long Bilberry wires and Heath that in some places half conceal the rocks. No man saw these birds arrive; silently they make their *début* in their summer quarters, journeying to them in the night when all is still, and the road is safe. Whence have these little feathered wanderers come? They are all the way from Northern Africa; from the oases in the Great Desert; from the groves of Morocco and Fez and the country of the lawless Tondreg. They have crossed the Straits of Gibraltar, passed along the coasts of Portugal, Spain, and France, and over the stormy English Channel; then 200 miles further still, nearly the length of England, to the old familiar coppices in this Yorkshire valley. Think of the

magnitude of such a journey—1500 miles of flight for a pair of little wings almost as delicate as gossamer, supporting a body which would go inside a big thimble! Think of the little mind encased in this feathered casket; the recalling to memory of old familiar landmarks on the way; the eye for detail; the knowledge of locality brought into action between the Date Palms of Algerian oases, and the Bilberry wires and Birch trees of Yorkshire. And remember that this identical chiffchaff has come right back again to the spot where it built its nest last year, and is about to make a fresh one not half-a-dozen yards away from the very bush which shielded its previous home! . . . Then remember the chiffchaff is only a unit in the great migrating army of birds; and that there are others which come from more distant regions still—the swallows, for example, which traverse sultry Africa from end to end, and perform a journey of six thousand miles twice every year of their lives."

The truth of these remarks will be at once acknowledged by all who have studied bird life, and those who have read thus far will be led on to the fascinating account of the courtship, pairing, nest-building, and maternal cares of the chiffchaffs.

We cannot close this notice without allowing ourselves one more extract from the interesting pages before us. Speaking of birds in winter—a season we are apt to think wanting in interest—Mr. Dixon says: "Although it is midwinter, the banks of the stream are a chosen haunt of bird life. Where the water boils and foams round the mossy boulders, we are sure to meet with our old friend the dipper. He is happy enough as long as the stream is open, and keen must be the frost that will stay its rapid waters. He dives into the ice-cold stream, in search of his insect food, just as heartily as in the spring and summer, his dense plumage being impervious to the wet and cold. The charming little gray wagtails are gone; the summer snipe is on the lagoons of Africa; but the kingfisher, in his beautiful dress of blue and chestnut, haunts the lower reaches of the stream. He is much less fortunate than the dipper, and often feels the pinch of hunger. No birds are affected so much by a long-continued frost as those that seek their food in slow running waters or amongst marshy ground. The poor kingfishers fare badly at such a time, and numbers of them are starved to death, whilst they have even been found frozen to the twigs on which they have chanced to rest. Sometimes this bird may be seen sitting above the frozen pool, the banks all draped with icicles, and set in a framework of frost and snow, watching the tiny fish and water insects on which it feeds, but quite beyond its reach, owing to the film of ice that has covered the water in a single night. In the Alder trees on the banks of the stream, little parties of siskins are busy picking at the seeds; here and there a wandering heron flies hurriedly away. This bird will not stay by the stream if the frost continues."

Our readers will gain an idea of the style of the book from these excerpts, and will surely welcome as heartily as we do a work which will increase their knowledge of the feathered songsters around them without alarming them with an array of scientific words and terms.

THE FRUIT MARKET.

THE following letter from a "London Salesman," in *Bell's Weekly Messenger* of February 24, is more encouraging to the fruit-growers of Nova Scotia than to those of the mother country:—

"For some time past considerable discussion has been taking place in regard to the growing of Apples in England, and we have been told by various experts and representatives of horticultural and other Societies that farmers have only to plant orchards, and in a very short time there would be an end to all their trouble; but it seems to me they have failed to recognise one very important fact. It is this, that during the past few years, while we have been talking

and arguing whether this or that soil is suitable, the kind of Apples to grow, who is to compensate the tenant if he plants an orchard and leaves his farm, &c., our great opponents in the fruit trade have been planting—not thousands of acres, but miles of orchards.

At the present time, Ontario, Nova Scotia, the United States, Tasmania, and other places, are supplying the English market with enormous quantities of Apples, but in a very short time, say two or three years, the quantity will be greatly increased, and in, say, six or seven years, they will be enabled to send three or four barrels to every one sent now, the quantity increasing as time goes on; and it is nonsense for nurserymen and others interested in planting orchards in this country to tell us that English-grown Apples will always sell, and make top price, and that the public prefer them, as imported Apples are flavourless, woody, and thick-skinned.

Speaking as a salesman, the buyers prefer bright-coloured, well-shaped, and well-packed fruit, and most of the imported Apples have these qualities; consequently they will always take the lead. Already, at times, this market is blocked with Apples. Take last season, for instance. At this time last year, Canadian, States, and Nova Scotia Apples were sold at 8s. and 10s. per barrel of 3 bushels, and the market was glutted the whole season; when freight and charges were paid, there was very little for the senders, yet they had to send; the Apples were there, and it was better to send to a bad market than not to send at all. English Apples during this period were almost unsaleable at any price.

Of course, this season things are different; the same kind of Apples that were being sold at 8s. to 10s. last season, are now making 24s. and 28s. per barrel. These prices encourage orchardists in America to still go on planting. Take the celebrated Annapolis Valley in Nova Scotia as a single instance. It is from 60 to 70 miles long, and is no doubt one of the most favoured spots for Apples in the whole world. In a very short time it will be one long orchard from Windsor to Annapolis. I don't write this letter to discourage English growers, but to caution them not to expect too great results from young orchards later on."

HARVESTING CHINA GRASS IN WENCHOW.

MR. ALEXANDER HOSIE, Acting Consul at Wenchow, reporting to the Foreign Office on the trade of that port for 1889, refers in the following terms to the cultivation of a fibrous plant which is classed as Hemp, and figures in the trade returns to the value of £1,077. Mr. Hosie says:—

"I presume that this is the fibre of *Boehmeria nivea*, which is cultivated to a limited extent round Wenchow. There is one point in connection with the local growth which deserves more than a mere passing notice. In Western China, and more especially in the province of Ssu-chuan, I devoted considerable attention to the production of this valuable textile. There the stems, when ripe, are cut down, made into bundles, and carried from the fields to the house of the grower, where they are steeped in water, and the bark, with the fibre, removed by hand. Here a different method is practised. When the stems are ripe the peasant removes the bark on the field, in a very simple, ingenious, and, as it appears to me, very profitable manner. Seizing each stem about 6 inches above ground between the thumb and fingers of both hands, a few inches apart, he gives a smart push downwards and forwards, causing a compound fracture of the stem between his two hands. He then inserts the fore-finger of the left hand in the fracture, and draws the bark downwards to the root, where it readily detaches itself. In the same way the remaining bark, and upper part of the stem, which he holds in his right hand, are removed, and by a simple brush of the hand from the root end of the bark upwards, the leaves and stem

are dislodged, and the bark is ready for future manipulation. By this means, as it seems to me, several inches of bark and fibre are saved in comparison with the product resulting from the cutting down of the stems; and as length of staple adds much to the value of the fibre, the plan here pursued would appear to deserve some attention in those countries where the cultivation of *Boehmeria* is of great commercial value. I refer especially to India, where labour is cheaper than in China. Another advantage of the system is, that the discarded leaves and stems remain on the field, and help to manure the other crops."

M. HARDY.

WE are indebted to the courtesy of Mr. Rothschild for the opportunity of giving a portrait of the distinguished Director of the National School of Horticulture at Versailles, who was also the Chairman of the Horticultural Department of the recent Paris Exhibition.

NEW GUINEA.

THE recent expedition of the Governor of British New Guinea, Sir William Macgregor, up the Fly River, has brought still more Australian forms of vegetation under notice, particularly from the delta-estuary of that stream-system. Of plants not previously found outside of Australia, the following occur, now in his Excellency's collection: *Drosera petiolaris*, *Halfordia drupifera*, *Muhlenbeckia rhytidarpa*, *Eucalyptus tereticornis*, *E. terminalis*, *Metrosideros paludosa*, *Tristania suaveolens*, *Melaleuca symphyocarpa*, *Fenzlia obtusa*, *Alextranthus longicornis*, *Mitrasacme elata*, *Plectranthia*, *Humodorum coccineum*, *Gahnia aspera*, *Eriachne pallescens*, and *E. squarrosa*. It seems likely, however, that this Australian element in the lowlands vegetation is confined to the southern part of this great island, the high ranges which extend almost along the whole region, offering a barrier for the migration of Australian plants across to the northern littoral tracts, where species of Sundaic plants would probably be still more numerous than along the southern coast regions. Previously among Australian forms the following were recorded from New Guinea:—*Epomatia laurina*, a species of *Brachycliton*; *Stackhousia viminea*, *Pimelea cornucopia*, a species of *Drapetes*; *Kennedyia retusa*, *Panax Murrayi*, *Passiiflora aurantia*, *Araucaria Cunninghamii*, a species of *Phyllocladus*; *Ilyopxis bygonimetrica*, *Arthropodium fimbriatum*, *Geitonoplesium cymosum*, *Notothixos subarens*, *Banksia dentata*, *Grevillea gibbosa*, and another species; an *Olearia*, *Lagenophora Billardieri*, two *Vittadinias*, *Styphelia montana*, and two other of the *Epacridaceae*, *Astelia alpina*, *Nerotis Banksii*, *Carpina alpina*, *Leptaspis Banksii*, *Dawsonia superba*, and a second species of that genus. This Australian element in Nature is further strengthened by some prominent forms of the Fauna, such as the Wallabies and the Echidnas. Sir William Macgregor's recent gatherings demonstrate also the occurrence of representatives of the following genera, as Papan, *Salomonica*, *Cedrela*, *Sesuvium*, *Pterocarpus*, *Dioclea*, *Modocca*, *Homalium*, *Limnophila*. *Prod. F. Muell.*

EMBOTHRIUM COCCINEUM.

RECENTLY some of our correspondents have favoured us with sprays of this handsome shrub. Very few of the Proteaceous plants are hardy in this country, except in the most favoured parts. The species we now figure (fig. 121), from Chili, may be added to the list, not however, without qualification. In the warm parts of England and Ireland, it grows fairly well at the foot of a west or south wall, either as a free standing shrub or trained to the wall. It is an evergreen with brilliant red-crimson flowers. As it ranges over a wide extent of country, and ascends mountains to a considerable altitude, it is probable that hardier varieties may yet be introduced.

INDIA.

MADRAS.

THE Agri-Horticultural Society of Madras held a moonlight fete in the Botanic Gardens on the night of February 5. Although the Society has now been established for fifty-five years, such an entertainment had never before been given. The experiment proved so successful, that it is hoped that the Committee will be persuaded to hold such a fete annually, and that the weather will always be as favourable as it was on this first occasion.

The Agri-Horticultural Society above mentioned, held its annual flower-show in the Gardens on February 22. The horticultural exhibits were quite up to their usual standard of excellence, but the dry weather which prevailed for some time previously

THE TUNBRIDGE WELLS HORTICULTURAL SOCIETY announces its summer exhibition for Wednesday, July 9, next.

proved rather prejudicial to the food grains. There were many exhibitors, both native and European, and the show was opened by the President of the Society, His Excellency the Governor.

NOTES IN ECONOMIC BOTANY.

THERE can be no doubt that new sources of economic products of vegetable origin do occasionally come into the markets of which we know but little

carpa. This gum has now become a regular article of import.

A new kind of African gum attracted some attention in Mincing Lane, in consequence of its appearing in long, slender stalactite tears, very distinct from ordinary gum arabic; much of it is likewise of a dark brown colour, mixed with a white Tragacanth-like gum. A quantity of this gum recently arrived in this country, and seems to be derived from an entirely different source from any gum yet known in English commerce, namely, from the so-

growing in the latter colony to such a size, that timber may be cut from the trunk 40 to 60 feet long, and from 14 to 16 inches square. The wood is much used in the colony for furniture, as well as for doors, partitions, and flooring; masts and spars, sugar-hogsheads, and various other articles are made from it.

Notwithstanding that the wood has been shown at most of the International Exhibitions as one of the useful products of British Guiana, it does not appear to have come into English commerce

FIG. 121.—EMBODHIUM COCCINEUM. HALF-HARDY SHRUB: FLOWERS GLOWING CRIMSON. (SEE P. 716.)

or nothing, helping, as they possibly oftentimes do, to contribute to the bulk of some well-known commodity. An apt illustration of this may be found in what is commercially or generally known as gum arabic. It is well known that large quantities of this gum come to the London market of different qualities, and under different commercial names; they are, for the most part, however, the produce of species of *Acacia*. Owing to the scarcity that has prevailed of late years in the supply of Suakim gum, many other gums have been introduced, notably in 1888, a Brazilian gum arabic appeared in the market, which proved to be obtained from *Piptadenia macro-*

callid African Mahogany Tree (*Khaya senegalensis*), belonging to the natural order Meliacee, and closely allied to the true Mahogany. The tree grows to a good height, and produces a wood similar in appearance to Mahogany. A sample of this wood recently received at the Kew Museum shows a good, sound, even-grain timber, not unlike good ordinary Mahogany. The wood is not unknown to English hardwood dealers. A closely allied tree—*Carapaguianensis*—also yields an even grained, reddish-coloured wood, and seems to be known in English trade as Assinie Mahogany. The tree is found both in West Tropical Africa and in British Guiana,

from that colony, but figures as a product of West Africa.

Another West African product that has lately appeared in the English market, is a coarse stiff material known as Lagos Piassaba. This substance is strong, tough, and pliable like whalebone, very irregular in its thickness, some pieces being about the same diameter as ordinary *Latia Piassaba*, while other pieces are nearly as thick as a blacklead pencil, but somewhat flattened. It is much darker in colour than the Brazilian product, and on account of its irregularity would apparently be useful only for mixing with the better known article. It is appa-

rently procured from the leaf-stalk of one of the Raphias. That such a material finds a sale proves that there is a demand for brush fibres, and that a really good substitute for Piassaba would be a commercial success; that such could be found amongst the varied Palms in the Brazilian forests we think there can be no doubt. What is wanted is something with equal, or even with greater strength and elasticity than that which we now use so largely. A brush fibre, new to us as such, but of very inferior quality, was shown in the American division of the Paris Exhibition last year. It was labelled as the fibre of the Palmetto, perhaps *Serenoa serrulata*, Hook. f. It was of very uniform thickness, and of a bright reddish-brown colour, but it lacks strength and elasticity. Specimens of all these products are in the Kew Museums.

Turning now from the consideration of new vegetable resources to the development of old ones, we have that of the cultivation of the Castor-oil plant (*Ricinus communis*), which is so largely grown in India, has been taken up in some parts of Hungary, and that at the present time there are over 200 cultivators who are making experiments with the plant. The coming autumn will, it is said, show whether Hungary is likely to be able to compete with British India as a Castor-oil producing country. The experiments made hitherto have yielded excellent results, inasmuch as one culture gave 60 per cent. of oil and 40 per cent. of residue for oil cakes.

Under the name of Chinese Dates, large quantities of fruits are annually exported from China, the average being about 3000 tons per year for the last ten years from Chefoo, besides quantities from other ports, the exports from Tientsin alone in 1887 amounting to 4500 tons. These Chinese Dates are known under a number of varieties, as red, pink, southern, honey Dates, &c., and are furnished by varieties of *Zizyphus vulgaris* and *Z. lotus*, the honey Dates being the fruits preserved in sugar.

Genuine Chinese Star Anise, the aromatic fruits of *Illicium verum*, which is imported into India, America, and Europe for flavouring liqueurs, and spirits, is reported to be exceedingly scarce—indeed, it is said "that there is none available in China."

TREES AND SHRUBS.

LONICERA SEMPERFLORENS MINOR.

This small-flowered variety of the sempervirens *Honeysuckle* makes a splendid covering for pillars or arches in the conservatory or cool houses. Mr. Hudson has it growing at Gannorsbury House over an arch 10 feet high in the conservatory, which at the present time is smothered with its pale orange-red tubular blossoms. When not stifiy trained, the graceful sprays of flowers make it one of the best of plants for a trellis or arch. Cuttings of this species of *Lonicera* strike freely in the spring with the aid of a slight bottom-heat.

CERCIS SILIQUASTRUM (JUDAS TREE).

This subject of Western Asia is rarely met with in gardens, and for what reason it is hard to say, seeing that the tree is a very desirable and effective object during the month of May, the rosy purple flowers, which it produces with great freedom before the leaves become fully open, being very telling; moreover, the tree is quoted in all the leading catalogues of trees and shrubs. There are two old specimens of the Judas Tree here, which flower freely every year; they are about 25 feet high, are growing in a light dark loam, resting on a gravelly subsoil, and sheltered from the north and east; the soil, I may add, is uniformly moist. *E. M., Hants.*

AZALEA NOLII.

In many places one or other of the several varieties of this beautiful Japanese *Azalea* will be in full bloom out-of-doors during the present month. The flowers are very sweet, and range in colour from bright yellow to golden bronze. Although this plant

does best in peaty soil and away from the shade of trees, it will do fairly well in any position and description of mould ranging between chalk and cold heavy loam. Planted either in masses or intermixed with other flowering shrubs in the grounds, or in close proximity to carriage drives, and frequented spots in the park and home woods, the effect is the same—very telling. Therefore, plants which have been forced during the winter months, and which have not yet been disposed of, should be turned out of the pots while quite moist at the roots and planted as indicated, putting a little peaty soil or leaf mould (if more easily obtained), about the roots, making the whole firm before giving water to settle the soil.

CERASUS JAPONICA FLORE PLENO.

Standards and pyramids of this and the numerous other decorative varieties of the Cherry now in cultivation, were until lately objects of great admiration in many nurseries, private and public gardens, especially in those in and about the towns of Bournemouth, Ilfracombe, and Folkestone. They are very telling when intermixed with the pink, scarlet, and purple-flowered Thorns (*Crataegus*) and, like these, they will succeed in almost any position (as long as they are not shaded by trees) and description of soil. *H. W. W.*

VEGETABLES.

GILBERT'S VICTORIA LATE BROCCOLI.

With us, this variety has been very good this year. It is self-protecting, the leaves well covering the heads until it becomes fully expanded. During the past fortnight we have been cutting immense heads of the purest white; and I would strongly advise those who have not yet given this variety a trial, to do so—they will not be disappointed. *G. Summers, Sandbeck Park, June 2.*

THE APIARY.

A NOVEL ENTRANCE TO A HIVE.

As I was paying my usual round of visits, I met an amateur carpenter, who is also a beekeeper, and who makes very good hives for himself. As he does not make them for sale, I can fully describe them for the benefit of my readers. The entrance, then, is at the centre of the bottom of the hive, and running across from side to side. That is, supposing the hive faces south, the entrance would run east and west. The entrance is very narrow; indeed, being only just sufficient for the bees to get in comfortably when loaded. The alighting board projects outwards about 3 or 4 inches, and slopes upwards to the entrance. An entrance of this sort contains everything essential to the comfort and well-being of the bees. First of all, no water can enter the hive from below. The alighting-board forms a grateful place for a loaded bee to rest on before walking up into its hive. Should a mouse desire to walk up, it could do so nearly as far as the entrance, but could not possibly get in, owing to the narrowness of the opening. Certainly there are no means in this hive of partially closing the opening. My friend says he never finds it necessary to close the entrance at all, but leaves it fully open both summer and winter. He says his bees are never robbed in this kind of hive. Somehow or other, stranger bees do not seem able to find the entrance, and those that do, meet with such an army of opponents that they gracefully, or ungracefully, retire at once. I have fully described this entrance because I believe it well worth a trial, and have commenced myself. Most beekeepers agree that there ought to be free ventilation, either at the top or bottom of hives, in winter. Here, then, is the very thing. Good circulation of air without draught, thus allowing the bees to be thoroughly packed at the top, over the frames. The weather is now everything that could be de-

sired for bees, and a good harvest may be expected, if suitable weather prevails for the next two months. On all hands we hear that a great stimulus has been given to the trade this spring, and that dealers in appliances are overburdened with orders. It is hardly necessary to say, give the bees plenty of room by adding frames and supers. It is not necessary to wait for the honey glut for this, but do it at once, so that when the time comes, the bees may have abundance of room for storage. *Agnes.*

HOME CORRESPONDENCE.

FRUIT PROSPECTS.—Unless there is better prospect for tree fruits elsewhere than here in Middlesex, the present year bids fair to be one of the worst for the fruit grower, for I have not gleaned one good report. The stocks of preserves cannot be now large, and makers for sale have been looking forward to the certainty of a good crop generally this season, so that it can hardly fail to force a sharp competition between buyers. The promise in the matter of blossom was a good one, but the set was bad. Plums and Pears seem to be the worst, in the summing-up of the grower, and Apples and Cherries are few. It must not be assumed that the caterpillar pest has anything to do with this barrenness. We have suffered very slightly indeed in West Middlesex from the caterpillar, the good cultivation of the soil serving to keep it in check. The barrenness is rather climatic than otherwise. There was, on the whole, last year, a very favourable time for the production of fruit buds, and these set in plenty, but still they have not stone-buds of the kind to give very high hopes. The comparatively open, soft weather in January, somewhat unduly early excited the buds to motion; then came a long spell of dull, cold weather, with a few severe frosts, and by the time the bloom was expanded, its vital forces were well-nigh exhausted. Bush fruits are both much blighted and thin, and the only really promising crop universally is the Strawberry, and its produce is now dependent upon the weather. *A. D.*

MILDEW ON VINES.—I have for many years paid periodical visits to the chert producing districts of France, and a few years since, noticed with great regret the fearful devastation amongst the Vines, caused by mildew. But the destruction caused by this pest is now arrested by a simple remedy which is generally adopted by the Vine-growers in this country, and is proved to be equally efficacious in other crops. I send it for publication in your paper, and if applied in the early stage of growth, crops of Potatoes, Tomatos, and Rose trees will be entirely freed from this troublesome fungus. The mode of application is as follows: a large tin can containing 2 to 3 gallons is carried on the back, straps passing under the arms keep it in position; from the can a tube of sufficient length to come easily to the front of the body, is provided with a syringe, which enables the operator to apply the liquid in any direction required, by the aid of this simple machine. Remedy against mildew in Roses, Tomatos, Potatos, &c.—1½ lb. quicklime; 3 lb. sulphate of copper; 20 gallons of cold water. Dissolve the sulphate of copper in cold water for two hours in one vessel, in another pour a little water by degrees on the lime, mixing it well till it becomes a milky liquid, then pour the latter into the former, stir them well, and add to the 20 gallons of water already provided. To be applied at intervals of three weeks, and always used fresh. *W. Smith, Bordenax, May 27.* [The copper-sulphate, as we have often pointed out, checks the superficial growth of the Potato and Tomato fungus, but as it cannot reach the interior its advantages are limited. *Ed.*]

PROPOSED PINK SHOW AT MANCHESTER.—A movement is being made with a view to holding a show of Pinks at Manchester during the month of July. It will be proposed that it take place on July 13 in the Botanical Gardens, Old Trafford, in connection with the Rose Show of the Manchester Botanical and Horticultural Society. Mr. Samuel Barlow has the matter in hand, and a circular will be issued asking for support to the proposal, and for subscriptions to a prize fund. There are a large number of growers of Pinks in the north and midland districts, and it is felt that, with their co-operation, a good exhibition could be made. Manchester is a centre readily reached from all parts, and as it is the desire of the promoters that the public should be

interested in the culture of the fragrant Pink, it is obviously a good arrangement to have the exhibition in connection with the annual Rose show at the Botanical Gardens.

THE WEATHER IN MONMOUTHSHIRE.—We experienced a hoar frost on the morning of May 30, the thermometer registered 30°, which severely crippled Potatoes, Scarlet Runner Beans, and other tender plants. The common Bracken, Athyriums, and similar Ferns were also considerably injured. Our bedding plants were fortunately under protection, and escaped what might otherwise have been a serious calamity. *T. Coomber, Hurdle Gardens, Monmouth.*

THE GARDENERS' ROYAL BENEVOLENT.—I have noted with pleasure the lists of promised contributions to be made to the funds of the Institution at the forthcoming annual dinner to be presided over by Mr. H. J. Veitch. I should like, however, to see more gardeners names appear on the lists as annual subscribers, for it must be borne in mind that every subscriber of £1 ls. per annum, is worth at least ten times as much as a donation of one guinea; and what better investment can a gardener make than by subscribing to this fund? None of us may forecast the future, or know what is in store for him. I have not the slightest doubt there are many of the craft now, up and down the country, who heartily wish they had begun to subscribe years ago, so as to be (if not fully) entitled to its benefits, to be at least in a fair way of soon being so, without any of the anxiety and trouble of election. Let me say that it is not yet too late to commence, and I know nothing would gladden the heart of Mr. Veitch more than to receive promises of annual support from gardeners who may not yet have subscribed. I have myself inspected the account-books of the Institution, which are models of exactness and business-like details, and was struck with the admirable manner in which they are kept. The worthy Secretary (Mr. E. R. Cutler), who has served the Institution so long and so well, is only too glad to have an opportunity of showing the books to anyone who takes an interest in the working of the Institution. If purchase is not already a subscriber, he will I know, endeavour to convince him of the great advantages the Institution offers to gardeners, and few will be able to resist his appeal. *James Hulson, Gummershurst.*

PUYA CHILENSIS.—The plant figured in the *Gardeners' Chronicle* of May 31 flowered in the Abbey Gardens, Tresco, Isles of Scilly, for the first time about thirty years ago, and was the first specimen that had ever flowered in Britain up to that time. The photograph from which the engraving was drawn was taken by me about twenty-five years since, at the wish of the late lord proprietor, Augustus Smith, Esq., and copies were sent by Mr. Smith to Sir Joseph Hooker. The taller spike at that time was about 7 feet high, and in its early state of growth resembled a giant head of Asparagus. It has flowered several times since. *J. C. Tonkin, Isles of Scilly.*

—I have often had the privilege of seeing this fine Bromeliad in the Tresco Abbey Gardens. It is growing behind one of the old Abbey walls, and forms a dense thicket of spring foliage. I have never seen it in flower, but the old spikes are allowed to remain on the plants as well as on the *Agave americana*, so that visitors at any season can judge of their nature. One of the most imposing shrubs in the gardens is what the late Mr. Vallance, *requiescat in pace*, told me was Senecio Fosteri, on the authority of Mr. Harpur Crewe or Mr. Lynch of Cambridge. I have not been able to find any mention of this shrub, nor is it given in Brown's edition of *Johnson's Dictionary*. It forms a big spreading shrub with large leaves, the reverse of which is white and downy as in *S. Tussilaginis*. If Mr. Lynch remembers it, he would oblige your readers in Cornwall by mentioning it. *C. A. M. Carnichael.*

IBERIS CORIFOLIA.—Where did this remarkably valuable species come from, and who originated it? I find one list of plants given as having been introduced from southern Europe in 1723; if so, we have had it in cultivation for 150 years. I place it at the head of all the perennial Candytufts. What a nice green tufted plant it makes, and how freely it flowers; and its corymbs of pure white blossoms are as handsome and symmetrical as can well be. It is easily cultivated, and soon becomes a flowering plant. Last year I pulled a plant to pieces, and dibbled them into a cool and moist border, where they soon took root, and they make blooming plants

sometimes the first, and certainly the second year. Some one once termed it the dwarfest and neatest of the perennial Candytufts. I am not sure it is quite the dwarfest, but that it is the neatest there can be no doubt. It appears to be the hardiest of hardy plants; it adapts itself to most soils, even heavy ones; it will flower on a shaded and moist border as on an open and dryish one, though the latter position is preferable. In some localities it may produce seeds; they have appeared in a few instances on my own plants, but as far as my own experience goes they are invariably infertile. If information exists as to its origin, I shall be pleased to be made acquainted with it. *R. D. [Iberis saxatilis var. corifolia, South Europe. See Bot. Mag., t. 1012 (1814), Baker, in Trans. Chron. 1868, p. 712. Ed.]*

EARLY STRAWBERRIES.—I have this day (June 2) gathered a very nice middling-sized fruit of John Ruskin, a new variety, sent out last year by Little & Ballantyne, Carlisle, and there can be no mistake whatever that this variety is the earliest in commerce. I have Laxton's King of the Earlys growing on the same border, which I fully believe will take fifteen days more to ripen; while the great Noble itself, growing immediately opposite, will be at least a fortnight before a fruit is ripe. I look upon this as a great gain in early Strawberries; we have numbers of first-class mid-season varieties, but there is yet room for very early and very late ones. I am this year growing Lovell's Late Pine as a late variety, which at present is just opening its blossom; it is free growing, most prolific and the flavour is good. *R. Gilbert.*

TASMANIAN APPLES.—These Apples seem to bear the long sea transport splendidly, and it they can be sent over in sufficient quantity, we ought to be able to procure sound good Apples throughout the summer months; the flavour is quite up to the mark. The quality of Ewars's Pippin and Rosemary Russet is superior to any specimens of these sorts I have ever come across in England. The Ribstones which I have, are not quite ripe enough to pronounce an opinion upon, but they are fine-looking, firm fruits. What a chance there appears to be to make Apple orchards pay in this lovely island. However, it seems, as in most things, we have heard of the opportunity two years too late. *C. A. M. Carnichael.*

GLOXINIAS AT THE TEMPLE SHOW.—These were shown in splendid condition. Messrs. Sutton had a magnificent lot of plants, and it puzzled the spectators to know how they could have been got to the Temple without a bluish. They consisted of some of the best in cultivation, with a vigorous habit, large blooms in abundance, and showing great improvement. Prince of Wales is a superb variety that should be largely grown; Empress of India is a fine bloom and free. Messrs. J. Veitch & Sons' collection was a grand one, of even more sturdy growth, many of the varieties, particularly the red and scarlet, being the type of what a Gloxinia should be—being dwarf plants, and in some instances carrying dozens of flowers. Flambeau is splendid, also the scarlet Mrs. J. Donaldson, which is a perfect gem among Gloxinias. I had the pleasure of seeing these same plants last week at the Chelsea nursery, and could not but note the excellence of their cultivation, and the advance made in the past few years in a habit, the set-up of the flowers, which come well above the leaves, their great substance, and these being formerly. The blooms do not fall when their beauteous waxes, but require to be taken off. This is a point of great importance, as formerly it was useless to grow these beautiful plants if they had to be shifted to houses at a distance; but now they can be removed without loss of flower, as was demonstrated at the Temple Show. These plants are frequently grown too warm, and shaded too much, and are better and dwarfed when given a fair amount of light in an intermediate-house. *G. Wythes, Syon House.*

NEW FIG ST. JOHN.—This new Fig, shown by Messrs. J. Veitch & Sons, Chelsea, at the Temple Show, will doubtless be a welcome addition to our list of good varieties. It is highly spoken of by the exhibitors, and the small bush in a small pot with a crop of nineteen fruits, proves it to be a free setter, and it is of fair size. One of its chief recommendations is the fine flavour of the fruit, which will soon appear at one of the Society meetings in a ripe state. Many good fruits often get passed over owing to their ripening at a date when their qualities cannot be tested at the Society's meetings; Melons often suffer-

ing from this cause—being either overripe or not sufficiently ripe. If St. Johns Fig could have been shown ripe it would have gained, what I think it deserved, a first-class certificate. It is very distinct in growth from other varieties, and will be valuable for pot cultivation, its free fruiting in a small size being in its favour. Fig trees which are not of rampant growth are always a consideration when fruit-houses are of small size, and especially when they fruit freely on the old wood, as does the St. Johns. The foliage is rather small, also an advantage, as more light will fall on the fruits than can occur with Figs having large leaves. The growth as seen was compact, but not weak and spreading, and no supports appeared to be required. *G. Wythes, Syon House.*

VEITCH'S MODEL BROCCOLI.—The worthy gardener at Stion House tells your readers, if this variety of Broccoli is sown at different times, it comes in at different seasons. This does not meet with my approval; because I believe, if sown in March, April, and May, it will all come in at the same time. Planting in north cold borders is the system which I advocate for very late heads. *R. Gilbert.*

TREATMENT OF BAMBOOS.—I would suggest planting Bamboos on their sides; layering them, in fact, leaving the leaves, or tops of the leafy shoots, only above the soil. As so treated, I find every joint of their stems throws out young shoots, and in this manner they may be very readily increased. Bamboos as planted thus horizontally, 2 or 3 inches below ground level, make well established clumps much more quickly than if planted erect in the usual way. *F. B. B.*

SNOWDROP DISEASE.—Last year (*Gardeners' Chronicle*, May 4, 1880) I reported the appearance of the Snowdrop disease in the gardens at Glamis Castle. The diseased clumps were carefully preserved by Mr. Whitton, with the view of ascertaining whether the bulbs had suffered from the presence of the fungus, *Polyactis galanthina*. The result has been very satisfactory. The bulbs have not been weakened, and no trace of the blight has been observed during the past season. *J. S.*

CHOU DE BURGHEE.—I am a great admirer of the pithy articles penned by Mr. Markham in his departmental notes; still I cannot allow him to say, without a protest, that Chou de Burgheey cracks its heart. I have grown it for many years, both early and late, but have never noticed one cracked, except in the spring, when it bursts and goes to seed. *R. Gilbert.*

ENGLISH-GROWN NARCISSUS AND OTHER BULBS.—As the season for "taking up" bulbs is fast approaching, I would remark that it has hitherto been considered by the British public that all bulbs to be good must come from Holland, but happily the English are fast gaining prestige in this matter—in fact, in many varieties it may be asserted at last England takes the premier position of the world. Take, for instance, English-grown *N. Magni*, *N. Medii*, or *N. coronatus*, and compare flower or bulb with those Dutch-grown, and it is palpable even to the uninitiated that ours are larger bulbs, although not so nice to look at—i.e., they do not rise so clean out of the soil; but this, of course, is a secondary consideration. In ordering bulbs from Holland, the customer often omits to add the cost of carriage—another item of expense not charged for English-grown roots. It is to be hoped that my countrymen will henceforth encourage this branch of industry, there being no necessity whatever to order from abroad when we have so many clever gentlemen ("Quite English, you know") connected with the trade, who can supply any variety in quantity, and who are willing to pay any reasonable amount (and sometimes unreasonable) for distinctly new varieties. The B. P. have only to peruse your valuable columns from September to December, and compare prices with Dutch catalogues and auctions, and I am sure they will see how beneficial to themselves it will be to encourage the home trade, bearing in mind that the bulbs are acclimatised, and are sent out carriage free. Whilst on this subject, it is strange to note that the locality where most bulbs are grown, and where they thrive of all places in England the best, is the Holland division of Lincolnshire, where acres may be seen covered with a profusion of bloom. The London firms, I am glad to remark, extensively patronise these growers, often ordering upwards of 500,000 of a single variety, and I trust the time is fast drawing near when it will

not pay Dutch firms to appoint agents in England. These few remarks may call forth indignation and retaliation on the part of the foreigners, but I shall leave it to abler and more experienced hands to champion the cause. Apologising for occupying so much of your valuable space. *O. W. D'Alcorn, Spalding, Lincoln.*

AN ORNITHOLOGICAL OBJECT-LESSON.—When almost insane proposals are being made to destroy birds wholesale by poison or other means, I would invite attention to a charming object-lesson which was to be seen just beyond the window, by the side of which I now sit writing. Early in the spring, a large flower-pot having been used to cover a plant, was left close by, bottom upwards. Later, a bird was seen to issue from the hole of the pot, and on lifting the pot I found that a commencement had been made towards constructing a nest on the soil, covered by the pot. The builders proved to be that far from common bird, the Long-tailed Monseet (*Larus condatus*). In time, having floored the whole of the soil within the pot with moss, hair, and other soft materials, a hollow was made in the ground, not just in the centre, but on one side, and this was lined with hair and wool, and also was so covered with the material, that search had to be made carefully before the nest was discovered. Presently, one egg, and then another, was laid, until about a dozen little whitish eggs, covered with brown spots, were deposited. Then the hen bird began sitting, and so time was she, that when the pot was lifted off to show visitors the pretty sight, she sat still, and showed no fear. Finally, the eggs were hatched, and then began the labour of feeding. The titmouse is a voraciously insectivorous bird, and in feeding its nest of little ones for several weeks consumes myriads of caterpillars, and the object-lesson is found in the entrance and exit of the parent birds, apparently every minute, all day long, feeding the young. What these and bushes, literally millions of other birds are doing daily; and but for their untiring labours, we might have hardly a green leaf left on the trees. I have grave doubts as to the value of insecticide poisons as compared with the labours of the small birds. *A. D.*

AN OLD VARIETY OF RHUBARB.—I have in cultivation the variety of Rhubarb mentioned in London's *Gardener's Magazine*, iv., 105, derived by me from my uncle's garden, Rev. T. Gisborne, named there. Can you tell me what it is now called, and to what species it belongs? It is a beautiful plant for tarts, for there are no woody fibres in the stalks, and therefore it has not to be peeled before it is used. Its colour, very dark scarlet, and its remarkable flavour render it a most acceptable plant. I have never seen it except in the late Mr. Gisborne's garden and my own. The want of woody fibres in the petioles seems to me very remarkable. Also what is the species to which the common cultivated Rhubarb belongs. I have found much difficulty in deciding these points. The red one seems to be undulant; is the common green plant hybrid? *C. C. B.* [Rheum raphaniticum, or a variety of it. Rhubarb varies considerably when raised from seed. Ed.]

VITALITY OF FERN SPORES.—In my work-room window a Palm has been growing from naked soil in a pot for four years; this spring a small Maiden-hair Fern, and two other small Ferns have sprung from the soil; apparently from spores. *W. G. S.*

RAMONIA PYRENAICA.—This species in very good here now in a pocket on the top of a 4-feet high wall, in partial shade, and bearing sixty fully open flowers and buds. Edelweiss, in full sunshine, is very silvery and bright, although our best plant is showing twenty flower-buds in partial shade. Indoors a Cattleya Warneri rivals the old *C. labiata* in size and colour, and *Odontoglossum vexillarium*, with nine spikes and about forty flowers, is fresh and beautiful. *Iris sutsiana*, in the open border, is fluttering its speckled wings in the sun, and a form of *Iris sub-biflora* (Brotero), from Mount Athos, has just flowered here for the first time. *F. W. Burbidge, Dublin.*

CHEIRANTHUS MARSHALLI.—Is not this fine and showy perennial in some danger of being lost to gardeners? One occasionally sees plants of the pale-coloured *C. ochroleucus*, but very rarely *C. Marshalli*; and yet the last, from its depth of deep golden colour, is decidedly preferable to the paler

type. It makes an excellent border plant, but prefers a fairly dry, open, and somewhat elevated position. I saw it stated a short time ago, that this showy perennial resulted from a cross made between the common Wallflower and an Alpine form. This is not correct; it came from a cross between *C. ochroleucus* and the annual *Erysimum Peroffskianum*, see *Gardeners' Chronicle*, August 28, 1875, p. 272, the latter, no doubt, being the seed parent, and if any one succeeds in obtaining seeds of *C. Marshalli*, it will be found that the seedlings very largely revert to *E. Peroffskianum*, and but very few are true to *C. Marshalli*. I have seen seedlings produced on several occasions with the same result. The best way of propagating *C. Marshalli* is to take cuttings in spring, putting them into pots of light sandy soil and rooting them under a handlight. Increase can also be had by dividing the plants in autumn, as it will be found that the side shoots put forth roots such as *Pansies*, *Polyanthuses*, &c., do, and if these are taken off, carefully potted, and kept in a frame for a time, they soon make good plants. But it would be a pity if this showy and useful plant were quite lost to gardeners. *R. D.*

THE HARDY FRUIT GARDEN.

INSECTS AND ROOT WATERING.—Easterly winds, with scorching sun, have brought us quantities of aphids, as is commonly the case at this season. Prompt measures must be taken to ensure their destruction by the use of the hose and garden engine and soap-suds, clear water being applied afterwards with good force to clean off the dead. On light soils watering may now be necessary, but on heavy ones, if the ground was mulched, it will not be wanted. Peaches and Apricots need much water at this season, unless the drainage of the borders is imperfect. It should be remembered that one thorough watering is worth half-a-dozen dribbles, especially to trees that have set a large quantity of fruit, and any stinting will lead certainly to excessive natural thinning of the fruit, and small size in what remains.

Summer Pruning.—By this time the disbanding of Peaches and Apricots will have been finished, and cutting in and stopping of gross shoots will require attention. It is a wrong supposition that trees trained on the extension system in its entirety are those which are chiefly liable to rush into too robust growth. My experience is, that it is rare to find watery shoots in a tree which requires pinching to maintain the proper balance of the sap. All leaders should be secured to the wall before they run the chance of injury from rain or wind. In gardens where the wall surface is great and labour limited, it is a great saving of time to fasten in the breastwood on wall trees with small twigs, pieces of Privet, or Willow, or even Bracken cut the previous autumn and dried. With these each shoot may be kept in its proper place by pushing the splints under the fastened branches. If the walls are wired, the work is more expeditiously performed. If portable copings have not been removed, frequent syringing of the trees will become necessary, also copious root waterings if the border be well drained. Pears on south and west walls, also the forwardest of the pyramids, will now be sufficiently advanced in growth to have the shoots stopped and thinned. Some years ago it was the practice to allow unrestricted growth of breastwood until the middle of the month of July, but now most good fruit growers constantly practice pinching of the stronger shoots, which invigorates the weaker ones, and leads to the formation of fruit-spurs; whereas July pruning produces a check, at the time when the half-swelled fruits are in the greatest need of encouragement. The early thinning of the fruits on Pear trees should not be done without thought, as many promising-looking fruits will fall off afterwards; heavily-cropped trees may, however, be relieved of some of their redundant fruits, by taking off those badly-formed.

Strawberries.—The plants, owing to the rainfall up to this date being much under the average, will need watering generally in light soils. Early varieties, such as Black Prince, Vicomtesse Héricart du Thury, &c., are all sure to suffer, unless they are kept growing freely. At this stage it is a good plan to water the soil with clear water, afterwards giving a soaking with manure-water. All plants are throwing up spikes in great abundance, and weak

ones may be thinned out, regulating the matter according as the fruit is for show, private use, or, to be grown in quantity. *A. Evans, Lythe Hill.*

SOCIETIES.

ROYAL NATIONAL TULIP.

THE annual Exhibition of this Society took place on the last day of the great Whitson Exhibition, a portion of the concert-hall being set apart for the purpose, but so large a number of exhibitors brought their flowers, that a considerable addition of table-room had to be made. The fixture appeared to exactly suit the Lancashire and Cheshire growers, and the Stockport men especially came in strong force. Mr. James Thurston, of Cardiff, a noted raiser and exhibitor of Tulips, said there had never before been such an exhibition of Tulips in Manchester. Exhibitors came in large numbers, and in some of the leading classes there were from ten and eleven to sixteen and seventeen entries.

In the class for twelve dissimilar Tulips, two feathered, and two flamed, in each class there were six competitors—an unusual number; and some of the exhibitors appeared to have experienced some difficulty in obtaining two feathered byblomeus, and in one or two cases they came perilously near to each other. A byblomeus that in its pencilling approaches a shade of rose, or a rose that has its colouring approaching black, are practically between the two classes, and serve to weaken a stand.

Turner Memorial Special Prizes.—Interest centred in the special prizes offered by the Turner Memorial trustees. The first was for twelve dissimilar named Tulips, six rectified and six breeders. There were four competitors, but one had to be disqualified, by reason of there being two byblomeus breeders the judges ruled were not dissimilar. In this class, Mr. Samuel Barlow, J.P., Stakehill House, Manchester, was 1st, with bizarres; feathered William Wilson, and flamed, Sir J. Paxton; roses: feathered, Modesty, and flamed, Mabel; byblomeus: feathered, William Parkinson, and flamed, Walker's Duchess of Sutherland. Breeders: bizarres, Sir J. Paxton and Hepworth's 27 A, a very beautiful bright red flower; roses, Annie McGregor, very bright, and Mrs. Barlow; and byblomeus, Glory of Stakehill and William Parkinson—a medium-sized, even, fresh, and bright stand of blooms. 2nd, Mr. F. H. Wood, Royton, with bizarres, Masterpiece, and flamed, Sir J. Paxton; roses: feathered, Heroine, and flamed, Mrs. Lomas, very fine; byblomeus: feathered, Mabel, and flamed, Talisman. Breeders: bizarres, Sir J. Paxton and Lord Delamere; roses, Miss Burdett Coutts and Annie McGregor; byblomeus, Alice Grey and Storer's No. 12.

The second class was for six dissimilar seedling Tulips, three rectified and three breeder. Here Mr. Barlow was again 1st, with bizarre-feathered Gill's seedling and flamed byblomeus Johnson's Bob Morley, and rose Miss Hardy (Hardy); his bizarre, rose, and byblomeus breeders being all seedlings raised by the late John Hepworth. Mr. James Thurston, Richmond Road, Cardiff, who had bizarre-feathered, rose flamed, and byblomeus flamed, and breeders, two bizarre and one byblomeus, all seedlings.

Rectified Tulips.—The cup class, as it is termed—that for twelve dissimilar Tulips, two feathered and two flamed of each class, brought six competitors. Mr. James Knowles, Stalybridge, being placed 1st with bizarres, feathered, Sovereign and Sir J. Paxton; flamed, Sir J. Paxton and Dr. Hardy; roses: feathered, Mrs. Hepworth and Conerby Castle; flamed, Amazon and Talisman; byblomeus: feathered, Heroine and Modesty; flamed, Triomphe Royale and May Tints. 2nd, Mr. W. Kitchen, with some capital flowers also, viz.—bizarres: feathered, Typo and Masterpiece; flamed, Typo and San Jose; roses: feathered, Minerva and Comte de Vergennes; flamed, Queen Henrietta and Mabel; byblomeus: feathered, Violet Amiable and Trip to Stockport; flamed, Adonis and Seedling.

Out of eleven competitors in the class for six dissimilar flowers, of one of each class, Mr. D. Woolley, Stockport, was placed 1st with bizarres; feathered, Typo; and flamed, Sir J. Paxton; roses: feathered, Mabel, and flamed Olivia; byblomeus: feathered, rose Triomphe Royale; and byblomeus, Talisman.

Maiden Growers.—Two flowers were required, one

feathered and one flamed. Here Mr. John Hayes was 1st, with a friz-feathered and flamed, but unnamed; 2nd, Mr. Samuel Johnson, Stamford, with bizarre flamed Sir J. Paxton, and byblomen flamed Lord Frederick Cavendish.

Single Blooms.—These were staged in very large numbers, and the leading awards were as follows:—Bizarres, feathered, 1st, Mr. B. Simonite, Sheffield, with Masterpiece; 2nd, Mr. H. Housley, with Lord Lilford; 3rd, Mr. John Hayes, with Sir J. Paxton; bizarre; flamed, 1st, Mr. H. Housley, with Sir J. Paxton; 2nd, Mr. D. Woolley, with the same; 3rd, Messrs. Stuart & Mein with Dr. Harding; roses, feathered, 1st, Mr. John Hayes, with Industry; 2nd, Mr. W. Kitchen, with Comte de Vergennes; 3rd, Mr. Housley, with Alice, King of the Universe, and flamed Walker's Duchess of Sutherland; 2nd, Mr. W. Kitchen, with bizarres, feathered Paul Pry, and flamed San Josef; roses, feathered, Comte de Vergennes, and flamed Clio; byblomens, feathered, Paul Pry, and flamed Seedling.

A similar class is also provided for half-guinea subscribers. Here Mr. H. Housley, Stockport, was 1st, with bizarres, feathered Lord Lilford, flamed Sir J. Paxton; roses, feathered Alice, flamed Annie McGregor; byblomeless, feathered Agnes, flamed Lord Denman. 2nd, Mr. R. Wolfenden, Koyton.

Feathered Tulips.—The class for three varieties, one of each, brought a large competition, Mr. Samuel Barlow being placed 1st, with admirable blooms of bizarre Sir J. Paxton, rose Annie McGregor, and byblomen Violet Amiable; 2nd, Mr. James Knowles, with bizarre Stover's Seeding, rose Industry, and byblomen Conerby's Seedling.

Flamed Tulips.—There was a still larger competition in this class, and Mr. H. Housley was 1st, with bizarre Sir Joseph Paxton, rose Annie McGregor, and byblomen Lord Denman; 2nd, Mr. Thomas Holden, Koyton, with bizarre Sir J. Paxton, byblomen Lord Denman, and a rose unnamed.

Roses, flamed.—1st, Mr. W. Kitchen, with Mabel; 2nd, with Madame de St. Arnaud.

Byblomens, feathered.—1st, Mr. W. Dymock, Stockport, with King of the Universe; and 2nd, with a seedling.

Byblomens, flamed.—1st, Messrs. Stuart & Mein, with Talisman; 2nd, Mr. D. Woolley, with the same. There is a rule governing these classes, that the variety winning the 1st prize may win once again, with this exception all flowers awarded prizes must be dissimilar.

Breeder Tulips.—Great beauty and variety was manifested in breeder or seedling Tulips. Some of the bizarre breeders being of a bright rich red and scarlet shades; but many of them having shades of bronze and brown are somewhat dull-looking. The bright deep rose-coloured breeders, like Annie McGregor, are very beautiful and effective, the paler coloured tints like Mrs. Barlow, are not less winsome, and among the byblomens there are charming tints of lilac and mauve, deepening to violet and purple. Occasionally a Tulip misses the breeder stage, and blooms for the first time a rectified flower. Some very promising seedlings bloomed this season by the Rev. F. D. Horner, never took on the breeder or self form.

The leading class was one for six dissimilar blooms, one of each. Here Mr. A. Moorhouse was 1st with bizarres, Sir J. Paxton and Dr. Hardy; roses, Miss Hudley and Mrs. Barlow; byblomens, Leuch's Seedling and Queen of May—all large and very fine. 2nd, Mr. Samuel Barlow, with bizarres, Sir J. Paxton and Heyworth's 27; roses, Annie McGregor and Miss B. Clonty; byblomens, William Parkinson and G. G. of Stakehill—a beautiful lot of flowers, but undersized. 3rd, Mr. W. Kitchen.

There were fifteen stands of three breeder Tulips, one of each class, and here Mr. J. Cliffe, Nesbitt House, Leeds, was 1st, with very fine blooms of bizarre, Hardwick's No. 25; rose, Queen of England; and byblomen, Parker's King. 2nd, Mr. W. Kitchen, with bizarre, Sir J. Paxton; rose, Rose Hill's and byblomen seedling. 3rd, Mr. A. Housley.

Premier Tulips.—The premier feathered bloom selected from the whole show was Masterpiece, from Mr. B. Simonite, pure rich golden ground, handsomely feathered with bronzy black. The premier flamed flower was Sir J. Paxton, shown by Mr. D. Woolley, one of the most constant and useful Tulips ever raised, whether in the breeder or rectified form; and one that will immortalize the raiser, William Wilson, for years to come. A bloom of this, shown by Mr. A. Moorhouse, was selected as the premier

breeder; but the northern judges appear to have a great partiality for this flower, probably on account of its being so thoroughly reliable. *R. D.*

VARIORUM.

AGRICULTURAL RESEARCH ASSOCIATION.—Professor JAMESON, the Director, has issued the following Recommendation Circular for 1890:—

MANURE.

For Roots.—2 cwt. per acre of steamed bone-flour, 2 do. ground coprolite, 2 do. slag, ½ do. nitrate of soda, ½ do. nitrate of potash, 15 tons farmyard manure.

For Grain Crop.—½ cwt. per acre of steamed bone-flour, 1 do. superphosphate, 1 do. nitrate of soda, ½ do. nitrate of potash.

For Grass.—1 cwt. per acre of nitrate of soda, ½ do. nitrate of potash, ½ do. superphosphate, ½ do. steamed bone-flour.

Qualities of the above Manures.—The steamed bone-flour should contain about 12 per cent. phosphorus; the coprolite, 11 do. phosphorus; the slag, 6 do. phosphorus; the superphosphate, 6 do. phosphorus; the nitrate of soda, 15 ½ do. nitrogen; the nitrate of potash, 13 do. nitrogen and 36 ½ do. potassium. The steamed bone-flour should be nearly white, dusty, and almost as fine to the touch as Wheat-flour; the coprolite should be grey (not brown, yellow, nor red), and almost as fine to the touch as Wheat-flour; the slag should be brownish, and almost as fine to the touch as Wheat-flour. Each of these three forms of insoluble phosphate should be guaranteed that 90 per cent. passes through a sieve of seventy-five meshes to the inch. The superphosphate should be friable or powdery, and hardly adhere when grasped in the hand; the nitrate of soda should be pulverised, and passed through a 1-inch sieve; the nitrate of potash should be white, and in fine powder, like the finest table salt.

GRASS SEEDS.

	Lb. per Acre.
Perennial Rye	104
Italian Rye	51
Cocksfoot	24
Meadow Fescue	31
Tall Fescue	2
Dog-stail	1 ½
English Red Cow-grass	31
White Clover	1
Dutch	1
Yellow	1

"Best, clean, pure seed" should be ordered, with guarantee of "proportion of germination," and "proportion of pure seed."

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending May 31, is furnished from the Meteorological Office:—

"The weather during this period has been generally fine over the greater part of England, but in Ireland and Scotland it has occasionally become unsettled and rainy. Smart thunderstorms were experienced over the south-west of England, and in some parts of Ireland, on the 25th. Showers of snow and hail occurred in the north of Scotland on the 30th.

"The temperature was high at the commencement of the week, when the maxima varied from 65° to 74° in Scotland, from 74° to 79° in Ireland, and from 69° to 81° over England. It soon fell, however, and became low for the time of year. During the latter part of the time the minima were unusually low. On the night of the 30th—31st, the sheltered thermometer fell to 29° in England, S.W., and Ireland, N., to 32° in the Midland Counties, and Ireland, S., and to between 33° and 35° in most other districts. In the 'Channel Islands' the lowest reading was 47°. The average value for the week has just equalled the mean in

'Ireland, S., but in all other districts it has been below the deficit having ranged from 1 to 3°. "The rainfall has been rather more than the mean in the Channel Islands, but in all other parts of the kingdom it has been less than the normal amount. "Bright sunshine has been fairly prevalent in all districts excepting 'Scotland, N.' In that district the percentage of the possible duration was only 22, but over the greater part of England and Ireland the percentage ranged from 47 to 59, while in 'Scotland, W.,' 64 per cent. was recorded."

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.	
	ACCUMULATED.				INCHES.		PERCENTAGE OF POSSIBLE DURATION.	
Above (+) or below (-) the Mean for the week ending May 31.	Day-deg. Above 42° for the Week.	Day-deg. Below 42° for the Week.	Day-deg. Above 42° difference from Mean since Jan. 1, 1890.	Day-deg. Below 42° difference from Mean since Jan. 1, 1890.	10ths of an Inch.	No. of Rainy days since Jan. 1, 1890.	Total fall since Jan. 1, 1890.	Percentage of possible Duration since Jan. 1, 1890.
1	3	34	3	+ 129	70	1	102	19.8
2	2	50	3	+ 56	58	2	86	11.5
3	3	48	0	+ 25	93	3	74	8.1
4	3	65	0	+ 7	39	3	78	8.4
5	3	66	2	+ 8	26	3	72	8.6
6	1	84	0	+ 29	48	3	71	10.0
7	2	55	1	+ 79	73	2	90	19.0
8	3	63	0	+ 64	81	1	81	12.1
9	1	82	0	+ 27	12	2	86	14.7
10	2	64	0	+ 32	51	1	95	11.0
11	0	84	0	+ 21	14	2	98	18.2
12	1	84	0	+ 106	22	2	93	13.5

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts.—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing and Pasture Districts.—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

MARKETS.

COVENT GARDEN, June 5.

A brisk business doing this week, but with heavy supplies prices remained unaltered. Strawberries are firm, but Grapes are with difficulty cleared at last week's quotations. Best Peaches in demand, samples being generally poor. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES. s. d. s. d.

Aralia Steudlii, doz.	6 0-12 0	Foliage plants, various, each	9 0-10 0
Arum Lilies, per doz.	8 0-12 0	Fuchsia, per doz.	6 0-12 0
Aspidistra, doz.	18 0-42 0	Heliotropes, per doz.	5 0-8 0
Asplenium, each	7 6-10 6	Hydrangeas, doz.	12 0-18 0
Andros, various, each	2 0-3 0	Ivy (Geranium), per doz.	3 0-6 0
Begonias, per doz.	6 0-18 0	Liliums, various, per doz.	15 0-30 0
Cactus, doz.	12 0-24 0	Lily of the Valley, p. doz.	9 0-18 0
Calceolarias, p. doz.	6 0-9 0	Magnolia, per doz.	4 0-8 0
Cyperus, per dozen	4 0-12 0	Mignonette, per doz.	4 0-8 0

Roses, lb.	0 6-3 0	Strawberries, lb.	1 0-4 0
Lemons, per case	12 0-20 0		
Melons, each	1 6-3 0		

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Leeks, Lettuce, Mushrooms, Potatoes.

NOTICES TO CORRESPONDENTS.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

ADDRESS: E. N., who sent a note about Pelargonium seeding, must send his full name and address, not necessarily for publication, but as an earnest of good faith.

ANTHURIUM DOCHYLE-SPATHIFOLIA: F. H. Yes, there have been many such. Petals of Anthurium are exceedingly minute.

BAMBUSA PALMATA: B. Latour Marillac. The plant figured by Mr. Burbidge in our number for May 24, p. 641, under this name, is the Arundinaria Veitchii of N. E. Brown, Gardeners' Chronicle, April 27, 1889, p. 521. It is also the Bambusa Veitchii, of Carrière, in Revue Hortic., 1888, p. 90.

BEGONIA SEMIPELLORENS ALBA: F. H. Yes, obtainable at most nurseries. There are several varieties—carminea, gigantea and rosea, and there may be one of these with variegated foliage.

BOOKS: D. Croll. The list appeared in our issue for January 4, p. 13.

COST OF COMMENCING BUSINESS WITH GLASSHOUSES: Flos. We are quite unable to answer your question in the absence of all details.

FASCINATION: B. This is probably due to overgrowth from a too large supply of food. The consequence of this is that an abnormal number of buds is formed. These are carried up by the growth of the primary shoot, but do not, except to a relatively small extent, separate one from the other, or lengthen into shoots.

GROWTH ON ORCHID PEAT: Canjor. We cannot ascertain what it is. Send some more, packing it in some moist medium.

INSECTS: Old Subscriber. The grubs sent are those of a weevil.

LEARNING TO PRUNE FRUIT TREES: Flos. The matter is not so simple as you may suppose, and to learn it properly you should take lessons in the particular branch you wish to master from a gardener who is a master of the art. M. du Breuil's Fruit Trees, from the French (Lockwood & Co., 7, Stationers' Hall Court, Ludgate Hill), would be of considerable assistance.

MELON LEAVES OUT OF CONDITION: J. S. We can detect neither fungus or insect work on the leaves sent; the faint, pallid, waxy spots are, perhaps, mere scorplings, or they may be caused by some error in treatment, or by something wrong at, or in, the roots. It too often happens that the mere sending leaves to us for an explanation of ill-health, is like sending a lock of a dying man's hair to a doctor, with a request for the name of the ailment the man is afflicted with.

NAMES OF PLANTS: F. E. 1, Centaurea montana, white form; 2, Olearia Gunniana; 3, Hemenocallis flava; 4, Barbara vulgaris, double flower; 5, Lupinus polyphyllus; 6, Lupinus, white var.—Southampton. Agave reptans, Bugle.—Young Florist. Asphodelus ramosus.—Bertholus. Very near Oncidium sarcode, but uncertain if it be a new species, or a peculiar and distinct variety. Please send when it flowers again.—A. Z. M. tro-sideros robusta.—J. W. B. 1, Phytolita; 2, Lonicera hirsuta; 3, Cytisus Adami; a cross between C. purpureus and C. Laburnum; 4, Berberis vulgaris, purple-leaved variety; 5, Polygala vulgaris; 6, Geum rivale.—A. C. Phytolacca decandra.—A. H. H. Dendrobium littiflorum.—Canjor. Dendrobium mesochlorum; Epidendrum varicosum.—W. H. Buddleia globosa.—Thos. Evans. 4, C. Mendelii, a very fine form, with richly-coloured buds; 6, also good—both these beyond the average; 3, ordinary light coloured; 7, a fairly good Mossie; 8, large-flowered form, with prettily-mottled lip.—W. T. S. 1, Iliabenaria viridis; 2, Orchis pyramidalis; 3, Stachys sylvatica; 4, Senecio, no flowers; 5, Ceanothus crocata; 6, Hippocrepis comosa; 7, Ranunculus arvensis.—Captain A. Saxifraga Maweani; Orobus luteus; Lithospermum purpureo cerealeum.—W. S. C. P. 1, Iris spuria; 2, Iris Gueldastredtii; 3, Ereunurus caucasicus; 4, Biscutella levigata; 5, Saxifraga rotundifolia; 6, Senecio squallidus.—G. Paul. Orchis ustulata.—L. G. Rugby. Asphodelus ran-

mosa.—No name with specimens 1, Saxifraga Andrewsii; 2, S. cuneifolia; 3, Veronica dentata; 4, Cerastium tomentosum; 5, Sedum Sieboldi; 6, Sedum rupestre; 7, Saxifraga hypnoides.—H. G. 1, Oncidium hastatum, a fair variety, tolerably common in gardens as O. stelligerum; 2, Dendrobium Wardianum; 3, Cattleya Forbesii, H. King. Laelia Boothiana (syn. Cattleya lobata); it is a very fine variety, but we do not know if the name rosea has been applied.—George. Thunia Marshalliana.—O. Orpet. 1, Acridis crispum; 2, Dendrobium lasioglossum.—C. Stewart. Your Cattleya gigas is, as you suggest, a remarkably fine variety.—F. Briggs. 1, Miltonia vexillaria; 2, Trachelospermum jasminoides; 3, Odontoglossum Rossi majus; 4, Onychium japonicum; 5, Gymnogramma ochracea.—Carnation. The Fern is Pteris argyrea. We cannot undertake to name florists' varieties of flowers.—J. L. Asphodelus ramosus. The other specimen is a Kule, or something of that kind.—J. N. Jersey. 1, Plectranthis orientalis, probably, but we cannot be sure from the piece sent. 2, Sequoia gigantea (Washingtonia); 3, Ilex (Holly), perhaps ligustrina; 4, Pinus pinaster; 5, Pipturus Tobra; 6, Prunus Padus; 7, Eucalyptus globulus.—L. L. 1, Iris versicolor; 2, Oxycia reiciformis; 3, Rubus nutkaensis; 4, Anemone ranunculiflora.

PARIS GREEN: J. C. Paris Green is arsenite of copper, and is applied when mixed with water. We should not advise its use on Cabbages.

PELARGONIUM HARRY HIE-OVER: F. H. Is a dwarf single-flowered variety, now not much employed. We have no knowledge of a double one.

PHLOX FRONDOSA: C. W. D. The only references I can find for Phlox frondosa are in Vilmorin-Andrieux, Fleurs de Plaine Terre, p. 866, where it is merely quoted, "P. frondosa, Hort." as a synonym of P. subulata, L.; and in Nicholson's Dictionary, where it is considered to be a distinct variety of P. subulata. There are no specimens named P. frondosa in the Herbarium, N. E. B.

POTATO: A. P. The example forwarded to us is putrid throughout. Such a state of things is common where Potatoes at first slightly diseased have been stored. The seed, as you say, may have been bad, but no nurseryman would knowingly send out bad seed. W. G. S.

STRAWBERRY CLUMPS: Young Gardener. It will be the fourth year of their age in 1891, and Strawberries are usually less prolific—at least, of large fruits—at that age, than young plants. There is no reason to suppose that the plants, if carefully removed with a good mass of soil to each, would not succeed when planted in a bed in the low house; but young plants raised from the earliest runners, would give more and better fruit.

STRAWBERRY AUGUSTE NICASSE: G. Wyches. The fruits were well developed, indeed some were very large, and the flavour good for indoor fruit. As a variety for mid-season and late forcing, it is excellent.

SULPHATE OF COPPER FOR VINES: H. C. See p. 713 of this issue.

TOMATO FLAGGING: G. Restall. Injury to the stem or main roots by weevils, moles, mice, or too strong manure, especially artificial ones, may be the causes; but as you do not furnish us with the least bit of information, we are unable to assist you further.

WARTS ON VINES: C. These are outgrowths from the surface of the leaf, resulting from a want of adjustment between the amount of moisture supplied and the quantity that can be evaporated from the leaves; in other words, from a moist, stuffy atmosphere. The remedy is, to give more air.

Includes Abutilons, Azaleas, Bouvardias, Callaethiopia, Carnations, Calla lily, Eucharis, Gardenias, Iris, Lily of the Valley, Heliotropes, Lilac, White, Fern, Liliac, White, Fern, Lily of the Valley, Pansy, Pyrethrum, Roses, Tea, Tulips, Ranunculus, Spireas, Stephanotis, Tulips.

ORCHID-BLOOM IN VARIETY.

SEEDS.

LONDON: June 4.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write that to-day's market, as might have been expected, was most sparsely attended, with almost a complete absence of business. No attention whatever is just now devoted to Cloverseeds. A few parcels of Trefoil have been changing hands. There is still a demand for sowing Tares. Blue Peas firm. Bird-seeds unaltered. Feeding Linseed slow. Rapeseed and Mustard steady.

CORN.

Averages.—Official statement of the average price of British corn, imperial measure, for the week ending May 31:—Wheat, 32s. 11d.; Barley, 29s. 5d.; Oats, 13s. 10d. For the corresponding period last year:—Wheat, 28s.; Barley, 21s. 2d.; Oats, 18s. 1d.

FRUIT AND VEGETABLES.

SPITALFIELDS: June 4.—Good supplies of fresh vegetables, new and old Potatoes, demand fairly active. Short supply of fruit, demand good. Prices: Cabbages, 1s. 6d. to 5s. per tally; Cauliflowers, 2s. 6d. to 6s. do.; Radishes, 3s. to 5s. 6d. do.; Spinach, 1s. to 1s. 6d. per bushel; Asparagus, 1s. to 2s. per bundle of 100 heads; Seakale, 1s. to 1s. 6d. per punnet; Greens, 1s. 6d. to 2s. per dozen bunches; spring Onions, 1s. 6d. to 2s. do.; Parsley, 1s. to 2s. 6d. do.; Mint, 2s. to 2s. 6d. do.; Horseradish, 1s. to 1s. 4d. per bundle; Cos Lettuces, 6d. to 1s. per score; Cabbage do., 6d. to 1s. per dozen; Endive, 1s. to 1s. 6d. do.; Mustard and Cress 1s. 6d. to 2s. per dozen baskets; Egyptian Onions, 7s. to 7s. 6d. per cwt.; Beetroots, 4d. to 8d. per dozen; natural Rhubarb, 1s. 6d. to 2s. 6d. per dozen bundles; Foreign Tomatoes, 2s. to 3s. per box; Gooseberries, 4s. 6d. to 5s. 6d. per half-sieve.

POTATOS.

BOROUGH AND SPITALFIELDS: June 3.—Scotch Regents, 45s. to 48s. Magdams black, 37s. 6d. to 40s.; Lincolns, 40s. to 60s.; Yorks, 55s. to 75s.; Kent and Essex, 50s. to 55s.; Scotch, 70s. to 110s.; Imperators, 40s. to 70s.; New; Malta and Canary Islands, 4s to 6d. Jersey, 610 to 612 per ton.

SPITALFIELDS: June 4.—Quotations:—New: Jersey potatoes, 6s. to 6s. 6d. per cwt.; do. kidneys, 7s. to 7s. 6d.; do. bukess, 7s. to 9s.; St. Malo rounds, 6s. to 6s. 6d.; do. kidneys, 7s. to 8s.; Lisbon rounds, 5s. to 5s. 6d. per cwt. Old: Magdams, 35s. to 70s.; Regents, 35s. to 70s.; Champions, 40s. to 50s.; Imperators, 40s. to 70s.; Hebrons, 30s. to 40s. per ton.

THE
"NEW EASY"
 LAWN MOWER.

HAS AN OPEN STEEL ROLLER.
 A man can work a 24 inch machine without assistance.

The Front Roller, with simple adjustment for regulating height of cut, enables the machine to cut close to the ground, and to do fine work, besides adapting it for verge cutting.

There is no easier working, no better finished, no stronger, no more durable mower in the market.

To be obtained through all the leading Ironmongers and Seedsmen, or from the Sole Licensees.

MR. JOHN COLLYER, formerly Head Gardener to Wm. Baring, Esq., Norman Court, Salisbury, as Head Gardener to Captain W. G. BARTELOTT, Brookdean, Pulborough, Sussex.

MR. J. MILLS, formerly Floral Decorator at Underley Hall, Kirkby Lonsdale, Westmorland, as Head Gardener to Commander PHILLIPOTS, Chelston Cross, Torquay.

MR. A. PARRY, until lately Foreman at Shendish, Hemel Hempstead, as Gardener to GEO. COURTAULD, Esq., Cut Hedge, Halstead, Essex.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important to mention by Post Order that it should be filled in payable at No. 42, DURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and for a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

P. O.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from gentlemen desiring to recommend that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Royal-Balfalls, Foresters, &c. DICKSONS, Farm Nurseries, Chester, (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, Chester."

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are a position to recommend a first-rate man as HEAD GARDENER, or GARDENER and BAILIFF; also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical MEN of tested ability and first rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed situations, can be suited and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

LANDSCAPE GARDENING and ESTATE IMPROVEMENT WORKS.—Anyone requiring the services of an experienced Man to carry out Designs in connection with the above.—Apply to WILLIAM DINNES, 30, Richmond Street, Hammersmith, London, W.

To Nurserymen.

PACKER.—Age 10; over twenty years with Lombrie, Pine & Co. Good references.—**JOHN BASTIN**, Idle Road, Alphington, Exeter.

HOLLOWAY'S PILLS.—The Great Need.—The blood is the life, and on its purity our health as well as our existence depends. These Pills thoroughly cleanse the vital fluid from all contaminations, and by that means strengthen and invigorate the whole system, healthily stimulate sluggish organs, repress over-excited action, and establish the circulation and secretions throughout every part of the body. The balsamic nature of Holloway's Pills exercises marvellous power in giving tone to debilitated and nervous constitutions. These Pills remove all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons who are naturally weak, or have from some cause become so.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from a Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.
SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring, and forcing it to a small reservoir on an elevation of 255 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm and village.

This Ram works with absolutely no metal in motion.

BLAKE'S HYDRAULIC RAMS

Brunswick Nursery, Tottenham.

Expatriation of Lease. First Portion. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. John Miller to SELL by AUCTION on the Premises, The Brunswick Nursery, Tottenham, N., close to the White Hart Lane Station, G. E. R., on THURSDAY, June 26, at 12 o'clock, the erection of ten GREENHOUSES and ten PITS, with the Hot-water Piping, Bakers, and Brickwork; 120 movable Lights; also large quantity of Stove and Greenhouse Plants, Ferns, Chrysanthemums, Ampelopsis Vitis, &c.

On Wednesday Next. Ashford, Middlesex. FRUIT FAKMS, MARKET GARDENS, and ACCOMMODATION LANS, in Lots to suit Small Capitalists and Investors, the purchase money being payable by instalments extending over time years; 75 acres of important Freehold Land, having 100 PITS, with the Hot-water Piping, &c., to the main road from Ashford to Feltham; one mile distant from Ashford Station on the London and South Western Railway, and 17 miles from London, this being within easy reach of the metropolitan market. The land is situated in a popular residential locality, and the nature of the soil renders it peculiarly adapted to the Cultivation of Fruit, Flowers, and Vegetables, an industry extensively carried on in the neighbourhood. The present offer, therefore, affords an opportunity for Purchasing Small Freeholds in a proverbially healthy locality, and developing the combined advantages of residence with a lucrative, pleasant, and profitable occupation. With possession on completion of purchase.

MESSRS. HUMBERT, SON and FLINT are instructed to SELL the above by AUCTION, at the Tottenham Hall, E.C., on WEDNESDAY NEXT, June 19, 1890, at 2 o'clock precisely, in numerous Lots. Full particulars may be had of Messrs. R. S. TAYLOR, SON and H. HUMBERT, Solicitors, 1, Field Court, Gray's Inn, W.C.; at the Mart, E.C.; and of the Auctioneers, 11, Serle Street, Lincoln's Inn, W.C., and Watford, Herts.

Thursday, June 26.

ESTABLISHED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W. C., on THURSDAY, June 26, at half-past 12 o'clock precisely, a fine lot of ESTABLISHED ORCHIDS, chiefly in Flower and in bud, from various collections.

Gentlemen desiring to purchase PLANTS for this SALE will please SEND PARTICULARS NOT LATER than THURSDAY NEXT.

Thursday, June 26.

91,000 fresh SEEDS of KENTIA FORSTERIANA just received direct, in fine order. MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W. C., on THURSDAY, June 26.

On view morning of Sale, and Catalogues had.

Manchester.—Thursday, June 19.

IMPORTANT SALE of exceedingly choice ORCHIDACEOUS PLANTS, numbering 700 lots, a large portion in flower, and the whole in exceptionally fine condition, comprising Burlingtonia decorata, Bulbophyllum species, Cattleya Bawringiana, Gaskelliana, Leopoldia, Mendelia Duchess of Marlborough, Mendelia Duke of Marlborough, Schilleriana of Warriner, Crotolaria, Crotolaria, cetera, Manganiana, pandurata, and Sanderiana; Cypripedium Dayanum, grande, hirsutissimum, Lawrenceanum, Pearcei, Schroderi, seligerum majus, Seden candidulum, and Walcottii; Grammia, Grammia, and Wallisii; Lachnaceum aggregatum majus, Brymerianum, crassinode, Dearei, Falcomera, Jamesianum, Jenckensii, and Wardianum; Epiphegnum leucobulum, macrochilum, nemorosum, rhytidium, and stramineum, and Wallisii; Lachnaceum alba, aneura stella, and purpurata; Maschallia Harrimanii; Maxillaria grandiflora and venusta; Nymphaea lachnoides, and vaxillarium; Oncidium alba vidiolum, Marshallianum, nigricatum, stelligerum, sphecelatum, and varicosum; Vanda; Schomburgkia tuberosa, Trichopha species, and Vanda trees, including many grand plants and masses.

MESSRS. ARTINGSTALL and HIND beg to give notice that they have been honoured with preliminary instructions from His Grace the Duke of Marlborough, in order to offer for sale, for the purpose of removing from Blenheim Gardens, Woodstock, and SELL by AUCTION, on THURSDAY, June 19, 1890, at the Commodous Exchange Rooms, Manchester, England, the most valuable Very Choice and Rare Collection of ESTABLISHED ORCHIDS. May be viewed from 10 to 5 o'clock on the day prior to Sale. Catalogues are now ready and may be had, together with full particulars, on application, personally or by post, from the Auctioneers, 15, Princess Street, Manchester.

Cut Flowers, Plants, and Eulbs.

We hold Sales, several each week. Reference to senders of years standing. Particulars on application.

MESSRS. POPE AND SONS, Sale Rooms, 6, Philip Street, adjoining Market Hall, Birmingham.

FOR DISPOSAL, a NURSERY. A fully stocked and most desirable Nursery, in excellent order. Good reasons for selling. Immediate possession. Part of the purchase money on reman on at interest.—Apply to C. M. J. Gardiner, Clerkenwell Office, 11, Wellington Street, Strand, W.C.

TO BE SOLD, a full going JOBBING and HARDY PERENNIAL GROWERS BUSINESS, together with Stock in Trade, and other fixtures, and a large amount of Land whereon this concern is being carried, is also for Sale. Consequently a grand opportunity offers itself for one with small capital to secure a full freehold and business. Apply, W. SHERKSH, Florist, Finsley Park, Ilmpdon.

FOR SALE, a Freehold NURSERY, about 4 acres, 3 miles from London. Forcing and Greenhouses, well stocked; 6 new and Cottages, Stables, and other Buildings. Price £1500, half can remain.—T. GROVE, Hayes, Middlesex.

FOR SALE, a small NURSERY, freehold, in a growing neighbourhood. 2 good Houses, well heated; Stable, Cottage, Potting Shed, &c. Good opening for an industrious man. Apply, Mrs. G. FOSTER, 294, Peckham Rye, S.E.

TO BE DISPOSED of, an old-established FLORIST BUSINESS, with Residence and Conservatory, near Mania Vale. Moderate Rent. Possession at June Quarter. Satisfactory terms proposed for the Trade. For Cards to View, and further particulars, apply to Mr. S. BARNETT, Estate Agent and Valuer, 83, High Road, Kilburn, N.W.

ORCHARD LAND.—Full of fine Fruit Trees, in splendid condition, close to Hampton Station, containing about 4½ acres, well adapted for Market Gardeners, Florists, &c., or would make a most desirable site for Building Purposes. Price to an immediate purchaser, including all the choice Fruit Trees, £15 per acre. Large portion may remain on mortgage, if desired. The land is situated in a popular residential locality, and the nature of the soil renders it peculiarly adapted to the Cultivation of Fruit, Flowers, and Vegetables, an industry extensively carried on in the neighbourhood. The present offer, therefore, affords an opportunity for Purchasing Small Freeholds in a proverbially healthy locality, and developing the combined advantages of residence with a lucrative, pleasant, and profitable occupation. With possession on completion of purchase.

To Nurserymen and Others.

TO LET, on long Lease, a NURSERY, well situated in the best part of St. John's Wood, Good Greenhouses, Sheds, Pits, and Stabling. Apply on Premises, Waverley Nursery, near "Eyre Arms," St. John's Wood, N.W.

London, N.W.

Rare and Valuable Orchids.
MR. RICHARD PFAU has entrusted me with the sale of the following rare and valuable ORCHIDS, collected by him in Costa Rica, viz.:—
BARKERIA LINDLEYANA, or perhaps B. SPECTABILIS, nice plants with sound breaks, 8s. each.
CATLEYA DOWIANA, good plants, semi-established, 7s. 6d.; ditto, strong established plants, 15s. and 21s.
ODONTOGLOSSUM KRAMERI, according to Collector this very fine species will always remain scarce, being very rare in its native country. He says it is the fine dark variety, much superior to the lighter coloured variety from Chiriqui. Nice plants with sound breaks, 25s.; fine strong plants, 42s.
 .. **CRISTEDI MAJUS**.—This very pretty and distinct var. has larger flowers, and several flowers on a spike, much superior to type. Nice plants with sound breaks, 3s. 6d., 5s., and 7s. 6d.
ONIDIUM ANSERIFOLIUM, or now species, only a very few nice plants established here, 7s. 6d.
TRICHIPILLIA COCCINEA ATROBURBENS.—The entire lip of a deep blood-red colour, very fine var. Fine established plants, 7s. 6d. and 10s. 6d.
 .. **COCCINEA STUBBIA**.—One single plant, only found by collector, entire lip pure white, very faintly suffused with pink, a small blood-red stain deep down in the throat—very beautiful and distinct. Succeeded plants, having flowering with me, 25s.
 .. **SUAVIS SUPERBA**.—The best, highly spotted variety. Fine established plants, 10s. 6d.
TRICHOCHRYSEM PFAUAE.—A pretty winter flowerer. Small established plants, 15s. and 17s. 6d.
TRICICLARIA ENDRISI MAJOR, with flowers twice as large as the type—very fine. Sound bulbs in native soil, 7s. 6d.
 Orders will be executed in strict rotation, and forwarded, **POST AND PACKAGE FREE**, to any part of Great Britain or Continent. Terms for cash only, either by Post-office Order or Crossed Cheque, made payable to
EDWARD ORIGIES, Inspector of Botanic Gardens, Zurich, Switzerland.

BONES! BONES! BONES!

CRUSHED BONES in all sizes, for **VINE BORDERS, LAWNs, POTTING, GRASS LANDS, &C.**

"The Demon" Insecticide and Cleanser

TRADE MARK

HIGHLY CONCENTRATED—MIXES INSTANTLY WITH WATER. For use in the **Conservatory, Greenhouse, and Viney;** Flower and Kitchen Garden, the **Hop-yard, and the Orchard.**

Practically Tested by Practical Gardeners. Acknowledged to be the most Perfect Insecticide yet Invented, From Mr. R. TURVEY, Head Gardener to Sir Richard Webster, Q.C., M.P., Waterfall Gardens, Cranleigh, Surrey.—"Yours is the best Insecticide that has come under my notice; it not only destroys the 'pests', but imparts a healthy look to the plants." From Mr. F. ASH, The Gardens, Government House, R.M. College, Yorktown, Surrey.—"I am pleased to say I found your Insecticide all I could desire after a good trial; safe for the most tender foliage plants. I can confidently recommend it to anyone." From Mr. G. WILLIAMS, Nurseryman and Florist, Trumpington Road, Cambridge.—"We have given lemon insecticide a fair trial, and believe it to be the best preparation for the destruction of insects, &c., infesting plant life. We shall continue to use it, and recommend it to our friends."

All Strong and Healthy.

- GERANIUMS, from single pots, autumn-struck —
 - .. Vesuvius, Sisey, Christine, Madame Voucher, 2s. 6d. per doz., 1s. per 100.
 - .. Henry Jacoby, Happy Thought, Silver-leaf, 3s. per dozen, 1s. per 100.
 - .. Ivy-leaf, double and single, to name, sweet-scented Oak-leaf, 3s. per doz., 10s. per 100.
- VERBENAS, purple, striped, pink, crimson, scarlet, white, 1s. 9d. per doz., 12s. per 100.
- CALCEOLARIAS, Golden Gem, 2s. per doz., 15s. per 100; Amplexicaul's, name-some-lemon, 3s. per doz., 20s. per 100.
- LOBELIAS, Emperor William (the best one), from cuttings, 2s. 6d. per 100, 20s. per 1000.
- AGERATUM, dwarf blue, 3s. per doz., 35s. per 1000.
- MIMULUS, Queen's Prize, splendid mixed colours, 2s. per doz., 10s. per 100.
- PYRETHRUM, Selagenoides (new Golden Feather), 2s. per 100, 20s. per 1000.
- PETUNIAS, splendid striped and fringed, single, 5s. per 100, 40s. per 1000.
- .. beautiful double mixed, 8s. per 100, 60s. per 1000.
- HELIOTROPE, Miss Nightingale (darks), 5s. per doz., 20s. per 100.
- PINK, Mrs. Stinkins, large plants, from single pots, 3s. per doz., 25s. per 100.
- .. Phloxes Delecta, 3s. per doz., 25s. per 100.
- CLOVE, old crimson, 3s. per doz., 25s. per 100.
- CARNATION, finest, Doubles, mixed, 3s. per doz., 25s. per 100.
- DAHLIAS, Single, named, all shades of brilliant colours, from single pots, 2s. 6d. per doz., 15s. per 100.
- .. Doubles, best named, Show, Fancy and Pompones, from single pots, 2s. 6d. per doz., 15s. per 100.
- CACTUS DAHLIAS, Jaurena, Constante, Fire King, and others, 4s. per doz.
- PANSIES, Show and Fancy, splendid mixed, "from cuttings," 8s. per 100.
- PYRETHRUM (Herbaceous), Double and Single to name, from single pots, 4s. per doz.
- PHLOX, Herbaceous, mixed colours, 2s. per doz.
- PAPAVIA, Nudicaule (beautiful Iceland Poppy), white and orange, 4s. per 100, 20s. per 1000.
- .. "The Shirley," splendid showy variety, 4s. per 100, 30s. per 1000.
- ASTERS, finest German double, 3s. per 100, 20s. per 1000.
- STORKS, finest 7-week German double, 3s. per 100, 20s. per 1000.
- HELYPSIS, S.M., mixed colours, 3s. per 100, 20s. per 1000.
- MARYGOLD, dwarf French, gold striped, 3s. per 100, 20s. per 1000.
- .. African, double orange and Afric. in 3s. per 100, 20s. per 1000.
- DIANTHUS, Eastern Queen and Crimson Belle, 3s. per 100, 20s. per 1000.
- ZINNA ELEGANS, double and single, 3s. per 100, 20s. per 1000.
- CASH, Package Free. Extra plants to cover carriage.

CATALOGUE Gratis.

H. I. HARDY, F.R.H.S., STOUR VALLEY NURSERIES, BURES, SUFFOLK.

SINGLE DAHLIAS.—Clearance Sale.—
 Fine strong plants for immediate planting out. A beautiful variety of splendid colours. Will produce a grand show in the garden till late in autumn. First-class for cut flowers. 1s. 6d. doz., 10s. doz., carriage free for cash.
DANIELS BROS., Town Close Nurseries, Norwich.

NEW IVY-LEAVED PELARGONIUMS.
 A magnificent new double-flowered varieties of the most charming and beautiful colours. Splendid for hanging baskets, or the garden. Good Plants. Correctly named. 3s. 6d. per dozen, 6 for 2s., or 2s. for 6d. Extra choice sorts, 3s. 6d. per dozen, 6 for 2s., or 2s. for 6d. Post-free for cash.
DANIELS BROS., Town Close Nurseries, Norwich.

RUCHSIAS. Clearance Sale.—A magnificent collection of superb double and single-flowered varieties, including the newest and most beautiful sorts in cultivation. Splendid for pot culture or the garden. Strong young plants, from single pots, correctly named, 2s. 6d. per dozen, 6 for 1s. 6d., or 2s. for 6d. Extra choice sorts, 3s. 6d. per dozen, 6 for 2s., or 2s. for 6d. Post-free for cash.
DANIELS BROS., Town Close Nurseries, Norwich.

CHRYSANTHEMUMS. Clearance Sale.
 A splendid collection, including all the most beautiful and popular late-flowering varieties. Splendid for pot culture. Strong well-rooted cuttings, correctly named, 1s. 6d. per dozen, 100 for 10s. 6d. Extra choice sorts, 2s. 6d. per dozen, 100 for 10s. Post-free for cash.
DANIELS BROS., Town Close Nurseries, Norwich.

CHEAP OFFER OF ORNAMENTAL TREES and SHRUBS.

EXPIRATION OF LEASE.—A Large Quantity of ORNAMENTAL TREES and SHRUBS to be SOLD CHEAP, owing to the above cause.

Full particulars on application to The Liverpool Horticultural Co. (John Cowan), Ltd., The Vineyard and Nurseries, Garston, near Liverpool.

DAFFODILS ILLUSTRATED.

(New Series.—Copyright.)

"If you want really good illustrations of best Daffodils, there are none better than what are published by Wm. Baylor Hartland of Cork. His 'Daffodils,' *Journal* for March, 1890, apart altogether from Price or Trade, I am now publishing a "Book" of 44 pages, entirely devoted to what is good among Daffodils. The Drawings—many of them Conference selections—are by my niece Gertrude Hartland, engraved by Welch of London, and finished in a most artistic manner. Post free, 1s. 6d. The key to the same—descriptive and priced—will be published in July. Trade Circulars of Market Daffodils now ready. Quotation special for quantity, and prompt July delivery guaranteed. Daffodil grounds, 10 acres.
 W.M. BAYLOR HARTLAND, Seedsmen, Ard-Cairo, Cork.

ORCHID EXHIBITION.

One of the most beautiful sights in London.

ORCHIDS.—The Orchid Exhibition at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W., now OPEN, 10 to 6 o'Clock. Admission, 2s. 6d.

ORCHIDS.—A vision of loveliness unparalleled in Europe.

ORCHIDS.—"A scene of the greatest Orchidic beauty, baffling description, and defying exaggeration."

ORCHIDS.—The Exhibition is worth going any distance to see at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

WILLIAM BULL, F.L.S.,
 Establishment for New and Rare Plants,
 536, KING'S ROAD, CHELSEA, S.W.

FERNS A SPECIALITY.

The finest, most varied, choice and interesting collection in the Trade. 1400 species and var. of stove, greenhouse and hardy Ferns. Partially Descriptive Catalogue, including comprehensive list of useful Gardening books, free on application.
ILLUSTRATED CATALOGUE (No. 21), containing 120 Illustrations and much valuable information on the cultivation of Ferns, ORNAMENTALS, and SIX-PENCE, post free.

W. & J. BIRKENHEAD,
 FERN NURSERY, SALE, MANCHESTER.

PLANTS in Pots. that can be planted all through the summer.
CLEMATIS, all hardy, in great variety.
ROSES, Tea-scented, &c.

CREEPERS for Walls. N.B.—By planting what is suitable, an ugly object may easily be made beautiful. Lists and advice free.

RICHARD SMITH & CO.,
 NURSERYMEN and SEED MERCHANTS,
 WORCESTER.

BEDDING GERANIUMS, CALCEOLARIAS, DAHLIAS, LOBELIAS, &c. Finest kinds, strong plants. New Catalogue free on application.

DICKSONS NURSERIES, CHESTER.
 (Limited.)

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.
 Too well known to require description. Price 6s. per bushel (25s. extra per bushel for packages), or 6d. per cake; free by parcel post, 1s.
 None genuine unless in sealed packages and printed cultural directions enclosed with our signature attached.
WM. CUTBUSH and SON, Nurserymen and Seed Merchants, Highgate Nurseries, N.

NOTES FROM MEXICO.

As a recent stay of some three months in the northern and less frequented parts of Mexico afforded me an opportunity of studying the climatal conditions of that region, and to a small extent the flora, a *résumé* of my notes may not be devoid of interest. During February, March, and April, my business occasioned a considerable amount of rough travelling, ranging from Nogales, a small Mexico-American town on the frontier between Arizona and Sonora, Hermosillo, the present capital of Sonora, some 170 miles to the south, and Arispe, the former but now abandoned capital, about 70 miles to the east. This last-named city is quite discovered from general commercial activity by the absence of all railway connection, or any roads better than hill trails and river beds. Nogales stands at 4000 feet above the sea-level, and is situated amid countless low, rounded hills, resembling in their parched and stony character nothing so much as heaps of reddish road metal. At varying distances towards all points of the compass, bare and equally arid-looking precipitous mountains of some 2000 or 3000 feet additional elevation bound the view, and at that season (January) occasionally showed a little snow. There are generally two rainy seasons here—one setting in about the end of June and continuing into August, the other beginning in November and lasting until January. In the intervals, little or no rain falls, and all the smaller water-courses run dry. I was too late for the winter spell of rain, but was so close upon the heels of it that I was detained for some time at Nogales through the River Sonora being in flood, and the consequent impossibility of travelling through the district it traversed, the river bed being the only road. Incidentally I may mention, that a trip of 70 miles necessitated 156 fordings, many of which, owing to shifting quicksands, were very ticklish passages.

At Nogales my enforced stay gave me a capital opportunity for exploration, and I was speedily very much struck by the fact that not only were numerous species of the drought-loving family of the Cacti associated intimately in the shallow rocky cañons between the hills with the moisture-seeking tribe of Ferns, but that the various species of both were growing vigorously and quite uninjured in a temperature which produced icicles fully 5 feet long upon the tank at the railway depot close by, and permitted snow, in sheltered spots, to lie in actual contact with the plants for days together. The air, immediately the sun set, became intensely cold, due to the elevation and brilliant clearness of the atmosphere. I was informed, and have no reason to doubt it, that over 20° of frost were registered one night during my stay, while the heat of the sun during the day burnt the skin off my face. The Ferns I found here were *Nothochlana rufa*, *N. dealbata*, *N. Newberyi*, *N. sinuata*, *Gymnogramma hispida*, *Pteris ternifolia*, *P. ornithopus* var. *brachyptera*, *Pellaea marginata*, *P. pulchella*, *Cheilanthes elegans*, and *C. Eatonii* (?), to which I added later a species of *Lastrea* much resembling *L. nova-boracensis*, an *Aemia*, and a seedling *Adiantum* very like at that stage *A. capillus veneris*, but too young to discriminate with certainty.

All the Ferns I have specifically named are cultivated in this country as greenhouse species, but it is quite obvious from the above facts that, given a dry atmosphere, and the vigour of constitution engendered by exposure, they can stand a considerable amount of frost with impunity. The same remark applies to the Cacti with which they were associated, the species of which, however, were not numerous, though the apparently barren hills, on closer acquaintance, revealed a great number of plants, chiefly *Mammillaria*, one species of which formed large heaps of ten or a dozen finely corrugated balls, greyish-white, with innumerable thorns, and 5 or 6 inches in diameter. These flower in April, and produce a ring or corona of pink, or, in some cases, primrose-coloured blossoms, round the upper portion of each ball, the whole clump presenting a most charming appearance. Here and there were two varieties of *Opuntia*—one with very long thorns, dark green leaves, and decumbent habit; the other erect, with light glaucous green and apparently almost thornless leaves; but we betide the incautious handler, for it is not the obvious thorns which are to be feared, but the insidious minute ones, which cover the warty projections from which the former spring, and which detach themselves immediately they touch the skin, and only make their presence known later, when they have been accidentally rubbed in, and produce intense irritation; sharp eyes and a pair of tweezers being the only remedy.

Associated with the Cacti on the hillsides are several species of *Yucca* and *Agave*; one of the latter, locally termed the Mescal plant, forms huge Pine-apple-like basal masses, from which the thick fleshy leaves spring. These pseudo Pine-apples are the source of the potent native spirit Mescal, which resembles pure water in appearance, but by no means in taste or effect. In crossing the country, trains of donkeys are frequently met with laden with these roots, denuded of their leaves, which they are carrying to the various Mescal ranches or rude native stills which are scattered about the locality.

Trees are fairly plentiful along the wide torrential watercourses, or "arroyos" above Nogales. Walnut trees especially, whence the name of the place (Nogale, Walnut tree). Upon these a species of *Mistletoe* grows, not very unlike ours, but with shorter leaves. Later on in my travels I found the Mesquite (*Acacia*) trees laden with two very different species, in which the leaves were almost entirely aborted, the plants consisting of long pendulous stalks bearing the blossoms. From the way the two

were associated, I suspected the two apparent species to consist of separate sexes of one, but circumstances prevented me from verifying this, and promised specimens were not obtained for me. The natives asserted that the leaves, *i.e.*, stalks, if collected, dried, and smoked as cigarettes, were a powerful remedy for coughs, so powerful indeed that a whiff or two sufficed to give relief. These Mesquite trees, with hard red wood, and Black Oaks, together with the Walnut trees aforesaid, form the chief timber of that district. The natives are very impatient. To light a fire at the base of a fine tree, and return eventually to gather the *debris*, being their common mode of procedure, on their own account, though under a contract they are adepts with the axe.

The entire absence of timber proper on the hills, and the torrential character of the rains, amply account for the absolutely soilless condition of the surface, which consists entirely of smaller or larger stones, the arroyos or watercourses being often wide channels of sand and boulders, affording ample evidence of furious streams in the rainy season, though in the dry, even the rivers occupy but a streak of the available channel, and the minor streams disappear altogether.

Leaving Nogales, I next proceeded to Hermosillo, some 170 miles to the south, and lying at a considerably lower elevation—about 1000 feet above the sea. Here it was intensely hot in the first week in February. The railway thither from Nogales runs for the greater part of the way through a wide flat plain, covered with Cacti, the species, size, and variety increasing gradually as we proceeded and descended, until, at length, they assumed all the varying types of tree, shrub, bramble, and creeping weed, the genus *Cereus* especially doing its best to ape them all, *C. candicans* throwing up in all directions its tall bunches of huge Cucumber-like branches, full 20 feet high, while other members of the family formed tangled masses of interminable snake-like undergrowth, like Brambles, and the ground generally was dotted over with diminutive members of this and other species, round, oval, and sausage-shaped. A more curious or decided contrast to the vegetation of our open lands in England could hardly be conceived.

Just before reaching Hermosillo, the plain suddenly narrows, and the boundary hills are then seen to be literally bristling with enormous specimens of *C. candicans*, mixed now with *Opuntias* and various members of the *Yucca* and *Agave* genera, resembling bunches of bayonets radiating ferociously in all directions. Another minute or two and—*Hey! presto!*—all is changed. Tall *Palms* in clumps, heavily-laden Orange trees, sweet and sour, forming now the salient features of a quite tropical outlook, and showing where cultivation has made its mark; while over the hedges, which are choked with large Bamboos and Castor-oil plants, we catch glimpses of the densest and greenest conceivable crops of corn. The immediate proximity of the Sonora River, and the consequent facilities for irrigation, lie literally at the root of this change, which is very striking, half a mile sufficing to alter the vegetation from the most arid types to those of a quite opposite nature. My journey thence took me right up the Sonora River to the city of Arispe, through an ever-changing panorama of rugged mountain scenery of the most interesting character, both geologically and botanically, the dryness of the climate affecting both features very markedly. All along the route the rocky boulder-strewn hill and mountain sides, literally bristle with *Cereus candicans*, called by the natives *Pitayos*, which, anchored in chinks and crevices at all angles, shoots out its huge Cucumber-like limbs in bunches of a score or more, and as many feet long. *Cereus giganteus* I did not meet with here; but in one spot, about 30 miles from Nogales, I came across about thirty or forty huge specimens, all located upon one hillside, and averaging probably about 30 feet high. These are called *Saguaros* by the natives. These differ from *C. candicans* by springing singly from the rocks, and branching sparsely and much later.

It was early in the year for flowers, but towards the end of my stay, many very beautiful things were in bloom; among them were three species of *Eriothera*, one with pale yellow blossoms, so like our common Primrose, that for some time while passing it in the early morning on horseback it deceived me; another had somewhat larger white flowers, and finally *E. taraxacifolia* with its splendid large white blooms in masses a foot or more across, became very conspicuous all over the country as soon as the sun went down. As all these three species had Dandelion-like leaves, the name given to the largest loses distinctive value. *Eschscholtzia californica* took the place of our Buttercup. Wild Tobacco is a weed everywhere, even in the streets of Arispe. This city, which consists now mainly of the *debris* of adobe (sun-dried bricks) buildings, whole streets having perhaps only one or two habitable dwellings, is built mainly on a bed of lava, and the country at the back of it consists of a series of low table-lands, called *mesas*, cut up into watercourses, all dry when I was there. These *mesas* form the habitat of countless formidable Cacti, *Opuntia echinocarpus*, bristling with long white thorns, which the miners in the locality seriously declared to me they were capable of projecting for some distance at passers-by. As usual, however, when this was disproved by experiment, the report was deftly shifted to a different species in another region. Anyhow they are "kittlecatle" to meddle with, the smaller thorns existing in myriads, while the larger are so acute and strong as easily to penetrate stout leather boots. These plants form numberless spherical bushes about 3 or 4 feet high, and 2 feet through, on trunks about a foot in height. Strange to say, although it would be extremely difficult and dangerous to insert a well-gloved hand into the mass of branches, I repeatedly saw birds' nests in the very centre, and birds flying in and out with impunity. The joints of the short segments of which these branches are formed are extremely brittle, and a blow with a stick strews the ground with fragments. These speedily root where they lie, and thus serve to propagate the plant, independently of the Pear-shaped fruits, which also are found rooting in the same fashion, and throwing up small plants by budding independently of the contained seed.

In the orchards about the city a large species of the ordinary *Opuntia*, *i.e.*, with pear-shaped joints to its stem, is cultivated for its fruits, and grows to a fair-sized tree, with joints a foot or more in length, but with smaller blossoms than some of the wild kinds. Each of the decayed joints contains several flat hard woody network-like plates of a very beautiful pattern, which it occurred to me might well be utilised for cabinet work. Pomegranates and Oranges are associated with these. Wild Grapes are common, but I had no opportunity of judging of the merits of their fruit.

Early in April the Cacti were blossoming, also some of the *Yuccas*. A wild *Opuntia* bush, covered densely with huge primrose-coloured flowers, was a sight worth seeing, and only ranks second in my memory to a *Yucca*, about 4 feet high and two feet through, which I came across in a rocky cañon, and bore a solid looking mass of hundreds of pure white Lily-like blooms, some four or five huge spikes being bunched together. It was so brilliantly white that my horse shied at it, and I tried in vain to get a close view.

On the hillsides, up the Sonora River, half-way between Hermosillo and Arispe, and at some 2500 feet elevation, I remarked a considerable number of curiously deformed trees scattered about among the clumps of *Cereus*. The upper branches were all bent down and distorted, and on examination and inquiry I found they had all been killed down about half-way by an exceptionally severe frost the previous winter. No signs of damage to the Cacti were visible; hence, *C. candicans*, though absent at 4000 feet, must be able to stand some amount of frost. The native name of the tree is Palo Blanco, or the white stick, its bark being quite white. I also saw a few flowers of a pure waxy-white, about the

size of half-a-crown. The species is unknown to me. I observed slight white frost in this district as late as March.

On my return journey through Texas, I noticed children at the railway depôts selling baskets of Echinocacti and other species, and specimens of the Resurrection plant (*Selaginella lepidophylla*), which they collect on the adjoining prairie and sell for a few cents per basketful. A specimen of the *Selaginella*, dry and shrivelled when bought, after three weeks' sojourn in my portmanteau, became a beautifully fresh and vigorously growing rosette of true *Selaginella* type within twelve hours of its immersion in water. Here, however, Mexico was behind me, and so I close my notes. *Chas. T. Drury, F.L.S.*

ORCHID NOTES AND GLEANINGS.

CATASETUM BUNGEROTHI.

In reference to the proposal to change the name of *C. Bungeorothi* for that of *C. pileatum*, against which Mr. Linden has entered a protest on p. 618 of this volume, I may be permitted to say a few words, as I think the whole evidence in favour of the change is of a very unsatisfactory nature. About the time when I described *C. Bungeorothi*, the late Professor Reichenbach was at Kew, but I do not quite remember if I had actually sent my description to Mr. Linden, or was then preparing it, but I believe I had just dispatched it. I do, however, most clearly remember talking to Reichenbach about the plant, and showed him either Bungeorothi's drawing, or a tracing from it, and asked his opinion of the plant, which was that he had never seen anything like it.

A few weeks after the publication of *C. Bungeorothi*, Reichenbach published his second description of *C. pileatum*, without any reference to his previous description of it, or to *C. Bungeorothi*.

Now I submit that when he published this second account of *C. pileatum*, he must have known if it bore any resemblance to the drawing of *C. Bungeorothi*, which, although a poor one, is sufficiently good to make the plant unmistakable, especially as I had a short time previously brought the drawing prominently before his notice. Yet, not only does he make no allusion to it then, but afterwards, when the plant became well known, he never published any statement to the effect that the name *C. pileatum* belonged to it. And those who were best acquainted with Reichenbach, will, I think, for the most part agree with me that he would not be likely to let another name take precedence over one of his own if he could clearly show that they were synonyms, which he could most easily have done in this case if they are so. The only evidence we at present have that *C. pileatum* is the same as *C. Bungeorothi*, rests upon the statement made by Reichenbach, in two private letters. I am far from saying that his statement is not true, but, until it can be verified, I think it should be received with some caution.

In the original description, *C. pileatum* is compared to *C. cernuum* and *C. naso*, both of which are quite unlike *C. Bungeorothi*; added to this, we have the testimony of Mr. Linden, father and son, that they do not remember sending any flower like that of *C. Bungeorothi* to Reichenbach; and M. Linden further writes to me that they had no collector in Venezuela at that time; there is also his statement to myself that he had never seen anything like it, and Reichenbach's memory was of such a wonderfully tenacious order, that it seems incredible he should have described a flower (evidently from fresh, although slightly withered material) of such a remarkable species as *C. Bungeorothi*, and then fail to recognise it from the drawing. All this appears to me to tell against the probability of *C. pileatum* being the same as *C. Bungeorothi*; had it been certain, his public silence on the point appears incomprehensible. But as the matter can neither be proved or disproved until another twenty-four years have passed, and there is certainly some element of doubt about it, I think it better to retain the name of *C. Bungeorothi* for the plant, until it is clearly shown to be identical with *C. pileatum*. *N. F. Brown, Herbarium, Kew.*

NEW OR NOTEWORTHY PLANTS.

CATLEYA LABIATA, Lindl., var. WAROCQUEANA, n. var. (?)

At the meeting of the Royal Horticultural Society held on May 13 last, a newly imported *Catleya* was exhibited by M. Lucien Linden, of Brussels, under the provisional name of *C. Waroqueeana*; but as the flowers had only expanded on the journey from Belgium, and, moreover, the plant, not being yet established, it was hardly in a condition to pass an opinion upon it. Botanically it is a form of *C. labiata*, using that term in its broadest sense, but the exact relation it bears to the other existing forms is a difficult matter to decide. It is said to be from a part of South America previously unexplored, though what part it may be I have not the slightest suspicion. M. Bungeoroth, of Catastium fame, is the collector, and expresses the opinion that it represents a new and distinct form of great beauty, and, he having travelled much in the Mossia, Mendeli, and Triane districts, ought to be in a position to judge. The materials now sent by M. Lucien Linden are ample, and consist of two (wild) dried flowers, a photograph of the flowering plant, five coloured drawings, a fine-flowered raceme of living flowers, and a living plant bearing a three-flowered raceme, the latter being kindly presented to the Kew collection. These materials show a rather wide range of variation, and M. Bungeoroth speaks of a dozen well-marked varieties, one of which is white. The wild dried flowers are 6½ inches across, and bear much resemblance to the original *C. labiata*, the sepals and petals being of a rosy-mauve shade, the front lobe of the lip crimson-purple, behind which is a well-defined deep yellow area, which extends along the disc, and the side lobes are rosy-mauve. Two of the coloured figures are very similar, but with the undulating margin of the lip much paler. A third has the same part very deeply coloured, without the pale margin and yellow disc. A fourth has the yellow disc well developed, with a very small crimson-purple blotch, the rest of the lip being of a much lighter shade. The fifth form is almost white, except the small purple blotch and very small yellow disc. The Kew plant had a three-flowered raceme, in which the veining of the lip strongly recalled the form *choicoensis*, though in other respects much deeper in colour; it was also a little fragrant; the five-flowered raceme is darker in colour, and quite without the yellow disc. Lastly, the photograph shows a four-flowered raceme, with the lip beautifully undulate. The flowers produced after importation are far smaller than the dried ones, showing the exhausting effect of a long journey. Such is the character of this variable but beautiful plant, which may be provisionally named as above, in honour of Mr. G. Waroqué, President of the Orchidocène of Brussels, and one of the administrators of the Horticulture Internationale of the same place. The relation it bears to other forms of *C. labiata* is the more difficult to determine, because of information as to its habitat, and must be left until the plant becomes fully established. *R. A. Rolfe, Herbarium, Kew.*

POTATO EXPERIMENTS, 1889.

A most interesting and useful series of experiments on the growth of the Potato have for some years been in progress at the Agricultural Experiment Station, at Kentucky; the results of the 1889 investigations having recently been published in *Bulletin*, No. 22, may conveniently be considered under the following heads:—

1. Test of Varieties.
2. Methods of Planting.
3. Preparation of Seed.
4. Testing the Effect of Fertilisers.

The conclusion arrived at from the year's trials are thus briefly summarised:—

1. Many new varieties produced a larger yield than either the Early Rose or Burbank. Notably among the large yielders may be named the Irish Wonder, producing 389 bushels per acre; General Logan, 286; Lombard, 281; American Magnum Bonum, 280; while the Burbank and Early Rose produced respectively 209 and 184 bushels per acre.

2. The trench system of planting produced no marked effect as to the yield over the usual method of planting.

The yield was greater in forty-eight out of fifty-five trials, when Potatoes were planted 14 inches apart in the row than when planted 20 inches. On the contrary, the proportion of large to small Potatoes was in favour of the 20-inch planting.

3. Planting large whole Potatoes largely increased the yield over planting Potatoes cut to two eyes, or cut in two, or small whole Potatoes.

The yield was in proportion to the weight of seed-tubers planted.

4. The yield of Potatoes was largely increased by the use of fertilisers containing potash. Where fertilisers containing no potash were used, a less increased yield was obtained.

5. A profit was obtained by applying potash manures, or fertilisers in which potash was one of the ingredients.

The following explanation and discussion of the experiments may prove of service.

TEST OF VARIETIES.

The soil of the experimental station farm on which all the investigations are made, is what is called a "Blue-grass" soil. It is derived from the limestones of the Trenton group of the Lower Silurian. These limestones in general are rich in phosphoric acid. The subsoil is a light-coloured clay, not easily permeable by water, and therefore the ground is generally wet and cold in the early spring.

Cotton-seed hull ashes containing 32.66 per cent. of potash, at the rate of 400 lb. per acre, were applied to each plot in the row, and well mixed by the use of a hoe before the Potatoes were planted.

For seed, medium sized to large Potatoes were cut in pieces as nearly of equal size as possible, and containing from two to three eyes each. These were planted cut side down, one half of each plot 14 inches apart, and the other half 20 inches, in rows 3 feet wide.

All the varieties were planted April 6, and covered to a depth of about 4 inches. At the third cultivation they were earthed up.

The following table shows the yield of those varieties giving a total of over 200 bushels, equal to 5 tons per acre. The Potatoes were planted 14 inches apart in the row:—

No.	Name of Variety.	Bushels per Acre.		
		Market-able.	Small.	Total.
1	Irish Wonder	211	178	389
2	General Logan	245	51	296
3	Lombard	193	88	281
4	American Magnum Bonum	237	43	280
5	Nevada Red	211	64	275
6	Nevada White	208	64	272
7	Yellow Elephant	193	71	264
8	Alexander's Prolific	179	64	243
9	Burpee's Superior	202	40	242
10	Wells's Jumbo	208	32	240
11	Governor Cleveland	192	48	240
12	Summit	169	67	237
13	Salt Lake Queen	184	49	234
14	Cayuga	188	31	219
15	Silver Skin	171	48	219
16	Charter Oak	174	44	218
17	Brownell's No. 31	171	45	216
18	White Beauty of Helron	168	48	214
19	Burbank	157	52	209
20	American Giant	178	32	208
21	McFadden's Earliest	160	45	205
22	White Elephant	149	53	202

The foregoing results show that the Irish Wonder exceeds all others in total yield, but two others exceed it in quantity of marketable Potatoes. In studying these results, the fact should not be overlooked, that a variety, showing a greater or less yield than some other in any one year, is not conclusive proof that it will do so year after year.

QUALITY OF THE DIFFERENT VARIETIES.

While the yield should have its influence, the quality must have due consideration in the selection of Potatoes. A good yielder may be worthless on account of its poor quality. The quality of a Potato is supposed to depend on the amount of starch it contains, or, as the dry matter is mostly starch, it is often taken as a standard by which to judge the quality. The size of a Potato has also its influence. A good Potato should contain from 23 to 25 per cent. of dry substance, or, in other words, should not contain over 77 per cent. of water.

In a comparative trial which was made, the following is the order of quality, showing the first ten in order from the twenty-two varieties given in the foregoing table of produce:—Nos. 8, 17, 7, 9, 22, 21, 12, 4, 11, and 3; that is to say, No. 8, Alexander's Prolific, was the best as to order of quality; and No. 17, Brownell's, second in order, and so on.

PREPARATION OF SEED.

Five plots of ground were used in these experiments. They were each one-eighth of an acre in size, and in the same field adjacent to the plots on which the varieties grew. They received the same treatment as to manure and cultivation as the varieties. Northern-grown Early Rose was the variety used. In all the plots the Potatoes were planted 14 inches apart, and in rows 3 feet wide.

On plot 1 were planted selected large Potatoes cut to two eyes; No. 2 same, cut in two; No. 3, selected large Potatoes, planted whole; No. 4, small Potatoes, planted whole; No. 5, medium Potatoes, cut to two eyes.

The following table shows the yield of Potatoes under the different methods of seeding in quantities per acre:—

Plot.	Form Planted.	Bushels per Acre.			Amount Planted in Bushels.
		Marketable.	Small.	Total.	
1	Large, cut to two eyes ...	133	51	184	8
2	Large, cut in two	278	24
3	Whole (large) ...	213	131	344	48
4	Small (whole) ...	173	99	272	17
5	Medium two eyes ...	128	59	187	6

These results show that by planting large whole Potatoes there was an increased yield over the usual method of planting of nearly 100 bushels per acre of merchantable Potatoes. This is stated to be the third trial, and each time the result has been the same, that is, by planting large whole Potatoes, instead of cut tubers, there follows an increased yield in the crop.

This is further substantiated by comparing results obtained by many similar experiments throughout the country, although it does not agree with experiments made in Germany and elsewhere.

Whether it will pay to plant large whole Potatoes, rather than medium or cut tubers, depends largely upon the season and the price of seed Potatoes, as well as the price of the harvested crop.

EFFECT OF FERTILISERS ON POTATOS.

The field on which these experiments were made is quite level, the plots being each one-twentieth of an acre in size, and separated from each other by paths 3 feet wide.

The variety of Potatoes planted was northern-grown Early Rose, of large size, each Potato being cut in two and planted cut-side down, 14 inches apart in the row; rows 3 feet wide. Manures sown and Potatoes planted April 5, 1889.

The following Table gives the amount of different

manures applied per acre, the yield of Potatoes, and the order of quality:—

Plot.	Fertiliser used.	Amount per acre.	Quality of Potatoes.	Yield per acre.		
				Marketable.	Small.	Total.
1	Without manure	6	59	56	115
2	Nitrate of soda ...	160	8	43	61	104
3	Acid phosphate ...	400	4	31	53	87
4	Sulphate potash ...	160	1	17	21	38
6	Nitrate of soda ...	160	7	93	62	151
	Acid phosphate ...	400				
7	Nitrate of soda ...	160	3	27	41	68
	Sulphate potash ...	160				
8	Acid phosphate ...	190	3	243	44	287
	Sulphate potash ...	160				
9	Acid phosphate ...	190	5	172	47	219
	Sulphate potash ...	160				
10	Nitrate of soda ...	160	2	81	52	136
	Gypsum ...	180				

The results show that the yield of Potatoes was largely increased by the use of sulphate of potash, either when used alone or in combination with nitrate of soda, or acid phosphate, or both. It appears that neither acid phosphate or nitrate of soda, when used separately or in combination with each other were of much benefit, but that when either was used with sulphate of potash the results were beneficial as to yield, the greatest yield being produced when both were applied together with potash. The tubers on the plots receiving potash were noticed to be smoother, larger, and more even in size. It is further shown in the foregoing table that the quality of the Potatoes was the best with sulphate of potash alone, second best with gypsum, and third best when potash formed one of the constituents of the manural application. *J. J. Willis, Harpenden.*

PEONIES.

A VISIT to any well-found garden would reveal the fact that the Peony is the flower of this particular period of the year, a position which it shares with the Irises of the germanica, squelens, and pallida groups, wedged in, as it were, between the last of the great family of the Daffodils and the Roses. Without the Peonies the garden in early June would be sadly deficient in bold floral forms, gorgeous colouring, and some fragrance, for some Peonies—notably *P. Broteri*, a single, crimson flower, is fragrant.

The glowing colours of Peonies, their great variety, especially of single-flowered varieties, of which Messrs. Kelway & Son, Langport, Somersetshire, are now the great-st raisers in this country, were to be seen to great advantage at the meeting of the Royal Horticultural Society, at the Drill Hall, James Street, on Tuesday last.

On the same occasion the history of the flower in this country, and to some extent, on the Continent, was most interestingly discoursed on by Mr. George Paul, and scientifically treated by Mr. R. Irwin Lynch, of Cambridge Botanic Garden. The first-named gentleman mentioned amongst the foremost hybridisers and collectors of the Peony in our country, Parker of Tooting, and the elder Salter of the Versailles Nursery, Hammersmith—long since covered with houses; and the Osbornes, of Fulham; and abroad, Keteleer, the Van Houttes, and Van Geert. The greatest activity was experienced early in the fifties, Mr. Paul recollecting that the trade in Peonies was then so great, that orders remained unexecuted from deficiency of plants.

Doubtless, many thousands of these but poorly-established plants perished from want of due care in the first winter, and from improper planting, or want of due preparation of the soil. Despite these almost inevitable losses, the Peonies may still be found in

honoured places in numerous gardens throughout the length and breadth of the country.

Soon afterwards, the fashion of employing immense quantities of half-hardy and tender plants in the decoration of the flower garden led to the general retirement of this plant, and many another as good to the shrubbery border, the reserve garden, the woodland walk, and in many instances, we fear, to the rubbish-heap. But the horticultural dial has gone backwards of late years, and we gladly welcome the return to a more natural style in decorative gardening, in which these and other hardy herbaceous perennials can find a place.

In Mr. Paul's remarks on the culture of the herbaceous Peony, and his paper mainly treated of these species, the following practical instructions as to planting were given:—'The land should be deep naturally, or be made so by trenching it, or taking out spacious holes; plenty of rotten manure should be dug into the soil, and if some good loam could be added to the staple it would be of benefit to the plants. In fact, all the preparations should be those required by a plant that would occupy a certain station for a number of years without removal. Planting is best done between the months of November and February, and small plants are better than large ones. Before being planted, all the old soil should be washed clean off the roots. The depth at which the roots should be planted is 3 inches below the surface, and planting should always be followed by a mulching of half-rotten dung, thick enough to keep frost from the roots.' We would add that mulchings are desirable in after years, not so much to ward off frost—for the roots, when established, are not liable to injury in that way—but as a stimulus to growth; and more so is this much required when the plants are in outlying positions in the pleasure grounds, or in borders of shrubs.

We reproduce in our illustration (fig. 122) forms of single Peonies. That seen at the upper part of the illustration is *P. corallina*, a crimson flower, and foliage more divided than in *P. officinalis*. It has become naturalised on an island in the Severn. The flower in front is *P. albiflora*, a species bearing branched flower-stalks, and flowers either rose-coloured or white. There are many varieties of this native of China in our gardens showing a wide range of colour, and blooming at a rather later part of the season.

We reproduce in fig. 123, *P. corallina*, to show habit and foliage. Mr. Lynch's paper, dealing chiefly with the classification of Peonies by means of their leaves and carpels, was necessarily of considerable length. He is, perhaps, the best authority on the subject existing, and his rather abstruse discourse was of such a nature that he was able to obtain close attention from his audience from the beginning to the close.

HEREDITY.

THERE are two rival hypotheses which claim to explain the phenomena of heredity. Darwin [*Provisional Hypothesis of Pangenesis*], supposes that every cell in any living thing throws off infinitesimally small gemmules, which mingle in its fluids. Eventually the germ-cells of the reproductive organs will contain gemmules of all parts of the body, and so from the pollen-grain and ovule the features of the parents are reproduced. Thus, the parental features are reproduced not only through the seed, but owing to these microscopic gemmules floating in the juices of a plant, the parental features can also be reproduced from almost any part of a plant—leaf, stem, root—by what are called buds.

It happens that all the features are not reproduced in all the generations. Certain features in some generations are suppressed, but reappear in some subsequent generation. This Darwin explains by some of the gemmules remaining dormant, but retaining the power of growth in some other generation, when circumstances are more favourable for their development. This phenomenon of re-

FIG. 122.—SINGLE FLOWERED PEONIES. (SEE P. 796.)

appearance of certain ancestral features is commonly called reversion.

Weismann's theory, if I understand it rightly, supposes that in the beginning of time living things consisted only of protozoa and protophyta, that is, unicellular animals and plants floating about in water, like microscopic soap-bubbles. That these reproduced themselves by subdivision. In their unicellular state they were influenced by surrounding conditions, and therefore gave rise to varieties. These varieties, by subdivision, reproduced a number of similar varieties. Every cell, it must be understood, was reproductive organ and body, or "soma," in one.

In the process of evolution, however, and by imperfect subdivision, a number of unicellular cells became clustered together, first in small numbers, and then in larger numbers. Such compound bodies are technically called metazoa and metaphyta, that is, multicellular animals and plants. We can form a better conception of these clusters by blowing through a tube into a solution of soap. On the surface a froth or cluster of bubbles will be formed.

Presumably, every cell of a compound body was originally a reproductive organ. This, however, must have been a cumbersome and inconvenient arrangement in the struggle for life. Fancy a bunch of reproductive organs multiplying by subdivision and clinging together! It is clear that if a division of labour were to occur, it would be beneficial to the whole cluster. Some of the cells would remain procreative organs, while others would turn into simple vegetative organs, that is, feeders and protectors, not only of themselves, but also of the procreative cells. Thus it is supposed the foundation was laid of all animals and plants as we see them today, viz., a body which corresponds with its surroundings, and which gives cover to an organ of procreation. The reader must not of course be very particular about time, such things are measured by the clock of the universe, in which a hundred million years are as nothing.

Now Weismann explains heredity by the subdivision of those primordial-cells which have continued as reproductive cells, containing germ-plasm. It is clear, according to his theory, that the modern germ-cell, whether of animal or plant, is only a piece of that unicellular creature which lived, it may be, hundreds of millions of years ago.

He does not admit that the somatic or body-cells have any influence in varying the generative cells, and therefore acquired habits of the body cannot be transmitted to future generations. The only variations he admits in the offspring are congenital, or such as are brought about by the mixture of the contents of the male and female reproductive cells. Therefore, the splitting up of the sexes in separate individuals, each having a long and distinct line of ancestors behind it, is conducive to variation in the offspring, which variation is laid hold of by natural selection, and worked up into species, genera, &c.

That part of Weismann's theory, which supposes the germ-plasm of to-day to be a piece of the germ-plasm of unicellular bodies in the beginning of time, and its variation by marriage of male and female germ-cells appears satisfactory; but the other part of his theory, viz., that the body or somatic cells have no influence in producing variations in the offspring is hardly believable. He says that the only office of these somatic cells is that of nourishing and protecting the germ-cells, or reproductive cells.

Supposing that all living things were originally unicellular, we must suppose that both germ-cells and somatic cells must have originally been germ-cells. These he admits were influenced by their surroundings. Then, by what manner of reasoning does he exclude the influence of surroundings now that it is the somatic cells, which constitute the surroundings of the germ-cells? Either there is a flaw in Weismann's chain of reasoning, or the modern surroundings of the germ-cells—the body—still continue to influence the germ or reproductive cells, in however small a degree.

Be all this as it may, the object of my putting

these rival theories before the reader is to suggest, by the help of Weismann's theory, what may be a new idea.

According to Weismann, both germ-cells and body-cells were originally germ-cells, the body-cells being germ-cells turned to another purpose. In other words, they are abortive germ cells, which, in the course of the struggle for life of the individual, have been utilised for various purposes. These abortive germ-cells are now the various tissues of plants and animals. If so, we may have here a possible solution of the pangensis puzzle. The lizard can remake its tail, a bit of leaf of certain plants can bud out the whole plant—reproductive cells and all. The pangensis theory explains this by germs of all kinds of tissues circulating in the fluids of living things, and the capable of reproducing the features of the parents.

By the help of Professor Weismann's theory, all this can, I think, be otherwise explained. The somatic, or body-cells, are nothing but abortive germ-cells turned to other purposes. Therefore, under certain circumstances and stimuli these originally germ-cells, but provisionally abortive or tissue-cells, may again be roused from their abortive tissue state to their active germ-cell state, and by reversion made to reproduce the whole parent form again.

Of this sort of reversion we have innumerable instances in plant-life. In the Begonia not only a bit of leaf can reproduce the parent plant, but even a hair of the epidermis can do so in Begonia phyllomanica. Thus, by the help of Weismann's theory, the phenomena we see would admit of more reasonable explanation than by the theory of pangensis.

Then, to understand the ease with which the somatic-cells, influenced by their surroundings, could in turn influence the germ-plasm, as its surroundings, it is sufficient to have heard Lord Rayleigh's lectures on electricity at the Royal Institution. One becomes impressed with the facility with which bodies can become polar. He took an iron bar, which was not magnetic. This he ascertained by trial with the galvanometer. He then held it in a certain position with reference to the earth's magnetism, and simply gave the bar a few taps. By re-trying it with the galvanometer, he found it had become magnetic. The slight vibrations produced by the tapping were sufficient, under the influence of the earth's magnetism, to make the molecules of the bar polar. Every function in the body of animals is under the influence of the nervous electricity. In plants it has not been ascertained that there is any tissue analogous to the nerve-tissue of animals, yet their cells are eminently sensitive to heat, light, and, presumably, to electro-magnetic disturbances.

How these subtle influences can be prevented from first influencing the body-cells, and through them the germ-plasm of the reproductive cells, we have yet to learn. If there is any function more influenced than another by changes, it is the reproductive function. By simple change of surroundings, both animals and plants, although apparently perfectly healthy, often refuse to breed. This being so, even if we exclude the intervention of the body-cells, we must admit the direct influence of surroundings on the germ-plasm.

However impossible it may be to believe that the body-cells have no influence on the germ-plasm, I believe that by the help of Weismann's theory, we can explain the budding of the whole of the parental features from almost any part of certain plants. The somatic cells, though abortive germ-cells, are nevertheless in certain plants also potential germ-cells. In these plants either all the tissue-cells are potential germ-cells, or dormant germ-cells are scattered about among the abortive ones. Which of these it is will have to be left a good deal to the imagination.

The difference between Darwin's pangensis and Weismann's pangensis would be, that the former supposes infinitesimally minute germ-cells circulating in the fluids, while the latter would suppose every cell either actually or potentially filled with the germs of the future being. *E. Bonavia, M.D.*

RAILWAY RATES.

Almost before the majority of the trade has fully realised the enormous interests which are involved in this matter, the Board of Trade Inquiry has concluded its sittings. We do not wish to infer that the inquiry has been a hurried one, nor that all matters brought before Lord Balfour of Burleigh and Mr. Courtenay Boyle have not received from them that patient consideration which their importance deserves; on the contrary, we cannot speak too highly of the very great care—not only on matters of principle, but also on the most minute details affecting the various trades—which has been bestowed by them. The inquiry was necessarily of a most complicated nature, and called for not only judicial calmness, but great concentration of thought on the part of the tribunal.

The agitation on the subject of Railway Rates and Charges commenced as far back as 1846, in which year a parliamentary committee reported that a revision of them had become imperative; but, notwithstanding this report, it was not until the year 1854 that an Act of parliament was passed relating thereto. In the course of working out this Act, it was found that other provisions were necessary, and in 1865 another Act of parliament was passed, followed by still another in 1873. During this period parliamentary committees were continually considering the subject, and the Railway and Canal Traffic Act, 1888, was the outcome of the report made to parliament by a committee which inquired into the incidence of railway rates during the sessions of 1881-2.

It need scarcely be said that the traders of the country, and not the railway companies, were mainly instrumental in thus keeping the matter before the attention of parliament, and the above dates show that, however tardy the redress was, it came at length (or was believed by the traders to have come) in the Act of 1888. If the railway companies had carried out the spirit as well as the letter of the Act, the matter would have been considerably simplified. As a matter of fact, the schedules of revised classification and maximum rates and charges submitted by the railway companies in pursuance of the Act, were not in the form, and did not supply the information required by the Act, and it is mainly attributable to this fact that the inquiry has been so long pending. So soon as the schedules were deposited with the Board of Trade, they were eagerly sought for by all sections of traders, and objections were speedily formulated, and in due time lodged, not, however, before an extension of the time allowed by the Act had been granted.

The inquiry commenced on October 15, 1889, and terminated on May 21, 1890. Between these dates, Lord Balfour of Burleigh and Mr. Courtenay Boyle sat eighty-five days, of which sixty were devoted to hearing English evidence on principles, and speeches of counsel, eight to hearing Scotch evidence, four to hearing Irish evidence, and thirteen days were devoted to the consideration of the important subject of classification. The questions on principles alone amounted to 43,602; and the official minutes occupy a space of 326 folio pages, but a perusal of these (if one could be found courageous enough to attempt it), would scarcely convey to the mind of the reader any definite idea as to the effect of the evidence and arguments submitted to the tribunal. Evidence was given at the inquiry on behalf of the horticultural trades by Mr. William Paul (Waltham Cross), Mr. R. C. S. Carrington (Richard Smith & Co., Worcester), Mr. Fraser (Leyton), and Mr. Goodchild, Secretary to the Nursery and Seed Trade Association, Limited.

The course now to be adopted will be for the Board of Trade to submit to Parliament a provisional order applicable to the London and North Western Railway Company and the Great Western Railway Company as fairly representative lines, and thus the matter will again come before Parliament, and unless prominent attention be called to the matter, the provisional order will quietly glide through its necessary stages, and when this has been done it will have the effect of an Act of Parliament, and be enforced accordingly.

Our space will not allow of a critical examination of the evidence adduced, either by the railway companies, or on the part of the traders; nor can we, in an article such as this, attempt, with any idea of success, to place before our readers any adequate notion of the degree to which their interests as traders are affected, but we reserve for ourselves the right of commenting on the report of the tribunal when issued; meanwhile, the trade should bear in mind that the ultimate battle will have to be fought in the House of Commons, and we would strongly recommend that they should bring to bear all the influence they have with their representatives in Parliament, in order to induce them to take an active interest in the matter, so that, when it comes on for discussion, they may be in a position to defend the interests of the traders of the country against the combined attempts of the railway companies to obtain advantages over them.

ORCHIDS AND OTHER PLANTS AT THE GRANGE, HACKBIDGE.

The collection of A. H. Smea, Esq., is one that is rich in fine forms of *Cattleya Mendelii* and *C. Mossiae*, good varieties of *Odontoglossum*, and many other rare or curious botanical plants. Scores of plants of the finest varieties of *C. Mossiae* were in bloom on the occasion of my visit, each being different in some way from others, or marked by some special feature. White forms are found, commencing with the white *C. M. Wagnerii*; then followed by *C. M. Reinbeckiana*, a *C. Wagnerii*; as it were, but with a broad expansive lip, with crimson marblings; *C. M. Arnoldiana* comes next, with bluish-coloured flowers, the labellum freckled with purplish-rose. Of the coloured petalled forms, the *C. M. Schroderiana*, a plant which attracted so much attention at the Temple Show of 1889, was remarkable; its petals of a pale rose colour, and the rounded and frilled lip devoid of the usual purple colour, but with white primrose and pink colours instead. Another handsome variety, *Cattleya Mossiae* Mrs. Smea, is represented by a specimen with twenty-one flowers, of a warm shade of rose, the large labellum displaying bright orange at the base, on which is a violet-crimson oblong blotch, and the lip is finely crimped at the lavender coloured margin. *C. M. majus*, from the collection of the late Major Ludj, is fine; *C. M. Southgatei*, richly coloured, but not so good as the superb *C. M. Londinensis*, another favourite of the Royal Horticultural Society's Temple Show of last season, and which has the finest flower and richest lip of any, although *C. M. Rothschildiana* and other finely-coloured varieties were in flower to compare with it. *C. Mossiae* Smeana has very delicately tinted flowers, the labellum brightly marked, and the old *C. M. aurantiaca*, with an almost wholly orange labellum, forms a variation which is not often seen in recent importations of the plants. Among the less showy forms was a singular-looking small-flowered *C. Mossiae*, the edge of whose lip is quite flat and unfringed, presenting much the same appearance as an ordinary *C. Mossiae* would do if the lip were clipped. Among the *C. Mendelii* were many handsome varieties, but all in point of beauty fell short of *C. M. Hackbridgensis*, which is a charming novelty—the sepals and petals white, the petals with a heavy rosy-crimson tip, and the lip of a glowing crimson colour. It is not one of the largest, but it is certainly one of the most attractive and novel of *Cattleya labiata*; *C. Schroderae* and *C. S. alba*, too, were in bloom; also *C. labiata* Warnerii and other species, all of which seem to grow and flower well in the new *Cattleya*-house, the ventilation in which is novel, but perfect. Air is introduced at the bottom, near the level of the hot-water pipes; at two-thirds of the height of the house, at the eaves, the entire sides of the ridge may be lifted; and into a trough running along the ridge at the highest point from end to end the heated air passes through openings and out into the air through three openings which are fitted each with a movable cow. In the East Indian-house an experiment is being carried out (Mr. Smea and his clever gardener, Mr. Cummins, are fond of

trying feasible new methods) of growing *Phalaenopsis* on concrete slabs, used as blocks, and suspending them against the wall, and in other parts of the house. The plants which were unhealthy when placed on these slabs have become strong, and their roots cling to the concrete readily. Some sickly plants of *Angraecum Ellisii* were also so fixed with similar good results. Several fine species were in flower in this house, the most noteworthy being a charming form of *Phalaenopsis speciosa* with several spikes, the sepals mostly coloured with rich rose, whilst the petals are white with a large rose blotch. *P. Manni* is also in bloom here.

In a house among a good display of *Odontoglossum* and *Masdevallias*, we found the remarkable *Odontoglossum crinitum saphiratum*, a hybrid in which *O. Wallisii* is supposed to have played a part; *O. Smeannum*, another hybrid, and a most puzzling thing. It is not *O. Andersonianum*, or *O. Wilckeannum* or *O. elegans*, or *O. majus*, or any other known variety, but it has some of the features of all four.

In the flowering house, nicely set up with Ferns and flowering plants, a good display of *Cattleyas*, *Laelias*, *Odontoglossums*, *Cypripediums*, &c., was observed, and many uncommon species, as *Brassia caudata*, *B. antherotes*, *Ornithochloa grandiflora*, *Sarcandra paniculata*, *Oncidium candidum*, *O. macranthum hastiferum*, *O. pulvinatum*, *O. Janeriense*, &c. Here, too, were fine specimens of *Epidendrum vitellinum*, *Vanda suavis*, *Sobralias*, *Cypripedium caudatum*, *C. Elliottianum*, and a fine lot of *Odontoglossum citrosum* arranged by the cool-looking bay filled with *Todea superba*. In bloom in this house were fine examples of *Odontoglossum luteopurpureum hystrix*, and *O. Pescatorei*; and some grand flowers of *Cattleya citrina*, which filled the house with fragrance. Every part of the Grange Gardens is interesting, and Mr. Smea and his gardener work together to maintain its interest. Here in the valley of the Ferns, now beautiful with the frondage of British species, are many exotic species, such as *Struthiopteris germanica*, and the still more stately *S. pennsylvanica*, *Adiantum pedatum*, *Oncoclea sensibilis*, &c. On staging placed over the water were the Orchids, whose summer treatment outdoors has hitherto given such good results. Here in a sheltered bend is a specimen of *Todea intermedia* that is 6 feet across, and is only protected by a frame with plate-glass lights made specially for it.

In the conservatory are the tree Ferns and a specimen of *Cereus peruvianus*, 12 feet in height; the flowering plants of the season being arranged among them. Outside, the beds of herbaceous perennials make a great show in front of banks of shrubs which were gay with *Rhododendrons* and scarlet Hawthorn. The most showy flowers now are the white and blue forms of *Centauria montana*, large patches of scarlet *Geum*, tufts and edging of *Stachys arvensis*, and *Saxifraga umbrosa*, and other species. Here flourishes the graceful *Digitalis*, the golden *Chryso-bactron Hookeri*, the many-coloured *Irises*, and a host of other things, all of which must have added to the attraction of the Orchids in flower, the opportunity to inspect which nearly 2000 visitors availed themselves of on the occasion of the opening of the gardens to the public on June 1. J. O'B.

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEE.

We may hope that the forthcoming exhibition of the National Carnation and Picotee Society, at Chiswick Gardens, will be superior to any of its predecessors, and that the Conference, on July 22, will be the means of extending a knowledge of these delightful flowers in regard to their culture as exhibition plants, and the best methods of border culture. Carnation and Picotee growers should well digest the subject matter of the various papers which will be read at the Conference, as well as contribute, where possible, something to the discussion which

will follow the reading of the papers. Three papers will be read—viz., one on "Border Carnations," by Mr. R. Dean; "The Florists' Carnation and Picotee for Exhibition," by Mr. H. Turner, of Slough; and "The Carnation and Picotee as a Town Flower," by Mr. M. Rowan, of Clapham. The three subjects to be treated in these papers embrace a wide range, affording an opportunity for every kind of cultivator to take part in the discussion, and I hope that such an excellent opportunity will not be lost.

The exhibition Carnation and Picotee have certain well defined limits, known to all florists; but in these days of activity in raising and hybridising, the various classes have been and are still being extended. Many cultivators of Carnations and Picotees are greatly puzzled as to the different classes, or sections, into which their favourite flowers are divided; but these divisions are simple enough, and need but a practical demonstration at an exhibition to make the matter clear. This kind of teaching is of more value than any explanation which could be given in print, without any ocular demonstration at the hands of a florist.

The bizarre Carnations are commonly placed first, and have two colours on a white ground, viz., scarlet and maroon; crimson and purple; pink and purple. The next three classes have one colour, flaked on a white ground, viz., purple, scarlet, and rose.

The white ground Picotees also have six classes, viz., light and heavy red; light and heavy purple; light and heavy rose, or scarlet. There are, therefore, twelve easily defined classes according to colour, and the older florists did not admit anything else into their classification of these flowers. They also defined the height of the flower-stem, the width of the flowers, the length, breadth, and substance of the petals; the arrangement of the petals; the curvature of the edge of petals; the length and substance of the calyx, &c.

The yellow ground section has found a place in the National schedule ever since the establishment of the Society in the South. Improvement in this group was not very rapid at first, and for some years no more was done than merely to mark time; but the last few years have seen some changes, due, to a certain extent, to the greater number of exhibitors in this class; last year, there being four times more than at any previous exhibition, and the prospects for the present season are better than ever. Flowers of one colour only, whatever that colour may be, are termed selfs, and a nondescript group with fantastic colours finds a place among the fancies. These are usually run seedling flowers of other sections, mottled or spotted.

The selfs and fancies form classes much admired and exhibited, although the true florist cares nothing for them. With regard to tree Carnations, these are usually grown under glass; but it will be found on placing them out-of-doors that they do much better during the period from the end of May until September. The roots must not be cramped for want of space in the early stages of their growth, a check at that time not being readily recovered from. I find a little fibrous peat added to the Carnation compost is a good thing for perpetuities; and it is essential that the plants be kept free from greenfly. One stick may be placed to each plant for support, the side-growth being fastened loosely to it. J. Douglas, *Hford, Essex.*

PLANTS AND THEIR CULTURE.

THE PLANTS OF THE SHOW.—Plants will have made rapid progress if the treatment has been that which was advised in my previous Calendars, but a very small amount of fire-heat will have been necessary, except during exceptionally clear, cold nights; and this is of great importance, as the use of the apparatus, together with increased sun-heat, causes insects that infest plants to multiply enormously, rendering the gardeners' labours in plant cleaning excessively tiresome. Occasional supplies of weak liquid manure and much water will be needed by all strong-growing and well-rooted plants. Plants,

especially strong-growing ones, should not suffer for want of root-space. Many of the plants for autumn blooming may be repotted, so as to secure early growth and maturity. Pits and frames may be utilised for growing some of these plants, closing these structures early in the afternoon, and airing them with care. The plants so grown will be sturdy, and, being close to the glass, will not get drawn. The hardier stove plants, such as Palms, Rhopalas, and Dracenas, which have made early growth, may now be transferred to greenhouses and conservatories, not affording them much water for a short time after removal from the warmer house, and placing them out of the way of cold draughts. Some of these plants will be benefited by the greater amount of space allowed them to develop.

used in place of cow-dung. The cuttings of *Gardenia* struck in the spring will require to be shifted into larger pots, keeping them very clean, as previously advised. Syringing with Bentley's soluble petroleum will destroy mealy-bug; mixing readily with water, it is not dangerous, like ordinary petroleum. *Ixoras* coming into bloom may be removed to a drier and cooler house, where they will last longer in perfection. When *Ixoras* are required for cutting, sparingly supply them with water, if in the cool-house.

Anthuriums should be watered with weak liquid manure, and any plant in full bloom may be removed to a cooler house for a time, if it be desirable to retard the plants.

Dipladenias coming into bloom require a liberal

THE ORCHID HOUSES.

EAST INDIA HOUSE.—The *Saccolabiums* in this house furnish a quantity of flowers at a dull season; and with such species in flower as *S. ampullaceum* and *S. curvifolium*, followed by *S. Blumei majus* and *S. celeste*, much may be done in keeping the house gay with bloom until the autumn; the last-named plant has the sweetest perfume of any of the genus.

Dendrobium nobile and *D. Wardianum* should be watched, so that none of the early-flowering plants are allowed to get dry at the root, for when this occurs, the already half-formed pseudobulbs are very

FIG. 123.—*PAEONIA CORALLINA*: FLOWERS CRIMSON. (SEE P. 736.)

Gesneras—*zebrina* and others—should now be shifted, if a few of these were placed in small pots as advised; and any tubers left over at the last potting should be shaken out of the old soil and started into growth, using small pots for the purpose. *G. Doneklaarii* is a fine decorative species, worth growing.

Gardenias, now nearly over, may, in the case of old or unsightly plants, be thrown away, and the plants of moderate size examined, the shoots shortened back, and when they have recommenced to grow, be repotted, keeping them close for a time, and a little bottom-heat may be afforded them to induce early and free growth. A moist, warm pit is a good place for *Gardenias* in summer. Equal proportions of turfy peat, fibrous loam, decayed cow-dung, with some charcoal broken small, and coarse silver-sand, make a good potting compost. Bone-dust may be

supply of water, and occasionally liquid manure. Late plants may be repotted, and the shoots tied out. *Stephanotis floribunda* will last in bloom longer if the plants are removed to a cooler house, and are best when the growths are trained separately on strings just under the roof. These may be readily removed entire when in bloom. *Clerodendrons* likewise, do well in a house cooler than the stove, but syringing them overhead must be discontinued when the plants are in bloom, and decayed flowers removed daily. These plants remain in bloom for weeks when this practice of taking off spent flowers is followed. When flowering is over, give the plants stove treatment, and plenty of weak liquid manure. If the plants are small, shifting them into larger pots will do good. Creepers on the roof should be attended to before their shoots get entangled. *G. Wythes*, *Syon House*, *Brentford*.

apt to break again into growth at the base—always a misfortune, in throwing the plant out of its regular season of flowering; but if a very long season of rest be not afforded it, free growth is hindered the following year.

Miltoria Morelliana, now coming into flower, delights in heat and moisture; as also *M. spectabilis*. Hung up to the roof, these plants grow and flower freely. Amongst *Aerides* now flowering may be mentioned *A. Godefroya*, which is a grand variety of *A. affine roseum*, but with flowers as large again as those of the type, and much brighter in colour.

Unremitting attention should be paid to destroying insects, and no day should pass without someone being deputed to examine the young roots of *Phalaenopsis* for lurking cockroaches. These pests eat the roots on the under side near the points. It is a good practice to lay down some poison once a week, as by

so doing the small insects that are apt to get introduced in new plants are destroyed. The sponging of the leaves of the plants, scrubbing the pots, and stages, &c.; are details of work which should not be neglected at this season. Nothing in this house will be likely to suffer from overhead syringing done in the morning with the exception of *Calanthes*. The temperature must be kept up to 75°, with a rise of 15° by day. *A. G. Catt, Parkfield, Hallow.*

THE FLOWER GARDEN.

The planting of all kinds of bedding plants should be carried on speedily, so as to allow the plants when in the soil the benefit of the genial showers which continue to fall in nearly all parts of the country. Attention should be paid to the stopping of shoots of the various kinds of plants, and their training and regulation; also to the removal of blossoms from *Pelargoniums*, *Calceolarias*, *Verbenas*, *Petunias*, &c., until the plants have become somewhat established. Carpet-bed plants require a good deal of manipulation, so that the designs in the beds be kept intact.

In dry situations, and where the soil is light, the flower-beds are the better for being mulched with leaf-mould, spent Mushroom-bed dung, or Cocoa-fibre, the moisture being thereby better retained in the soil than when it is left bare. A mulch is also a great economiser of labour in dry weather, not much watering being required. Where mulching is not resorted to, a frequent slight hoeing of the beds should be made, especially after heavy rains or artificial waterings. When the bedding is completed, the beds, walks, and lawns, should be tidied up; and Box-edgings still left untrimmed should be clipped without further delay. Where there has been a large amount of work in the removal of spring plants, in manuring and preparing of the beds, the tidying up will not be perfect if a coating of new gravel be not given to all the walks in the neighbourhood of the flower garden.

The Herbaceous Borders.—The plants in borders will be benefited by the soil being mulched with short dung. The foliage of all kinds of bulbs, as it dies away, should be cut off, and the bulbs taken up, or their site marked with a short stump, or a label; surplus bedding plants or annuals being planted near by, but so as not to injure them. Stakes and tie securely all subjects that require it, and continue to pay attention to this matter, otherwise winds will spoil their beauty.

Beds of *Gladioli* should be well stirred on the surface until the plants are in vigorous growth, when a good mulching of dung will be of benefit to them. Seeds of Sweet William, Wallflower, Delphinium, Aquilegia, Digitalis, Canterbury Bells, &c., may still be sown in the open air, and the seedlings should be frequently dusted with quicklime to defend them from slugs.

Sweet Peas should receive their supports before they fall over on to the ground. *Convolvulus*, *Canary Creepers*, *Murandays*, *Lophospermum*, *Loasa*, &c., should also get support from stakes in the early stages of their growth. *D. C. Powell, Poodrhaia Castle, Devon.*

FRUITS UNDER GLASS.

STRAWBERRIES IN POTS.—The latest hatches of British Queen will now be ripe, and the house may be utilised, after a good cleansing, for Melons, Cucumbers, or Tomatos, strong plants of which have been specially prepared for the purpose. In cold districts the latest Strawberries are sometimes protected with cold frames. These may be in pots, or planted out, and, under good management, the fruit is obtained. The fruits must be suspended, or slugs and miller will disfigure them. In the Midlands, Laxton's Noble is ripe out-of-doors in the middle of the present month, the plants being raised from runners planted out in August on a south border. The fruits are superior as regards flavour to any grown in pots indoors, and the variety may be regarded as an acquisition. The securing of the earliest and strongest runners is an important factor in Strawberry forcing, and steps should soon be taken to obtain them; the plants will then be sturdy, and will fill their pots with healthy roots, and the crowns, which should be single ones, will be plump

and well matured by the end of the season. The best early runners are obtained from rooted runners put out in the reserve ground in August of the previous year. La Grosse Sucr e, President, Noble, Auguste Nicaise may be included among the varieties grown for forcing. In spring the blossoms of these mother plants should be cut off, so that the forces of the plants may be utilised in making runners. All blind or degenerated plants must be removed as such are noticed.

In laying we use clean dry pots, with a moderate amount of drainage, and ram the compost—a turfy loam one year stacked—into the pots, but leaving sufficient space for watering. Five-inch pots are best for the earliest forced plants, and 6-inch for late ones. Arrange the pots conveniently for watering purposes. Stop runners at the first joint beyond the layer, which must be kept in its place with a peg, &c., till rooted. Sprinkle the layers every evening, and attend carefully to the watering of the pots. When rooted, cut the runner from the parent plant, and rearrange them thinly on beds of coal ashes.

Fig Houses.—Ripening Figs must have abundant ventilation, or the fruit will be deficient in colour and flavour. Do not overwood the foliage, but thin out useless shoots. The stopping of shoots must cease in the early house. Trees for next year's forcing should have their second crop of fruits severely thinned, in order to economise the strength of the trees. Allow the sun's rays entry to the house as much as possible, to give colour to the fruit and ripen the wood. Train the shoots thinly, and tie them loosely to the trellis, if planted out.

Figs in shallow borders will require copious waterings with manure water, and should the mulchings have become occupied with roots, another dressing may be added to the old. To keep red-spider in check, use the syringe as much as the ripening state of the fruits will permit. The small white scale common on Figs increases fast at this season, and attacks the fruit as well as the shoots. It must be removed by hand, no insecticide being allowable. This species of scale is best dealt with when the trees are dormant.

A species of red-rust attacks the foliage, and it is probably caused by a draughty ventilation, or the steam arising from syringing highly-heated pipes. There is, so far as I know of, no remedy for this evil. Brown Turkey is still our sheet anchor, but Negro Largo and Grosse Verte are good and fruitful varieties, making short stubby growth, suitable for early forcing, or permanent planting in shallow borders, and doing well in pots. Cuttings of dormant wood, struck in spring, will commence fruiting nicely the third or fourth year afterwards. These little-bushes can be so managed as to produce fruit of good quality in succession, taking one crop only in a year, and then resting them out-of-doors, where they should not be exposed to rough winds, which are so hurtful to their foliage. *W. Cramp, Maltesfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

THE PROTECTION OF FRUIT.—Strawberry beds on which the fruits have begun to change colour should have fish-nets put over them. We put a wire-netting sufficiently close in the mesh to exclude blackbirds, &c., all round the beds, pegging it to the ground, and fastening it to short stakes to keep it upright; iron or wooden rods are bent across at intervals to keep up the fish-netting, which is laid on the top. So managed the gathering of the fruit is conveniently done. The same kind of protection, but with rods of different length, is employed for Currants, Gooseberries, and Raspberries. By using wire-netting for the sides, the fish-netting lasts much longer, and the birds are effectually kept out. The fish-netting is fastened to the top of the wire-netting.

Peach and Nectarines.—Some gardeners believe that blister on these fruit trees will be cured on the advent of warm weather; but the fact is that the warmth seems to increase the evil. There is nothing for it but to pick off all the injured foliage; remedies, so far as my knowledge goes, there are none. But the leaves once removed, the young wood grows apace. The curl of the leaf is due to aphid, and these insects are very troublesome this season. Sometimes it is caused by root inaction, cold soils, and consequent immature wood. Insecticidal soils, which are strong enough to kill the fly are apt to be damaging to the fruits in their present stage, and the safest thing to use at this moment is tobacco-dust, a puff of which from a pair of bellows

is generally sufficient to dislodge them, and a copious syringing clears away those that are left. Continue to pinch and cut back the young shoots, and train in all necessary wood for next year. Any tree which has a light crop is sure to show very strong growths, and timely attention must be given to such in training and stopping, and giving the wood full exposure to light. On these vigorous trees the new growths may be pinched closely, which is preferable to disbudding them at this season. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN.

THE BRASSICA TANK.—Brussels Sprouts should now be planted out in large batches, 3 feet apart for the Osterspool variety, and a little less for the dwarf varieties. Let the quarter be free and open, and unshaded by fruit trees, and plant firmly on soil not made too rich. Light soils, or those containing much trenched-in manure, must be consolidated by tramping, or loose Sprouts will form. Give seed-beds a thorough soaking with water before removing plants for planting; and again afterwards, to settle the soil, and fill up holes. If the ground be very dry, dip the plants in puddle, and draw a little dry soil over and about the roots.

Cauliflowers, including Veitch's Autumn Giant and Self-protecting, should be planted, allowing more space between these two varieties than is usual with Walcbreen. Lift the plants with a trowel, and plant them with the same implement, not breaking the ball. Cauliflowers want considerable quantities of water throughout the growing season. Plant the late summer Cauliflowers on well-dunged, deep-dry soil; but for Autumn Giant, poorer soil, free of rank manure, is more to be advised. Early-planted Cauliflowers may be supplied occasionally with manure-water, doing this copiously.

Kales, Sprouting Broccoli, &c., may be planted in an open site, either on ground by themselves or between the rows of early Potatoes. The first-named is the better way, and in that case they should stand 2 to 2½ feet apart. Make the soil firm to induce sturdy growth.

Cabbages and Savoys.—Any of these vegetables may be planted, but in warm parts of the country it is yet too early to plant them in quantity. The early *Fin Savoy* needs not more than 1 foot space from plant to plant, whilst *Drunhead* should stand at 20 inches apart, and in rich land at still more. Another sowing should be made of Coleworts and Little *Pixie* Cabbages, to plant out after some of the summer crops are cleared off.

Sweet Runner Beans may be sown, the seed being put in at 6 inches apart in the rows, and if the weather be dry, water the trenches before covering up the seed. Earth up the early sown Beans, and put the stakes to them before injury is done by wind.

Celery.—The main crop plants, now large enough, may be put into the trenches. It is important that Celery never gets checked by want of water or otherwise, and if the trenches have been properly prepared in advance, all that is required is to water the beds of pricked-out plants before lifting, and remove a few at a time and plant, watering them at once. The afternoon is the best time to plant at this season, unless it be showery weather. All fresh-made trenches need to have the dung and soil well trodden before being planted. I have an idea that Celery from new seed is inclined to come with pitty leaf-stalks.

Continue to plant Lettuces in quantity, according to demand, selecting cool aspects. Make frequent sowings of Lettuces, Mustard and Cress, and Radishes, Chervil, and other quick-growing herbs. Top the early sown Broad Beans, and make another sowing of the early long-pods or Mazagan Beans. *H. Markham, Mereworth Castle, Maidstone.*

DRIED BANANAS.—We have received from Mr. Rodwell, of George Town, Demerara, some specimens of Fig Bananas, the flavour of which was rich and luscious, but which, from defective packing, were slightly mouldy on arrival. If this defect can be overcome, we think there might be a market here for these delicious fruits. We learn that they were dried in heated sand at a temperature of about 150°.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, JUNE 19 — Luncheon Society.

SHOWS.

WEDNESDAY, JUNE 18 — York Gala (three days).

THURSDAY, JUNE 19 — Ryde.

FRIDAY, JUNE 20 — Scottish Pansy.

SALES.

WEDNESDAY, JUNE 18 — Japanese Maples, Ferns, Palms, &c., at Frotheroe & Morris' Rooms.

FRIDAY, JUNE 20 — Established Orchids, at Frotheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK. — 61° 2.

served, or when some other hypothesis is devised to give a wider range of vision. Observation, comparison, inference, hypothesis, theory, these are the progressive stages through which the worker in natural science must pass in his search after truth. If from necessity or choice the worker confines himself to one department only, his capabilities as a practical man are necessarily limited in direct proportion. The theory of evolution, the hypothesis of natural selection, seem at first sight of too abstract and impractical a nature to be of any value to the cultivator. But let any one who remembers the *status quo ante* DARWIN, take cognisance of the wonderful advance in science, and of the wealth of facts—of facts, we repeat, which has been put at the disposition of the cultivator as a direct consequence of these theories, and he will be forced to admit that the practical man must have been a gainer in spite of himself sometimes, and that he will be increasingly so in the future, as the knowledge so obtained gradually filters into the brain, to be handed down to his successors as inherited experience!

We are led to make these remarks, in view of the discussions now rife, as to the manner in which the characteristics of living creatures, animals, or plants, are transmitted from generation to generation. The subject is a very abstruse and difficult one, but it touches upon the principles and even the practice of the cultivator at so many points, that it is not inappropriate to refer to it here. All creatures begin their existence in the simplest and most homogeneous manner; the simplicity of construction is rarely permanent, but usually gives way gradually to complexity of organisation, so that we find a mass of tissue, the "sona" of WEISMANN, whose office is to obtain nourishment and to increase by subdivision; and from this are evolved in course of time, and according to circumstances, the reproductive elements male and female. By the blending of the sperm and germ elements, a new creature is formed by division as before. Dr. WEISMANN thus draws a distinction between what he calls germ-plasm and sona-plasm. The germ-plasm has, in his opinion, hereditary endowments, and can be influenced by external conditions; moreover, it is, in his opinion, limited to a certain series of cells, while the somatic cells have no such hereditary endowment, and the changes and modifications produced in them by external conditions are not transmitted. We cannot pursue the subject further without entering into technicalities, which are not strictly necessary for the comprehension of the main point at issue; but we may refer to an address before the Linnean Society by the Rev. Professor HENSLOW on the 5th inst., and of which we append an abstract; as well as to an article by Dr. BONAVIA on the same subject in another column (p. 736).

Illustrations of the hereditary transmission of "acquired" characters were shown by Dr. MASTERS in the shape of a series of contorted Teazel stems received from Dr. DE VRIES, of Amsterdam, and which were the offspring of similarly distorted parents. Peloria, double flowers, and numerous other acquired conditions, are familiar to the gardener as reproducible by seed, and therefore offer exceptions to Dr. WEISMANN'S hypotheses, which he has to explain in some way or another. In the meantime, whether his particular views be ultimately accepted, or whether they be found incorrect, and discarded accordingly, their discussion must serve to bring out a host of previously unknown facts, and to make clearer a number of those already gained to science, and of these the

practical man will, as we have said, have the benefit.

Mr. HENSLOW, on the occasion above referred to, limited his observations to three propositions maintained by Dr. WEISMANN.

1. That there is a continuity of "germ-plasm" maintained in a "certain series of cells," from the germ-cell of the parent to the germ-cell of the offspring.

2. That characters acquired by individuals during their life-time by "use, disuse, practice, neglect, variations of nutrition, light, moisture, and climate" (p. 387) are not hereditary, and cannot be transmitted, because the influence of the "environment" can never reach the germ-cells.

3. That the transformation of species is due (i.) to direct changes in the germ-plasm of the germ-cells, effected by external influences; or else (ii.) by combinations of distinct germ-plasms by sexuality.

1. With regard to the first point, he showed that as plants can be propagated by the vegetative system anywhere, provided there be "embryonic cells" present, and a sufficient local nutriment within the tissue to develop roots, the theoretical germ-plasm must be generally diffused, and not localised in some definite (but unknown) track, as Dr. WEISMANN imagines.

II. and III. Mr. HENSLOW cited three cases in which characters acquired by plants during their lifetime were hereditary, viz:—(i.), Parsnips raised by Professor BECKMAN in 1848, from wild seed sown in a prepared border, showed "improvement" in the first season. This was more pronounced in the second generation from seed raised from the plants so cultivated; (ii.), Plants watered with salt-water by M. LESAGE developed a fleshy foliage similar to that of maritime plants. He found that seed saved from Cress thus treated showed a still further advance towards the "maritime" character in the second generation; (iii.), Professor BAILEY raised Squashes of different kinds from different soils, which proved to be hereditary.

It is to be observed that in the first two cases, no germ-cells existed while the roots of the Parsnip and the leaves of the Cress were being formed, as the development of the vegetative system of plants always precedes that of the reproductive. In the last case, the fruit was formed after the germ-cells of the flowers had ceased to exist. Mr. HENSLOW then pointed out that if the effects of the environment can and must be registered only in the germ-cells, as Dr. WEISMANN supposes, the time at their disposal is too limited. Thus in annuals the vegetative system is exposed to the environment for weeks; that of trees and shrubs it may be for years, and an Agave may require fifty years before it blossoms; but the time of flower (which alone contains the germ-cells), lasts but a few hours only. In Ferns, too, there are no germ-cells at all, these being confined to the ephemeral prothallus.

Mr. HENSLOW observed that he might (if it be thought necessary) appeal to Dr. WEISMANN'S theory in support of his own contention, that the adaptations in flowers to insect fertilisation had been brought about by the direct influences set up by the insects themselves, for the germ-cell in the ovule and the sperm-cell in the anther were directly irritated by the visiting insects, and so capable of receiving impressions which manifested themselves in hereditary adaptations to the insects.

With regard to the last position, that sexuality is a cause of variation, it would seem that the remarkable constancy of specific character which prevails in Nature is somewhat adverse to the theory; but under cultivation variability is the general feature. This Dr. WEISMANN attributed to "panmixia," or indiscriminate crossing, in consequence of the withdrawal of natural selection. Dr. WEISMANN maintains that this will bring about atrophy; but hypertrophy, not atrophy, is the most frequent characteristic of cultivated plants.

Dr. WEISMANN says, that by "panmixia" there "follows a mixture of all possible degrees of per-

The Theory of Heredity.

THEORIES and hypotheses are not in general viewed in any favourable light by the so-called practical man. Nothing is more common than to hear from his lips the expression, "an ounce of fact is worth more than a ton of theory." Nothing is more certain, however, than that such an expression represents only a fraction of the truth, and that fraction seen from one standpoint only. Moreover, experience shows that if he wants facts, there is no surer way of bringing them to light than the discussion to which a theory gives rise.

The practical man, without knowing it, avails himself of information which in his forefather's time, nay, even in his own, was a matter of speculation. If he confines himself to what he himself has seen with his own eyes, and learnt by his own experience, his range must of necessity be extremely limited, even supposing him to have seen correctly, and to have interpreted faithfully—assumptions that are not likely to be admitted as correct by anyone except himself. That word interpretation is very significant. The bare fact or facts observed by the practical man are of no value, either from a scientific or a strictly practical point of view, till they have been correlated with others, and their meaning made clear—interpreted in fact.

Theory is the correct interpretation of facts, and as such of permanent value, while hypothesis is the conjectural rendering made use of, provisionally, as steps may be, to afford the observer a more convenient and comprehensive standpoint, but to be no longer used when the purpose is

fection, which must, in the course of time, result in the deterioration of the average development of an organ" (p. 292). But he has overlooked the prepotency of a healthy parent. Thus a "semi-double" flower crossed by a "single" one gives rise to "singles," and not to a deteriorated offspring.

Hence, as far as plants are concerned, there does not appear to be anything which countenances Dr. WEISMANN'S theory as represented in his book; but supposing the hypothetical substance, germ-plasm, to be really necessary, if it be generally diffused through a plant, one can account (1) for the universal pro-

growing the beautiful Water-lilies and other aquatic of tropical and subtropical regions. As at the Royal Gardens, Kew, the tank occupies the greater part of the area of the house, and is surrounded by a path. Around the glass walls of the house, creepers of various species are grown on trellises, affording some amount of shade in summer, and giving a furnished appearance to the structure. A tank for Lilies is made usually 2½ to 3 feet in depth, with a cemented or stone floor resting on a very solid foundation. A drain exists at the lowest point, and an overflow drain near

for *C. gigas*, *C. Dowiana*, and others of this group, a fine display of bloom was to be seen recently of the varieties of *C. gigas*, which, notwithstanding the fact of their blooming heavily each year, are very healthy, and magnificently flowered. One of the richest in colour is *C. g. Shuttleworthii*, but the whole of the stock of these plants, either by reason of good culture, or lucky selection, has large and richly-coloured flowers. In the other *Cattleya*-houses *C. Mossii*, *C. M. Reineckiana*, are fine, the latter illustrated by us, August 9, 1884, having again had fifteen flowers on it this year. *C. M. Wagneri* is also good

FIG. 124.—WATER-LILY HOUSE, BOTANIC GARDEN, CAMBRIDGE.

duction of buds capable of propagation; (2) for the acquisition of acquired and adaptive characters; (3) for their conveyance (by the aid of protoplasmic continuity) to the germ-cells when they arise, and so for hereditary character of acquired adaptation.

If this be so, the question arises. Is there any necessity for germ-plasm at all? May not protoplasm be capable of effecting all the phenomena of plant-life?

WATER LILY HOUSE. CAMBRIDGE BOTANIC GARDEN.—The view of the Water-lily house, Cambridge Botanic Garden, reproduced in Fig. 124, gives a good idea of a useful kind of structure for

the top of the tank; and some few pipes from the heating apparatus are conducted through it, for the purpose of warming the water when the plants are starting into growth, and for some time afterwards. It is not an uncommon practice to run the water out of the tank when the foliage of the perennial inmates begins to die off; and place the plants to rest in tubs of water, kept in some other warm house. By so doing, the heating of the tank in the cold weather is unnecessary, and the house may be devoted to other plants for a time.

CATTELYAS AND LÆLIAS AT LORD ROTHSCHILD'S.—At Tring Park, where a house is set apart

and the varieties of *C. Mendelii* profusely flowered. There is also a houseful of *Lælia purpurata* in bloom, a houseful of white and coloured *L. anceps*, many of the specimens being 2 feet in diameter; a sprinkling of *Odontoglossum* plants in flower; a good display of *Anthuriums*; and the *Vanda teres*, which are planted out, and the *Phalanopsis* are in grand health. *V. teres* having still many splendid spikes, although large numbers have been removed.

NEW POTATOS IN MAY.—The first English-grown new Potatos of the season seen in the Horn-castle part of Lincolnshire were on Saturday, May 31, sent to the Newcastle market by Mr. T. KIME,

of Marchand-le-Fen. They were very quickly all sold at 6s. per pound. The variety was that known as Sharpe's Victor, a very early kind. It is a circumstance unprecedented in the Horticole district for new Potatoes to be for sale in the market in the month of May. Hitherto, June 12 has been regarded as the earliest date, but Mr. T. KISS, who enjoys the reputation of being a great authority in Lincolnshire on Potato culture, has beaten the record by nearly a fortnight.

THE "ILLUSTRATION HORTICOLE."—In the last issued number of this publication are plates of *Malgipha liliifolia*, discovered in Cuba in 1838 by M. Linden. The plate (t. 103) is taken, life-size, from the plant introduced by him in 1841, and it is now a small shrub 18 inches in height. The leaves are like those of the Holly, and dull green, and the flowers are rosy-pink; and of *Azalea indica* var. *Mille Marie Vervaeue*, white, with rose flakes, semi-double (t. 104).

FLOWERS AND PLANTS FOR THE LONDON POOR.—We have received the following appeal from E. E. THUR, Hon. Sec. Flower Distribution Branch, Kyrle Society, 14, Nottingham Place, W.:—"The summer having returned, I again ask your kind permission to bring before your readers both the need of flowers for the London poor, and the gratitude with which they are received. As you are aware, the number of open spaces has much increased, with their increase comes also a demand for plants of all kinds for stocking them, so that we shall be thankful for gifts of these, or for money to purchase them. I shall be very much obliged if any intending donors either of flowers or plants would communicate with me in the first instance. I will then forward the address to which their kind gifts may be sent direct, as there being no storage place at the office, packages cannot be received there."

"KEW BULLETIN."—The June number, now before us, contains an article on compressed or tablet tea, dealing with the methods of its manufacture at Hankow, and at Chungking in Thibet. Timber trees of the Straits Settlements forms the subject of another paper. It contains much useful information on a great number of different species, giving the weights of a certain number of cubic inches, and of a cubic foot of each, and native names of the trees. Cotton in West Africa forms the subject of another paper.

NOMENCLATURE OF GARDEN PLANTS.—By LINNÆUS, what would now be termed florists were designated anthophilii (flower-lovers), who in his day applied to their plants names which excited astonishment, "*evocabalis stuporeca excitantibus*." He goes on to say that this is a separate department of knowledge, "*propria scientiam aditipis solis manifestam*," and warns the botanist off in these terms:—"Castris itaque coram nullus sonus botanicus intret." This may or may not be advisable—we express no opinion; but that by the same rule the anthophilii should abstain (as they did in LINNÆUS' time), from making use of botanical nomenclature for Orchids and other plants not botanically registered and described, and applying it to varieties, "*nee definita nec definienda et numero prae infuita*."

CARNATIONS AT TRING PARK.—Such favourites are Carnations with Lord ROTHSCHILD, that six houses full of Souvenir de la Malmaison are in bloom at the present time. The five plants are marvellously well flowered. One house contains the rose-coloured Princess of Wales, which is of the same form as the older S. de la Malmaison, but colour is of rose of varying shades, the darkest shade being towards the centre of the flower. Many hundreds of plants in all stages of growth are found in cold frames, and serve to keep up the succession of these beautiful flowers to a late period of the year. Notwithstanding the large quantity of this one plant which one finds in bloom here, the manner in which the plants are displayed excludes

the idea of there being too many; for instance, one bank of them is set up in the old conservatory, its mossed back wall planted with Ferns, and the roof and the pillars clothed with climbing plants, forming a nice setting; another houseful is arranged with Maidenhair Ferns, and so on. For a yellow Carnation, C. Germanica is considered the best variety, and a large house is filled with it. The plants are just now coming into bloom. Mr. Hill manages these things to perfection, and lengthens out their flowering stage to the utmost.

THE CARNATION AND PICOTEE UNION.—The annual exhibition of Carnations and Picotees will take place at Mr. DOWELL'S garden, Stanley Road, Oxford, on August 5. The schedule of prizes remains much the same as heretofore, with the exception that in the case of the class for single blooms of Picotees, the red-rose and salmon-pink-edge flowers will be shown together, and divided into classes for broad-edged, medium edged, and light-edged flowers; and the same will be observed in the case of the purple-edged Picotees, from deep purple to lilac. In addition, special prizes are offered from the sale of Mr. R. ELLIS'S new yellow-ground Picotee Maud—the 1st, for a decorative group of cut blooms, to be shown on a space not exceeding $7\frac{1}{2}$ square feet, without cards, but with foliage of its own or other plants—singly grouped or bunched, either in full flower, partly expanded, or in bud, at the option of the exhibitor; the 2nd is for six buttonhole bouquets, and the 3rd is for a lady's bouquet. The main object in offering these prizes is for the purpose of illustrating the decorative value of Carnation blooms.

FROST IN NORTH WALES.—A correspondent at Mold, in Flintshire, writes:—"My thermometer registered 3° of frost on the night of June 7, and a good deal of damage was done in the garden amongst Potatoes, Beans, and other plants."

ORCHID CATALOGUE.—The Dutch Orchidophile Club has published a supplementary *Nomenclator*, comprising the names and synonyms of certain species and varieties not included in the former publication. We believe that these very useful lists can be obtained from THE L. V. QUARES V. UTOORD, Spiegelstraat 8, La Haye, Holland.

VIENNA "LAND AND FORESTRY JOURNAL."—Under the title of *Land und Forstwirtschaftliche Anstellungen-Zeitung*, the official organ of the General Committee of the Forestry Exhibition now being held in the Austrian metropolis, came into being on May 14 last, and will be issued weekly until the end of the exhibition, October 15. It contains numerous illustrations of exhibits, long and short notices of forestry groups collectively, and specially; official notices, programmes, guide to the city and neighbourhood, and much miscellaneous information valuable to visitors.

THE EARLIEST STRAWBERRY.—In the collection of varieties growing in the Royal Horticultural Society's Gardens at Chiswick, the variety Crescent Seedling has proved itself to be the earliest this season. Ripe fruits were to be seen on June 9.

LINNEAN SOCIETY.—At the evening meeting, to be held on Thursday, June 19, at 8 P.M., the following papers will be read:—"Observations on the Protection of Buds in the Tropics," by M. CHENNE POTTER, F.L.S.; "On the Vertical Distribution of Plants in the Caucasus," by Dr. GUSTAV RADDE.

RISES AT CHISWICK.—These, which have been well described as the Orchids of the flower garden, make a gay display in a series of beds here just now. Amongst the earliest to flower may be mentioned *I. pumila cerulea*, standards and falls rich clear blue; *I. p. bicolor*, standards white, falls purple—a happy contrast; *I. p. lateo-maculata*, standards primrose, falls brown, edged yellow; *I. billorus atro-violacea*, standards and falls rich purple—flowers both in spring and summer; *I. obliensis virescens*, falls

mottled purple and sulphur, standards bluish-white; the well-known *I. germanica* major, standards blue, falls purple—a striking flower. Amongst the bearded flags, which are all beautiful, *I. flavescens*, with its primrose standards and light primrose falls, may be specially mentioned. In the beardless group stands out prominently *I. sibirica*, standards bright blue, falls blue, reticulated white. Amongst the later-flowering kinds in the squelens section *I. Lady Jane* is noticeable, standards coppery-rose, falls madder red, reticulated white, with yellow crest—an unusual combination of colouring. In the pallida group, tall and strikingly handsome is *I. maudralisae*, standards and falls rich lavender and purple. Another tall-growing var. (bearing large flowers), in this section is *I. Walner*, standards lavender, falls purple-lilac.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY.—The show of Orchids in flower at these nurseries is at the present season a particularly fine one, and well repay the visitors to this outlying suburb of London. We may mention a few of the fine things to be seen there:—*Agrides Houlettii*, *Angreecum Sanderianum*, *Bifrenaria vitellina*, *Calanthe masuca*, *C. Sanderiana*; *Cattleya Lawrenceana*, *C. lobata*, *C. Loddigesii*, and *C. Mossia*, many varieties; *C. Mendelii*, *C. M. grandiflora*, *C. Wagnerii*, *C. Warnerii*; *Cymbidium Lowianum*, and *Cypripedium* in great variety, including the finest and most novel hybrids, and species. *Dendrobium* are numerous. *Geolomium candidum* is in flower; also *Laelia cinnabarina*, *elegans*, *grandis*, *purpurata*, and *p. alba*; many *Masdevallias*, especially of the *Harryana* type. In *Orontoglossums*, there are *O. Alexandras*, *O. cordatum*, *O. cirrhosum*, *O. citrosimum*, *O. Harryana*, *O. nevium majus*, and *O. Roezlii album*. *Miltonia vexillaria*, in variety; *Oncidium cucullatum*, *Kramerii*, *macranthum*, *Marshallianum*, and *sarcodes*; *Paphinia cristata grandis*, *Scuticaria Hadwenii*, *Trichoplia*, and *Vandas*, always most successfully grown at Messrs. WILLIAMS'.

REPORT ON THE FRUIT CROPS: ENGLAND.—Reports from the Home Counties early in May spoke favourably of prospects and anticipations of good crops of all kinds of fruit. Since then changeable weather has been experienced—some days very warm, other days very cold; morning frosts—and all kinds of fruit have suffered severely. Plums (Damsons, Plums, and Green Gages).—The prospect is very bad; not one-tenth of a crop. In many places there are absolutely none. Pears.—Although all kinds, except Hessel, blossomed well, very few have properly set; and there are not many in England of either early or late kinds. Black and Red Currants promised well—even as late as a week ago, it was thought that crops would be good; but since then, in some districts, they have been attacked by honeydew, and the crop now cannot be more than one-half, even if that. Cherries promised well, but early kinds were destroyed the second week in May. Since then the later sorts have suffered; taking reports all round, they cannot be reckoned at one-third of a crop. Strawberries and Raspberries promise well, but it is feared that unless warm weather soon set in, the fruit will be small, and the bulk reduced one-half. Gooseberries at one time were believed to be an exceptionally fine crop, but since then many districts have been attacked by vermin, and the morning frosts in exposed situations have done great damage, so much so that they can only be reckoned at a good half-crop. Apples blossomed well in some districts, in others not so well. Where growers have washed their trees, they will no doubt save the bulk of the crop; but in many districts where they have not washed them, the trees are attacked by vermin, and the crop (if any) must be a very poor one. On the whole, we think the crop can be reckoned at barely one-half.

FRANCE.—Crops generally, in the early part of May, looked very favourable indeed. Since then they have had a continuation of very cold, wet weather, and early Cherries have suffered severely. On the other hand, Apples in the south are said to be good crops; Plums and Green Gages half a crop. In the north,

Black Currants are only half a crop. Cherries are fairly good; but of stone fruit (Plums and Green Gages), it is stated that the oldest inhabitant never knew the crop to be so bad as it is this year. Pears are a fair crop. Apples look fairly good.

BELGIUM.—Reports from Ghent, Ostend, Maestricht, Slidinge, and Namur, speak of—Cherries from a quarter to one-third of a crop; Green Gages and Plums only a quarter crop; early Pears half a crop; late Pears a fair crop; Apples are said to look well, with every prospect of a fair crop; although reports from one or two districts during the past few days speak of Pears and Apples being attacked by vermin.

HOLLAND.—Crops of fruit have suffered much from late frosts during May, particularly Cherries, Gooseberries, and Pears. In the district of Guelderland particularly, the fruit has received much damage from "hail-storms." Gooseberries and Currants are said to be a fair half crop. Cherries are not more than one-third of a crop. Pears one-third of a crop, and Apples fairly good. Plums are a small crop.

GERMANY.—Owing to the mild spring, crops are forward, and fruit from the Rhine districts promised to be most plentiful; but the weather in May has affected these also, and they have been attacked by vermin; so much so, that Apples are now said to be a bad crop, and Cherries only half a crop. Plums a bad crop.

Taking these reports as a whole, it will be seen that—Cherries are bad all round; Plums are very short; and for Pears, England will have to depend upon foreign countries for supplies. It would, therefore, appear that on account of their scarcity, all kinds of soft fruit in good condition will meet with a profitable market. *W. N. White & Co., Limited.*

MR. JOHN CHEAL, senior member of the firm of J. CHEAL & SONS, Lowfield Nurseries, Crawley, Sussex, attained his 50th birthday on Saturday last, June 7. A handsome brass lamp and an illuminated address of congratulation were presented by the *employés* who were given an outing to Brighton on Monday.

MESSRS. SUTTON AND SONS, READING. The *employés* of the above firm, to the number of 500, were given an outing on Tuesday, the 10th inst., Bournemouth being the place visited. A special train conveyed the party to its destination.

MARSDENIA ERECTA.

THIS is an interesting member of the order Asclepiadaceæ, met with occasionally in botanical gardens, and worthy of more general cultivation. The plant (see fig. 125) is a semi-scandent bush, with foliage similar to that of *Syringa vulgaris*, but of a blue-green colour. The flowers are white, sweet-scented, and numerous, in umbel-formed cymes, and appear in July. It is half-hardy in this country. It was collected on Mount Olympus by M. Peters, collector in the service of the National Arboretum, Zieschen-Merseburg, who sent seeds of the plant to the director, Dr. G. Dieck, who has kindly furnished us with an illustration of it.

HOME CORRESPONDENCE.

CHOU DE BURGHLEY. I must make some slight apology to Mr. Gilbert for not making my meaning clearer (p. 617) with regard to the two vegetables, Savoy Cabbage and Chou de Burghley. My words read thus:—"For a succession, a sowing of the above should be made, and in many instances the produce will be found more serviceable than the larger heads from the earlier raised plants, which, if not cut when ready, split and rot." I think no man knows better than Mr. Gilbert that too early and full-grown Savoys and Cabbages, as soon as the autumn rains and fogs set in, are subject, more or less, to the evil of splitting, and soon become almost useless, and that medium heads or hearts are the best, and the most useful for meeting a large demand throughout the winter and spring months. And I would here remind Mr. Gilbert that I never write without having first, by repeated experiment, proved the truth of what I state; and although I do not remember to have seen the head of a true Chou split, I have had plants which were early planted, which, by the middle of the month of October, had become fine solid stuff, and in November the outer leaves began

to burst asunder, allowing moisture to enter; and when this happens a few degrees of frost will cause much of the outside to rot. I have proved the value of Chou de Burghley, when planted out later, as a vegetable in use in February and March, and it is for such late use that I specially recommended a late sowing of it. *H. Markham.*

HARDY SHRUBS AND FLOWERING TREES.—I was pleased to see flowering shrubs and trees were in recent issues of the *Gardeners' Chronicle* brought before the notice of your readers. There are so many beautiful evergreen and deciduous plants which, if they were planted more freely than is usual, would give in nearly every month something of interest in the garden. I enclose you a portion of a spray of *Viburnum plicatum*, which very few people hereabout seem to know. This plant, according to Nicholson's *Dictionary of Gardening*, was introduced so long ago as 1846, but it is yet rare in gardens. Our plant grows in a corner at my front door, facing south, and it is nearly 5 feet high and 2 feet in diameter. A fortnight since I counted 145 flower-heads upon it similar to those sent for your inspection. *R. Morris.* [*Viburnum plicatum* is a great improvement on the common Snowball, *V. opulus*. The white is what is known as French white. Ed.]

LATHYRUS SIBTHORPI.—In connection with Mr. Baker's description of this plant on p. 704, may I call attention to Sweet's *English Flower Garden*, series ii., t. 333, which is a portrait of a variety of *L. rotundifolius* bearing a strong resemblance to the plant cultivated by Mr. Archer Hind. I know Mr. Archer Hind's plant well, as he has given it to me twice, and it has died after a year or two, seeming less hardy than the type. It sent me a fine flowering piece last week, which I compared with the figure in Sweet, and it seemed to agree. Sweet's figure was published in 1838, being taken from a plant in the Birmingham Botanic Garden. The description is by Don, but the name (var. elliptica) and characters are copied from De Candolle, *Prodr.*, vol. ii., p. 370, who gives them from a specimen found by M. Boberstein in Georgia. As regards the European distribution of *L. rotundifolius*, I observe that the botanist Janka, says that it is found near Klausenburg in Transylvania; this is the only habitat given westward of the Carpathian range. It seems not improbable that the form *L. Sibthorpii* has been in cultivation in England longer than the type *L. rotundifolius*. No mention is made of either in Miller's *Dictionary*, published in 1807. London's *Encyclopædia* gives 1822 as the date of the introduction of *L. rotundifolius*. In Maund's *Botanical Treasury*, vol. vi. (1873), I find *L. rotundifolius* figured with elliptical leaves. It is described as "very little known, but has long been cultivated in the Oxford Botanic Garden, to which it is supposed to have been introduced by Dr. Sibthorpe." Now Sibthorpe died in 1796, so that its introduction must have been before that date. *C. Wally Doll, Edge Hall, Malpas.*

WATERLOO PEACH, ETC.—When a very early Peach is required, this is, in my opinion, the best we have. Just recently, in looking through the well-kept gardens of Mereworth Castle, I was very much pleased to see how well Mr. Markham does it. This variety is generally thought to be rather small, and of very poor flavour. No doubt it is rather deficient in the latter respect, but as for size—well, most of the fruit turned the scales at 8 oz., quite large enough for general purposes, whilst the colour is most beautiful. Growing in the same house is a Grosse Mignonne, which has only just commenced to stone. This house was closed on February 15, and ripe Peaches of Waterloo were gathered on May 17, and with but very little forcing. The later houses, both of Grapes and Peaches, are looking remarkably well; and as for the Strawberries, when I saw them they were really grand, both in colour and size, principally Sir C. Napier. *G. W., Barkham Court Gardens, Maidstone.*

FIELD ESCAPES.—In our little garden here (Beigate), we cherish what we call our three field escapes, although the first to be mentioned is a very doubtful native. The first time I saw the greater Celandine in our garden, waving its pretty, artistically cleft leaves, starred with golden flowers (not dreaming of a weed being cultivated), in the distance, I mistook it for the *Stylophorum*. The plants are growing in the shade of trees, which position seems, judging from their vigour and health, to be exactly

suited to them, and not only in the distance, but at close quarters, presented a graceful and beautiful picture. The first feature of the plant is the foliage, indeed, in this respect, the Celandine will bear comparison with most so-called garden flowers. Growing near is some London Pride, and the two coalesce well together. No one will ever regret planting any of the shaded spots and angles of the shrubbery or garden, so often left to take care of themselves, with this plant. It is even worthy of a better place. Our other two wild flowers are the Enchanter's Nightshade and the Henbane. The former must be kept in due bounds, as its spreading powers are very troublesome, but one or two are quite pretty enough to be allowed to remain. The Henbane (*Hyoscyamus*), is a very interesting and curious plant, and gives one many problems to think out the reason for, in its thickly plated hairs, in the viscid exudations, and in the purple veins, which reticulate the lurid yellow petals. *C. A. M. Carmichael.*

COLOURED POTATOS.—Last spring I received an application for some of the Jersey Blue Potato. It was as if I had been asked to supply Tom Thumb scarlet Pelargonium. Remains of each may still exist somewhere in the country, but only as curiosities. I doubt whether the Potato is to be found in commerce; if it is, it must be where Potato culture has become fossilised. What a revolution has there been in Potatoes since the day when Jersey Blue was a popular variety. Those were not exactly halcyon days for Potato growers, because the kinds then in cultivation were none too productive, and some of very indifferent quality; still, there was an advantage to growers in the fact that, because of the comparative paucity of sorts, it was not difficult to make a selection from the lists. Of late we have heard complaints of the difficulty experienced in making selections from so many. Mr. Fidler, of Reading, who grows for the convenience of the trade, probably has more varieties of Potatoes than anyone else, offers a selection of some 150 sorts, but our fathers in the days of Jersey Blues got along with a dozen. The time came, however, in 1845, when the dozen sorts were nearly all destroyed. The growers of that day fought against the new, terrible, and insidious disease, as best they could, but it was a very unequal fight, and if many fine new sorts of some considerable disease-resisting power had not come to the rescue, the state of our Potato crops to-day might have been bad indeed. Thanks to the new robust sorts, we have such a wealth of Potatoes for eating and for planting this spring, that any quantity may be purchased at from 40s. to 60s. per ton. Rates which it would seem cannot possibly compensate the grower; with Jersey Blue, of coloured Potatoes, the best known of fifty years ago were Fortyfold and Lancashire Kidney. The former of these had a fairly long lease of life, and was of its kind first-rate. It was, however, a moderate grower and cropper, and was well nigh extinguished in the fight with the terrible *Peronospora*. Coloured Potatoes have never held other than a secondary place in the market, and have, as compared with white ones, been but moderately grown; we have never had, probably never shall again have, two such popular coloured sorts as Reading Russet, red round, and Vicar of Lechlair, purple round, both first-class and abundant croppers; but neither have got into market quotations. Had they been white sorts they would have found a place there long since. We have never found a white counterpart of the Vicar. Both these varieties were grown in almost every part of the kingdom, and are now not much in request from the trade grower. For a long time Early Rose, the original American variety, was popular in market, the pale red hue of its skin being overlooked, because the variety was so early and prolific. But presently there came, also from America, Beauty of Hebron, which has a very pale pink skin, and that popular variety has clipped the wings of the Rose. The Beauty is now being displaced by its white-skinned form, so that it looked as if even pale red-skinned Potatoes would soon be quite excluded from market sale. The market objection is of a very matter-of-fact kind. Still it appears to be a very absurd one; and there seems to be no probability that it will change. Apart from Hebrons, the chief sorts in market now are Regents, still largely grown in the north, but presumably seedlings from the old strains, Magnum Bonum, Champions, and Imperators, all white skinned and very robust growers. The latter two are exceptionally coarse growers and eaters, and grown so largely because bulk must be made to compensate for lowness of price. Since the International and other

Potato Shows have fallen through, there is very little demand for coloured Potatoes of any sorts generally. That the prejudice against coloured skins is not confined to the market, is evident, as otherwise many very fine sorts, having coloured skins, would still be grown in gardens; we have probably seen the best days of Potato exhibitions, and the demand for numerous varieties will possibly never be renewed. To raise even the finest of coloured forms is but to reap disappointment, no one caring to purchase them. I doubt whether we can hope to excel in quality or form as well as of cropping capacities, some of the coloured varieties still to be had if enquired for; therefore, apart from the general lack of interest in coloured tubers, there is little present need for creating new varieties. Even in the case of the finest of the whites, whether round or kidney, with tons by hundreds selling at 50s., what hope is there that novelties will attract attention. If the disease were to make almost a clean sweep of existing sorts, then some demand for new ones would arise; but such a disaster is widely improbable, whilst we have at once such robust heavy cropping varieties, and the disease appears in so comparatively mild a form annually, that nothing seems to concern Potato growers so little as harm to their crops from disease, whilst raisers are finding their occupation gone. *A. D.*

PRESIDENT STRAWBERRY.—May I write once more in praise of this old variety of Strawberry? Here we have grown it for successful crops during the last sixteen years, without being once disappointed with it; and where the soil suits it, as is the case at Hendre, but which is not the case at Mereworth, as Mr. Markham testifies, it will be difficult to supplant as a forcer. We usually reduce the fruits to nine or ten on a plant; half of these more or less develop to the size of those accompanying this note, while the remainder are somewhat smaller; and seeing that time and labour for special treatment cannot be afforded the plants, these results, although not remarkable, are nevertheless satisfactory, as the result of ordinary treatment. *Thomas Coomber.* [Very nice, cockscomb-shaped fruits of this fine-flavoured, bright-coloured variety. The plant is very robust, and a profuse bearer, and in soils suitable to it there are few better varieties. *En.*]

THE COMMISSIONERS OF 1852 EXHIBITION AND THE ROYAL HORTICULTURAL SOCIETY.—In a paper circulated at the great Temple Show are these words:—"With the Prince President seems to have passed away, gradually also, as far as our Society is concerned, the Commissioners' friendliness." This is unjust to the memory of my old friend, General Scott, who was one of the truest friends the Society has ever had, and as he was at one time both Secretary to Her Majesty's Commissioners, and also to the Society. An influential one, it is too long a question to be gone into now. In 1874, I published a pamphlet on *The Royal Horticultural Society as it is, and as it might be.* I ever get time to continue the story, it will be seen that something can be said on Her Majesty's Commissioners' side of the question. *George F. Wilson.*

THE LIFE-HISTORY OF ÆCIDIDIUM GLABRUM.—In the *Gardeners' Chronicle* for May 31, I drew attention to the fact that this pretty little Æcidium, which occurs on *Glauca maritima*, is heterocarpous, and that its other conditions are to be found in an *Uromyces*, which occurs on *Scirpus maritimus*, and to which I then applied the name, *U. maritima*. This *Uromyces* is a very inconspicuous fungus, the spore beds being very minute, and are often placed upon the discoloured spots so common on the old leaves of *Scirpus*, but that it is very easily overlooked. It is, however, more observable when the host plant is damp. The spores, too, are remarkable in form, being more like *Puccinia* spores in shape, but without any septum. Material gathered at Paul, near Hull, in August, 1889, germinated in April, and as I have before shown, produced the Æcidium on *Glauca maritima* during the month of May. From the Æcidium thus developed, spores were taken and applied to a healthy plant of *Scirpus*, and in thirteen days mature Uredospores were gathered. Subjoined is the description of the three spore-forms of this fungus:—

Uromyces maritima, n. sp.—Acidospores pseudo-peridial irregularly scattered on the leaves, sometimes circinating on the stems, causing elongated swollen distortions, shortly cylindrical, with torn white edges; spores sub-globose, epispore echinulate, colourless; contents pale yellow, 20–25 μ .

Uredospores.—Sori small, dark brownish-black, linear or rounded, sometimes confluent, in the later stages often occurring on brownish discoloured spots, at first covered, then opened by the longitudinal splitting of the epidermis; spores sub-globose, ovate or pyriform, brown; epispore finely echinulate, 20–25 \times 28–32 μ . Stray spores attain a diameter of 40 μ .

Teliospores.—Sori minute, oval, elongate, or linear, black, covered by the epidermis when dry, but exposed when moist; spores brown, smooth, fusiform or elliptico-fusiform; apex slightly thickened, acuminate, rarely rounded, 40–50 \times 15–20 μ ; pedicels pale brown, persistent.

The acidospores occur on *Glauca maritima* (= *Acidia glauca*, D. and M.), the uredo and teliospores on *Scirpus maritimus*. *Charles E. Plowright, Cleethorpes.*

ÆONIA BROWNII.—This rare species, introduced by the Royal Horticultural Society's collector David Douglas, was found by him near the snow line on Mount Hood, N. W. America. All of the plants which the Society gave away speedily died; but the plants kept in the gardens at Chiswick thrive in a mixture of peat, a small portion of loam, and silver sand, more than one half of the mixture being sand. It was kept in a northern aspect, so that the sun shone on the plant for a few hours only in summer time. The plant was also covered at that season with a hand-glass to keep the soil and roots in a rather dry state. It is a very distinct and singular dwarf-growing plant, but it cannot withstand bright sunshine in summer, and all the plants exposed to it died. This plant flowered and was figured in the *Botanical Register*, t. 30, for the year 1839. The above hints may be useful to those who are trying to grow this plant. Mr. Peter Barr has it, or did have it in his collection, and if he has successfully cultivated it he would gratify some of the readers of the *Gardeners' Chronicle* by explaining to them how he has done it. *J. Douglas.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, June 10.—The Drill Hall on the above occasion was gay with hardy flowers, as *Pæonies*, *Delphiniums*, *Shirley Poppies*, *Irises*, *Orchids* (a few), and *Pelargoniums*; and but for the rain, which fell heavily in the afternoon, it would have been much visited by the public.

At 3 o'clock, Mr. G. Paul commenced the reading of his paper on "The History and Culture of the *Pæony*;" and was followed by the more scientific account of the various species by Mr. J. H. Lynch, of Cambridge Botanical Gardens. Both gentlemen were listened to by an attentive and appreciative audience.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. H. Herbst, T. Baines, K. Dean, J. Walker, T. W. Girdlestone, H. B. May, H. Cannell, B. Wynne, H. Turner, C. Noble, J. Fraser, G. Paul, H. H. D'Ombraim, W. Holmes, G. Nicholson, and F. Koss.

A Silver Challenge Cup was offered for a collection of herbaceous *Pæonies* from an amateur, the Rev. W. Wilks, Shirley Vicarage, Croydon, receiving the prize for a nicely-grown lot, without any competition; the rich red double-flowered officinalis was very showy, and the following varieties also:—*corallina*, *Victoria Modeste*, *alba maxima albiflora*, *Ceres*, and *Anemoneflora*.

Messrs. Kelway & Son sent from their nurseries at Langport, Somerset, a collection of cut flowers, which occupied almost the whole of one side of the Drill Hall. Varieties of herbaceous *Pæonies* formed the chief feature, and made a brilliant show of colour, some of the most noteworthy being *Sainfoin*, bright rose double, the flower large and solid; *James Kelway*, soft pink double; *Raphael*, rich cherry double; *Princess Mary*, creamy-white double; *Queen Victoria*, cream centre, with yellow guards; *Snow Queen*, pure white; *Duchess of Teck*, very full yellow centre, with rose guards; *Duke of Clarence*, a fine double flower of good depth, and elegantly curled petals, soft pink flush on cream; *Lady Leonora* Bramwell, rose-pink double—a large strong flower. Of the single varieties, which were not so numerous as the double, the best were:—

Stanley, deep maroon-crimson; *Dorothy Tennant*, soft pink, shaded off to white; *Duchess of Fife*, large and bright cherry-rose; and *Julia Kelway*, rose flush on white—a finely formed flower. There were several varieties of *Pyrethrum*, both single and double. *Mary Kelway* was a very good white single of large size, and *Aphrodite* a good double white; in King Oscar is a fine double flower of carmine-lake, while *Alfred Kelway* is similar, but darker still; *Florentine* is a rosy-lilac double of large size. *Amaryllis* were also plentiful. *Ernest Kelway*, bright scarlet; and *Maria Kelway*, white, with carmine ribs, were good. The display was finished off by small lots of *Irises* and *Delphiniums*, among the latter being a large-flowered variety named *Alfred Kelway*, the spike solid and long.

An interesting collection of *Sarracenia*s was contributed by Messrs. E. S. Williams & Son, Upper Holloway, N.; they were all well-grown examples, and specimens of *S. purpurea* received a good share of notice, other good specimens being seen in *Mitchelliana*, *Paterosini*, *Wilsoni*, and *Chelsoana*. In this group were also a plant shown as *Arisema filiformis*, which had a spathe of dull green, marbled with brown—a very elegant-looking object; *Berolonias*, including one named *Souvenir de Gand*, being very attractive, the leaf-colours being rich lilac-crimson on a dull green ground; and an ornamental-leaved *Begonia Louise Closson*, the leaves dull dark crimson, with blotches of a lighter hue.

Hybrid *Roses*, the results of crossing our garden *Roses* with the Sweet Briar, were shown by Lord Penzance, and some of the results obtained were very pleasing, particularly the progeny from a cross with the H. P. *La Souveraine*, which yields a large single flower, 3 inches across, of bright rose, and a white eye. A cross with *Harrisoni* produced a flower of yellow, with a pale brown flush; very distinct, and having the Briar scent. The Musk Rose crossed with the Moss Rose *Celina*, gives a plant producing clusters of double flowers of dull crimson, and having a very peculiar odour.

Messrs. W. Paul & Son, Old Nurseries, Cheshunt, staged a nice lot of cut blooms of herbaceous *Pæonies*, showing several excellent varieties. *Nannie* grows to a height of 2 feet only, and the flower is large, rosy-flesh, and full; the dwarf habit should render it a very useful variety. A collection of cut herbaceous plants was also sent—*Thalictrum*, *Potentilla*, *Shirley Poppies*, *Irish Juncea* major, *Erigeron uniflorus*, *Achillea monogolica*, pure white—very pretty; and *Xerophyllum asphodeloides*, a pretty little liliaceous plant, carrying its small cream-coloured flowers in a dense spike.

Nymphaea zanzibarensis, a flower of very large size, and a rich deep mauve-blue colour, together with *Pachira insignis*, with large flowers of yellowish-brown; and *Solanum Wendlandi*, with numerous flowers of mauve—a very decorative plant—were shown from the Royal Gardens, Kew.

Crimum brachynema, pure white, was sent by Mr. J. Smith, Mentmore Gardens, Leighton Buzzard; a peculiar feature is that the stamens close up the tubes of the flowers, which are borne in a good-sized head of about a dozen flowers, and the whole plant is about 2½ feet high.

A large-flowered *Lobelia* of the purest white—a very good variety, was shown by Mr. J. Witney, Tarvee, Beds.

O. T. Hodges, Esq., Chislehurst, showed a well-flowered specimen of *Saxifraga longifolia*.

Miss Harris, The Grange, Lamberhurst, sent a collection of varieties of *Colombine*, in a number of pleasing combinations of colours, and very elegantly set up for exhibition.

Messrs. J. Veitch & Sons, Chelsea, S.W., sent a collection of *Hydrangeas*, finely grown, and especially noticeable were *hortensis mancharica*, *rosea*, and *stellata* d.-pl. From the open air came flowering pieces of *Rogersia podophylla* with panicles of yellowish flowers, and *Bomaria multiflora*; a number of plants of *Primula sikkimensis* were also sent.

A small collection of *Aquilegia*s and *Iris* came from the nurseries of Messrs. J. Veitch & Sons, Chelsea, also a boxful of cut blooms of the showy *Hemerocallis flava*, another of a dark blue *Delphinium*, some single spikes of *D. minerva*, a dense long spike of cobalt blue, double flowers; *D. Chancellor*, dark blue; several *Pyrethrum roseum* in variety, *Phlox ovata*, &c.

Roses were shown by Mr. G. Prince, of Oxford, who had a fine lot of *Princess of Wales*, while, among other noteworthy blooms, were *Maréchal Niel*, *Comtesse de Nadailac*, *Souvenir d'un Ami*, *Souvenir de S. A. Prince*, *Adam*, and *Souvenir*

d'Elise Vardon. Mr. Eckford, Wem, sent blooms of fancy Pansies, and Messrs. Clibran & Sons, Altrincham, sent three seedling Ferns, a *Pteris serrulata* var. with reduced pinnae; *P. cretica*, crested; and a *Gymnogramma*, with the pinnae irregularly reduced to the mid-rib.

A most interesting collection, thirty-six varieties, of Iviess was shown by Messrs. W. Cutbush & Son, of Highgate. The arboreal and variegated varieties of *Hedera rhombica*, and the various variegated forms of other varieties were conspicuous. Messrs. P. Barr & Sons, King Street, Covent Garden, had a very full collection of Iriesses, including the species and varieties of *I. squaleus*, *I. pallida*, *I. variegata*, *I. neglecta*, and *I. amena*. In *I. pallida* we may note *I. Walner*, of deep blue and purple; *I. p. Astarte*, blue and purple; *I. p. Dalmatian*, pale blue; *I. p. Garibaldi*, rosy-purple; in *I. variegata* Mrs. Barron, rich yellow standards and striped purple falls; *I. v. Prince* of Orange, chiefly of two shades of orange; *I. v. Ada*, similar to Mrs. Barron but less good; *I. amena Victorina*, white standards flaked with purple, and falls dark velvety blue purple; *I. a. Mrs. H. Darwin* is white with purple stripes on the falls.

Mr. S. Barlow, Stakehill, Manchester, exhibited breeder show Tulips, and breaks in course of development, and perfect flowers, bizarres and hybridisms. White Perfection *Viola*, pure in colour, and a profuse bloomer, good for bedding, came from Mr. R. Dean, Ealing; also *Viola Snowflake*, in the same way, and equally valuable as a white bedder; *Cleome integrifolia*, a hardly annual with purple flowers in terminal corymbs; *Gaillardia aristata*, yellow, with brown disc.

Orchid Committee.

Present: Sir T. Lawrence, Bart., M.P., in the chair; and Messrs. De B. Crawshaw, H. M. Pollett, H. Ballantine, J. Doiny, C. Pilcher, E. Hill, F. Sander, L. Castle, A. H. Smece, H. J. Veitch, and J. O'Brien.

Messrs. B. S. Williams & Son, Upper Holloway, N., sent *Cattleya Mossie decora*, rosy-mauve, with a broad lip, the margin pale lilac, the tips of the petals having a line of crimson; also *Odontoglossum crispum plumatum*, the petals and sepals having, besides the spots, a feathery line of pale rose parallel with the margin.

petals and sepals of pure white—very elegant, were sent by Mr. Ballantine, gr. to Baron Schroder, The Dell, Egham.

From C. S. Cook, Esq., Kingston Hill, Surrey (gr. M. D. Cullimore), came a fine *Cattleya Warneri*, with a very deeply-coloured lip, and also a good piece of *Cattleya imbricata maculata*.

From Messrs. Sander & Co., St. Albans, was a pretty lot of well-grown plants, including *Bate-mania Wallisi*, with a very striking flower. The central area is white, then the outer portions of all the parts, including the lip, are rich brown, with a netting of darker brown; at the base of the petal there is a dark purple spot on the white ground; other plants were *Dendrobium MacCarthei*, *D. thysiflorum*, *Miltonia vexillaria*, &c.

A specimen of *Cattleya intermedia* var. *Parthenia* was sent by Sir Trevor Lawrence, Burford Lodge, Dorking, the flowers are in all parts of snowy whiteness, and the plant was very attractive.

An *Odontoglossum Pescatorei*, a very showy variety, named Tilgate var., with richly coloured spots on the petals and sepals, came from J. H. Nix, Esq., Crawley (Mr. R. Young, gr.). Mr. W. H. Young, gr. to F. Wigan, Clare Lawn, East Sheen, contributed a beautiful and large flowered *Phalænopsis grandiflora*.

Mr. Studd, Bath (gr. Mr. Cypher), sent *Sobralia macrantha rosea*, with flowers of soft-shaded rose. The rare white-flowered *Odontoglossum Galeottianum* was sent by T. Statter, Esq., Whitfield, Manchester. Mr. Rann, gr. to J. Larkin, Esq., High-bury New Park, N., sent a finely flowered *Odontoglossum cristatellum*, with seven spikes. Mr. Wythes, Syon House, Brentford, had *Oncidium sphecelatum*. Sir W. H. S. Marriott, Bart., Down House, Blandford, sent *Laelio-Cattleya Marriottii* (C. Mossia \times L. purpurata), in which the lip of the Laelia was prominent; and Messrs. J. Veitch & Sons, Chelsea, had the new *Dendrobium lineale*, a lax spike of flowers, 18 inches long, the flowers white with a lip of violet-mauve.

Fruit Committee.

Present: Sir C. W. Strickland, Bart., in the chair; and Messrs. J. Lee, T. F. Rivers, P. Crowley, R. D. Blackmore, G. W. Cummins, G. Bunyard, R. Balder-son, F. Q. Lane, and J. Cheal.

From the Society's Gardens came plants of early Strawberries, showing that Crescent Seedling was the earliest of all. Mr. Rivers, Sawbridgeworth, sent samples of Cherries Early Rivers and Belle d'Orleans. Mr. J. Smith, Mentmore, Leighton Buzzard, sent ripe fruits of Strawberry A. F. Barron. Seedling Melons were shown, and from Mr. J. F. Pascoe, Adelaide, South Australia, came five varieties of Apples shipped per Smith, Elder & Co. They were in very fine condition.

The following are the awards:—

BY THE FLORAL COMMITTEE.

First-class Certificates.

- To Lord Penzance, for Sweet Briar.
- To Messrs. B. S. Williams & Son, for *Bertolonia Souvenir de Gand*.
- To Mr. J. Smith, for *Crinum brachynema*.

Awards of Merit.

- To Mr. J. Witney, for *Lobelia Reine Blanche*.
- To Messrs. Paul & Son, for *Xerophyllum Asphodeloides*.
- To Messrs. Paul & Son, for *Achillea mongolica*.
- To Messrs. H. Cannell, for *Begonia Golden Queen*.
- To Messrs. H. Cannell, for *Gloxinia Agnes Cook*.
- To Messrs. J. Laing, for *Begonia Black Douglas*.
- To Messrs. J. Laing, for *Melano Pfitzer*.
- To Messrs. Kelway & Son, for *Peony Stanley*.
- To Messrs. Kelway & Son, for *Peony Sainfoin*.
- To Messrs. Kelway & Son, for *Peony Princess Mary*.
- To Messrs. Kelway & Son, for *Peony Duchess of Teck*.
- To Messrs. Kelway & Son, for *Delphinium Alfred Kelway*.

Silver Gilt Flora Medal.

- To Messrs. Kelway & Son, for *Paeonies*.

Silver Banksian Medal.

- To Messrs. Paul & Son, for cut flowers.

Bronze Banksian Medals.

- To Messrs. B. S. Williams, for *Sarcocollis*.
- To Messrs. W. Cutbush, for *Iviess*.

FIG. 125.—MARSIPPIA ERIOCTA. (SEE P. 745.)

Messrs. J. Laing & Sons, exhibited a few very choice double-tuberous *Begonias*, showing advances in the direction of a stronger flower-stalk, and consequently more horizontal poise of the blooms. These were Viscount Wolsely, Sanset, Madame Pfitzer, and Black Douglas, flower in all cases large and double, and of distinct colours.

A number of plants of a tuberous *Begonia* with narrow acutely-pointed leaves, mottled with green, pink, and white, were shown by Mr. B. R. Davis, Yeovil Nursery, Yeovil. In the young stages the leaves are very striking and pretty.

Some varieties of *Paeonia albiflora*, white, rose, and purple, came from Messrs. T. Ware & Son, Tottenham.

From the Home of Flowers, Swanley, Messrs. H. Cannell & Sons, were some large blooms of *Aristolochia ornithocphala*; grand trusses of show, fancy, and decorative *Pelargoniums*, the edged flowers Ledebour, Black Diamond, President Harrison, and Lily Cannell, being distinct and good florists varieties. Some double-flowered *Begonias* were also shown; *Exquisite*, Miss Fawcett, Golden Queen, Lady Palestone, W. H. Lincoln, and A. Blanc being very fine varieties, with distinct and pleasing colours. *Pelargonium zonal* M. V. Noulens is a flower of bright shrimp-pink, with a small amount of white on the petals. It is good in its class.

One of the most attractive specimens was a hybrid (*Cypripedium*, stated to be (*niveum* \times *ciliolare*), shown by Mr. Avling, gr. to J. Hollington, Esq., Forty Hill, Enfield. The flower was about 5 inches across, the ground colour pure white, wide lines and dots of rose-crimson on the downy oblong petals, and reflexed dorsal sepal, the lip being quite white; the staminate is that of *ciliolare*, but paler. One peculiar feature is that the lower sepal in the hybrid is almost as large as the dorsal one. The flower is a very elegant novelty.

C. L. N. Ingram, Esq., Elstead House, Godalming, Surrey (gr. Mr. Bond), sent plants of *Cattleya Eisteddiana* (*Laelia purpurata* \times *Cattleya Mossia*); also a *C. Mendelii*, with a richly-coloured lip and tipped petals.

A. H. Smece, Esq., The Grange Gardens, Wallington (gr. Mr. Cummins), sent a fine form of *Cattleya Mendelii*, Alfred Smece, the petals very broad, lilac-rose; the lip flat and expanding, with a very undulating edge, the crimson being confined to the point, on account of the white areas being much larger, and coming more forward than usual. In *C. Mossia* Mrs. Smece, the yellow of the throat was produced far on to the lip, which measured about 2½ inches in length; a fine form of *Phalænopsis speciosa* was also sent.

Phaius Humbloti and var. *alba*, the latter having

To Mr. G. Prince, for *Roses*.
To Messrs. Cannell, for *Pelargoniums*.
To Mr. S. Barlow, for *Tulips*.

BY THE ORCHID COMMITTEE.

First-class Certificates.

To *Phaius Humblotii* alba, from Baron Schroder.
To *Batemannia Wallisii*, from Messrs. Sauder & Co.
To *Cypripedium* seedling *C. niveum*, from Mr. C. J. Hollington.
To *Sobralia macrantha* var. *rosea*, from Mrs. Studd.
To *Cattleya intermedia* Parthenia, from Sir T. Lawrence.

Awards of Merit.

To *Odontoglossum Galeottianum*, from T. Statter, Esq.
To *Cattleya Warneri*, from M. S. Cook, Esq.
To *Odontoglossum Pescatorei* Tilgate var., from J. W. Nix, Esq.
To *Cattleya Mendelii* Alfred Smea, from A. H. Smea, Esq.

ROYAL BOTANIC.

JUNE 11.—The Royal Botanic Society, having been favoured with fine weather for the three flower shows previously held, was fated to experience very stormy weather on the occasion of their second summer show on the above date. Torrents of rain fell at the time the exhibition was opened to visitors, and the gravelled walks were almost too soddened to walk upon. It was in many respects a pretty and bright exhibition, but it was at the same time weak in some features; and if the specimen stove and greenhouse plants staged in the various classes had to be taken as representing the best grown in the neighbourhood of London, then the culture of this class of plants has fallen to a very low ebb indeed, for, with the exception of a few decent plants from Handcross Park, these were very poor.

In the open class for twelve specimens, Mr. J. F. Mould, nurseryman, Lewsey, was 1st; in the amateur's class for six, Mr. Offer, gr. to J. Warren, Esq., Handcross Park, Crawley, was 1st; and in that for six, open only to nurserymen, Mr. Mould was again 1st. One lot of six plants, in class 2, were unworthy of being staged, and it is a great pity that they were awarded a 2nd prize.

Orchids.—There was but one collection of twelve in the amateur's class—a superb lot, from Mr. Willians, gr. to His Grace the Duke of Marlborough, Blenheim Park, Woodstock, all even, fresh, grandly bloomed, and admirably matched. They consisted of *Cattleya gigas* Sanderiana, C. Mossie, C. Mendelii, C. Warneri, *Disa grandiflora*, *Laelia purpurata*, *Cypripedium calceolatum*, C. *barbatum*, *Dendrobium Dearii*, *Anguloa Cloesii*, *Epidendrum prismatocarpum*, and *E. vitellinum*.

Mr. J. James, nurseryman, Lower Norwood, was the only exhibitor in the class for twelve plants, having three varieties of *Cypripedium barbatum*, *Cattleya Warneri*, C. *Mendelii*, &c.

In the amateurs' class for a collection, Mr. J. Douglas, gr. to Mrs. Whitbourne, Great Gearies, Hford, was 1st, with good pieces of *Cypripediums*, *Cattleyas*, *Odontoglossums*, including a fine piece of *O. Roehliabum*, and *Miltonia vexillarium*; but, despite the imperative rule to the contrary, the *Orchids* and most of Mr. Douglas's exhibits, were unnamed. Mr. A. Howard, gr. to H. Little, Esq., Baronshalt, Twickenham, was 2nd.

Pelargoniums.—Some good specimens of large-flowered *Pelargoniums* were shown by Mr. C. Turner, Royal Nursery, Slough—*Goldmine*, *Illuminator*, *Outlaw*, and *Sister of Mercy* being of the best quality.

In the amateurs' class, Mr. D. Phillips, Langley Broom, Slough, was 1st, and these exhibitors occupied similar positions in the two classes for six fancy *Pelargoniums*. Some very well-grown and flowered zonal *Pelargoniums* were shown by Mr. D. Phillips, Mr. Howard coming a good 2nd.

Tuberous Leguminosae.—Mr. Howard was awarded the 1st prize for a very good collection of twelve plants, well grown and bloomed.

Fuchsia Plants.—The only collection of *Nepenthes* and *Sarracenias*, and that a good representative one, came from Messrs. B. Peed & Sons, Roupell Park, Brixton.

Endic Ferns were a good feature. Mr. Offer had the best six, consisting of fine specimens of *Cyathia medullaris*, C. *Smithii*, *Cibotium Scheidei*, *Davallia Mooreana*, *Dicksonia squarrosa*, and *Alsophila australis*; Mr. J. Ford, gr. to Sir C. Pigott, Wexham

Park, Slough, was 2nd, having fine plants of golden and silver *Gymnogrammas*, and a huge plant of *Adiantum decorum*. The only exhibitor of a collection of European Ferns was Mr. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan's, Regent's Park.

Foliaged Plants.—A very fine collection of six came from Mr. Offer, and consisted of very fine examples of *Cycas revoluta*, C. *circinalis*, *Eucalyptus villosus*, *Croton Warrentii*, C. *angustifolius*, and *Dasylirotum acrotichum*; Mr. Ford was 2nd. Mr. H. James had the best six in the nurseryman's class, Mr. J. F. Mould was 2nd.

A fine lot of six *Palms* came from Mr. Offer, consisting of *Kentia canterburyana*, K. *australis*, *Latania borbonica*, *Thrinax elegans*, *Pritchardia pacifica*, and *Pheniceophorum sechellarum*; Mr. H. James was 2nd, also with large specimens. Mr. Offer had the best six variegated-leaved plants, an even lot of bright looking subjects, his best specimens being *Croton picturatus*, C. *Mortii*, *Dieffenbachia magnifica*, and *Alocasia Veitchii*; Mr. H. James was 2nd, having *Dieffenbachia Jenmani*, and a well coloured *Dracaena Lindenii*.

Cut Flowers.—In these classes some excellent *Roses* were shown. The best twelve, three trusses of each, came from Mr. Robins, gr. to E. D. Lee, Esq., Hartwell Park, Aylesbury, who had very fine examples of *Catherine Mermet*, *Marchal* Nil. *Devoniensis*, *Gloria de Dijon*, *Adam*, &c. Colonel T. H. Pitt, Turkey Court, Maidstone, was a good 2nd. The best twelve trusses of any yellow *Rose*, were superb *Marchal Nil*, from Mr. Robins; Mr. Geo. Mount, Ross Nursery, Canterbury, was 2nd, with *Marie van Houthe*. Mr. G. Prince, nurseryman, Oxford, had the best twelve trusses of any one variety, having glorious trusses of *Princess of Wales*, Mr. Mount being 2nd, with fine examples of *The Bride*. Mr. Mount was the only exhibitor of six centred *Roses*, three blooms of each.

Mr. James had the best twenty-four trusses of stove and greenhouse flowers, *Orchids* being a leading feature; and Mr. Douglas had the only twelve trusses of *Orchids*, both lots being shown in ordinary flower-pots with Fern, which is a method scarcely worthy of the traditions of the Regent's Park.

Messrs. Barr & Son had the best collection of *Iris*, staging a considerable number; and Messrs. Paul & Son were 2nd.

Show *Pelargoniums* were a good feature, Mr. C. Turner being placed 1st with twenty-four superb trusses; and Mr. D. Phillips was a good 2nd. Mr. Phillips was 1st with a similar number of trusses of zonal *Pelargoniums*; and Mr. Howard, 2nd.

Some very good fruit was staged. The best collection came from Mr. Edmonds, gr. to His Grace the Duke of St. Albans, Bestwood Lodge, Notts, who had very fine *Madresfield* Court, *Black Hamburg*, and *Backland Sweetwater Grapes*; *Hales' Early Peach*, *Lord Napier Nectarine*, *Washington Blum*, *Queen Pine*, *Black Circassian Cherries*, *Rib J. Paxton Strawberry*, *Melons*, &c.; 2nd, Mr. Robins, Hartwell House, with *Backland Sweetwater*, *Foster's Seedling*, and *Black Hamburg Grapes*, four dishes of *Peaches*, &c.

Some good *Pine-apples* were shown by Mr. T. Coomber, gr. to J. A. Rolfs, Esq., Hendre, and Mr. H. Morris, gr. to A. P. Vivian, Esq., Glen Afon, Tarbock. *Melons*, in pairs, were well represented.

The best 12 lb. of *Black Grapes*, any variety, were superb *Black Hamburg*, from Mr. T. Osman, gr. to L. J. Baker, Ottersham Park, Chertsey; Mr. G. Clinging, gr. to W. Greenwell, Esq., Caterham, was 2nd, with capital fruits of the same variety.

The best 12 lb. of any white variety, came from Mr. R. Feist, gr. to R. J. Ashton, Esq., Staines, who had *Muscad of Alexandria*, very good; Mr. A. Smith, gr. to G. Sewell, Esq., Loughton, being 2nd, with *Foster's Seedling*.

Mr. Osman was 1st with three bunches of finely finished *Black Hamburg Grapes*; and Mr. Edmonds was a good 2nd.

Mr. G. Thomas, gr. to W. E. Wells, Esq., Halton-harst, Hounslow, was 1st with three bunches of any other *Black Grapes*, staging very fine *Madresfield* Court; Mr. G. Clinging was 2nd, with the same.

Mr. Feist was the only exhibitor of three bunches of *Muscad of Alexandria*—remarkably good.

Three bunches of any other white were represented by good *Foster's Seedling*, from Mr. Clinging, and from Mr. G. Astlett, gr. to C. Butler, Esq., Hatfield.

Mr. Douglas had the best two dishes of *Peaches*, unnamed; Mr. T. Hare, Welzinger Gardens, Grant-ham, was 2nd, with good fruit of Dr. Hogg and Early Louise.

Mr. Douglas also had the best two dishes of *Nec-*

tarines, unnamed; Mr. J. Nash, gr. to D. Fuller, Streatham, was 2nd.

Mr. W. H. Divers, Ketton Hall Gardens, Stamford, had the best two dishes of *Strawberries*, staging *Laxton's Noble* and *Auguste Nicaise*; Mr. G. Thomson was 2nd with *Sir C. Napier* and *President*.

The best two dishes of *Cherries* were *Black Circassian* and *Elton*, from Mr. T. Hare.

In the class for miscellaneous fruit, Mr. J. Hudson, the gardener, Gannersbury House, Acton, was awarded a 1st prize for a tray of fine fruit of *Lord Napier Nectarine*.

Botanical Certificates were awarded to *Xerophyllum asphodeloides*, two plants, of which from the open border, each bearing three spikes of bloom, from Mr. Howes, gr. to Lord Walsingham, Merton Hall, Norfolk; to *Azides Sanderiana*, *Epidendrum Raddii*, *Cypripedium Volonteanum*, *Oncidium Koraimensis*, and *O. crispum* *Rothschildianum*, *Batemannae Wallisii*; *Cattleya Mossie*, *Measresseanum*, *Odontoglossum Bleui splendens*, *Phaius Humblotii* and *P. Humblotii* alba, *Phenix Rebolentii*, and *Cattleya Brymeriana*, from Mr. F. Sander, St. Albans; to *Cattleya Mossie decora*, *Bertolonia Souvenir de Gand*, and *Arisea filiformis*, from Mr. B. S. Williams, Victoria Nurseries, Holloway; to *Odontoglossum Galeottianum*, from J. Slatter, Esq., Whitefield, Manchester; to *Cypripedium Aylingii*, from Mr. E. Ayling, gr. to J. Hollington, Esq., Forty Hill, Enfield; to *Saxifraga McNabiana*, from Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, S.E.; to *Cattleya Mendelii* *Hack-bogossie* and C. *Mendelii* Alfred Smea, from A. H. Smea, Esq., Wallington, Surrey; to *Cattleya Mossie Reineckiana pallida*, from Messrs. H. Low & Co., Upper Clapton; and to *Cypripedium californicum*, a small-flowered species, nearly or quite hardy.

Floral Certificates were awarded to the following varieties of *Papaver*:—*Oriental*, *Royal Scarlet*, *Prince of Orange*, and *Brilliant*, from Mr. T. S. Ware; to *Begonia Davisii* variegata, from Mr. R. B. Davis, nurseryman, Yeovil; to *Canna Madame Crozy*, from Messrs. Paul & Son, Old Nurseries, Cheshunt; to *Begonias*, *Marchioness of Headfort*, *Miss French*, *Viscount Wolsey*, and *Sunset*, from Messrs. J. Laing & Sons; to *Iris aphylla*, *Bridesmaid*, *I. variegata*, *Darius*, and *Campanula pridesifolia* alba *grandiflora*, from Messrs. Barr & Son, King Street, Covent Garden; and to *Paeonies* Stanley, *Emily Kelway*, and *Duchess of Fife*, single; and *Duke of Clarence*, *Sainfoin*, *Princess May*, and *Duchess of Teck*, double; and to *Delphiniums* *Alfred Kelway*, *Evelyn Kelway*, and *Horace Kelway*, from Messrs. Kelway & Son, nurserymen, Langport.

The following awards were made to miscellaneous exhibits, these forming some of the most striking and effective features in the Exhibition:—*Silver-gilt Medal*, to Messrs. F. Sander and B. S. Williams, for remarkably new and valuable collections of *Orchids*; the *Small Silver-gilt Medal*, to Messrs. J. Laing & Sons, for a very fine group of plants, *Orchids* and *Begonias* being prominent; to Messrs. Kelway & Sons, for a wonderful collection of cut blooms of *Paeonies*, *Pyrethrums*, *Delphiniums*, *Iris*, &c.; and to Messrs. W. Paul & Son, Waltham Cross, for a collection of *Roses*, &c.; the *Large Silver Medal* to Messrs. H. Low & Co., for a collection of *Orchids*; and to Messrs. Thomas Rivers & Son, Sawbridgworth, for a collection of fruit trees; the *Small Silver Medal*, to Mr. G. T. White, Winchmore, for a group of *Orchids*; and to Messrs. H. Cannell & Co., for a collection of *Begonias*. The *Large Bronze Medal* to Messrs. Barr & Son, for a collection of cut blooms of hardy flowers; to Mr. T. S. Ware, for the same; and to Messrs. W. Cutbush & Son, nurserymen, Hightgate, for a collection of *Ivies*. The *Bronze Medal* to Mr. J. F. Mould, for a collection of *Erics*; and to Mr. G. Prince, for cut *Roses*.

A basket of fine, dark, *Tree Carnations* came from Mr. T. Pike, Park Road, Acton, bearing the name of *Uriah Pike*; and cut blooms of his two new decorative *Pelargoniums*, *Princess Beatrice* and *Prince Henry*, from Mr. F. Perkin, Regent Street, Leamington.

READING HORTICULTURAL.

JUNE 4.—A very bright summer show, held as usual in the Abbey ruins on the above date, was completely marred by a steady fall of rain during the afternoon. In this respect, the Society is very unfortunate, and when a wet day occurs, a certain financial loss results.

Stove and Greenhouse Plants.—The handsome prizes offered for twelve specimens in flower, brought

three collections, and Mr. Finch, gr. to J. Marriott, Esq., Coventry, coming in with fresh, well-grown, and well-flowered specimens, was able to beat Mr. J. Cypher, of Cheltenham. Mr. Finch's leading plants consisted of a fine piece of Cattleya gigas, Clerodendron Balfourianum, Dipladenia Regina, Erica affinis, E. ventricosa minor, Ixora Fraseri, and the fine Azalea indica Model. Mr. Cypher had good plants of Erica vitricosa minor alba, E. tricolor Wilsoni, Darwinia fuchsoides, D. tulipifera, &c. Mr. Mould, nurseryman, Pewsey, took the 1st prize with six plants, having medium sized, even specimens in good condition.

In the class for four plants, Mr. Baskett, gr. to W. J. Palmer, Esq., Reading, was 1st; and Mr. Woolford, gr. to A. Palmer, Esq., 2nd. The best specimen plant was a finely-grown and bloomed example of Clerodendron Balfourianum, from Mr. Baskett; Mr. Willis, gr. to H. J. Simmonds, Esq., Reading, was 2nd, with the same, also a very fine plant.

Ericas.—In the class for six, Mr. Mould was 1st; and Mr. Cypher 2nd. Mr. Mould had good examples of E. Cavendishiana, E. ventricosa, E. depressa, and E. Fairriana. Mr. Cypher's best plants were E. affinis, E. Lindleyana, and E. tricolor Wilsoni.

Orchids.—These plants form more and more a feature at the Reading show each year. The best three were Mr. Cypher's, and consisted of fine examples of Cymbidium Lowianum, Cattleya Mendeli, and Cypripedium barbatum; 2nd, Mr. Baskett, with a fine piece of Oncidium sphaaculatum majus, Dendrobium thysiorum, and Cypripedium barbatum.

Some good specimens came also from Mr. Finch and Mr. Lawrence, gr. to Mrs. Owen Knox, Caversham. The best specimen Orchid was a very fine piece of Vanda teres, from Mr. H. J. Simmonds; Mr. Lawrence coming 2nd, with a good example of Sobralia macrantha.

Groups of Plants were much inferior to those of preceding years. In the class for a large group, Mr. Woolford was 1st, with the only one that could lay claim to tasteful arrangement; Mr. House, gr. to J. Taylor, Esq., Reading, was 2nd. In the case of the smaller group, Mr. Frost, gr. to W. Palmer, Esq., Reading, was 1st, and Mr. Sumner, gr. to J. W. Hounslow, Esq., Reading, 2nd.

Polyanthuses.—The 1st prize for nine show varieties was awarded to Mr. Ashby, gr. to W. Fanning, Esq., Whitechurch—a good lot of well-grown and flowered plants. In the class for four specimens, Mr. Baskett was 1st, and Mr. Woolford 2nd.

Calceolarius and Gloxinias were finely shown, and made charming patches of colour. Some of the best Gloxinias grown for exhibition are found at the Reading Shows. Mr. Baskett had the best six plants, large, finely-grown, and of splendid quality; Mr. Lockie, gr. to the Hon. G. Fitzgerald, Oakley Court, Windsor, was 2nd. Mr. Dockerill, gr. to G. W. Palmer, Esq., Reading, had the best six Calceolarias, admirably grown and bloomed, and of rare quality; Mr. Baskett being 2nd, with plants only just inferior to those.

Roses in pots were shown in groups of six and four, and were very creditable. Mr. Dockerill was 1st with the former, and Mr. Lockie with the smaller number.

Foliage Plants were well shown. Mr. Finch had the best six, Kentias being his leading feature; Mr. James, nurseryman, Norwood, was 2nd. Mr. Dockerill had the best six stove and greenhouse Ferns. In the class for four specimens, Mr. Baskett was 1st.

Some very good Palms were shown in threes. Mr. Finch was 1st, with good specimens of Kentia Forsteriana and Coccos Weddelliana; Mr. J. James was 2nd, having a fine Raphis, but two others out of condition.

Collections of fifteen exotic Ferns and Mosses, of six Lycopods, and also plants for table decoration, were good features.

Cut Flowers.—These were represented by Roses, an admirable twelve being shown by Mr. Turton, gr. to J. Hargreaves, Esq., Maiden Erlegh, Reading. Mr. Dockerill was 2nd. Show and fancy Pansies were fairly well shown. Mr. Finch had the best twelve bunches of stove and greenhouse flowers; and Mr. Castle, gr. to Mrs. Le Malet, Twyford, the best twelve bunches of hardy flowers. Buttonholes were also well shown, and some excellent vases of garden and wild flowers.

Fruit.—Some very good fruit was shown. Mr. Ashby had the best two bunches of Black Hamburgh Grapes; and two excellent bunches were also shown by Mr. Turton, who was placed 2nd. Mr. Turton had the best two bunches of white Grapes in

Foster's Seedling. Strawberries were represented by a very fine dish of James Veitch; and another of Sir J. Paxton. Peaches by excellent Gross Mignonne, from Mr. Robins, Hartwell House, Aylesbury.

Vegetables were a good feature. Excellent round and kidney Potatoes, Lettuces, Asparagus, Rhubarb, Cucumbers, and Mushrooms, being staged.

Messrs. Sutton & Sons Special Prizes.—These were for six Begonias, Mr. Lockie being 1st with some admirably-grown and bloomed plants; and Mr. Goodman, gr. to C. Hammersley, Esq., Bourne End, 2nd; also for six Calceolarias, some excellent specimens being staged by Messrs. Dockerill and Lockie, who were 1st and 2nd; also for six Gloxinias, some superb plants were staged by Mr. Baskett and Mr. Balchin, gr. to B. Simonds, Esq., Reading.

Messrs. Carter & Co., High Holborn, offered special prizes for their Model Cucumber, Mr. Lockie staging some fruit that was perfect in every respect; and Mr. Goodman was 2nd, with some that were scarcely inferior. Mr. Dockerill had the best fruit of Blenheim Orange Melon.

Among exhibits not for competition was a length of tables filled by Mr. G. Phippen, Oxford Road Nursery, who had plants, cut flowers, and floral decorations in great variety; Mr. Lees, gr. to Mrs. Marsland, the Wilderness, had Rhododendrons; and Mr. Churchman, Wokingham, a number of Melons.

COLONIAL NOTES.

BRITISH GUIANA.

PRIMITIVE games form the subject of a very interesting essay by Mr. Everard Im Thurn, who, as magistrate, has resided for many years among the Redskins, and who has on various occasions contributed remarkable photographs to our columns. In the present paper he describes various games and ceremonies in which the natives indulge, and which are remarkable for the imitation they offer of the habits of various wild animals, as well as for the Spartan endurance of pain which some of them entail. Tototalism does not seem to be a native virtue. Some of the natives feed almost entirely on the Ita Palm, *Manritia flexuosa*, utilising for this purpose the pith and the pulp of the fruit, while the fermented juice of the plant supplies them with drink.

STRAITS SETTLEMENTS.

The annual report by Mr. Ridley, the Director of the Botanic Garden and Forest Department, shows that the necessity of planting for timber on a large scale is being felt. The increased cost of smaller timber for poles, posts, &c., is already influencing the cost of cultivation of Gambier and Pepper. Of firewood the Mangrove swamps furnish a sufficient supply. The difficulty in cultivating Orchids arises from the permanent dampness of the climate, which prevents the plants from enjoying a season of rest, and develops a tendency to produce leaves and buds rather than flowers.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending June 7, is furnished from the Meteorological Office:—

"The weather has been generally changeable and unsettled, with somewhat frequent rain over all the more western and northern parts of the kingdom, while overcast skies and rain alternating with brief intervals of sunshine, have prevailed in the south-eastern districts.

"The temperature has not differed materially from the mean; in 'Scotland, E.' and 'England, N.E.' an excess of 1° or 2° is shown, while in most other districts there has been a similarly small deficit. During the early morning of the 1st the minima were very low for the time of year; at Cirencester the sheltered thermometer fell to 30°, and at Llandoverly to 31°, while in most other localities (except on the coast), readings between 33° and 37° were recorded. The highest of the maxima were recorded

on rather irregular dates, and, varied from 72° in 'England, E.' and 'Ireland, S.' to 65° in the 'Channel Islands'; 64° in 'Scotland, W.' and 62° in 'Scotland, N.'

"The rainfall has been more than the mean in Ireland, Scotland, and the 'Channel Islands,' and just equal to it in 'England, S.' and 'England, N.W.,' in all the other English districts it has been less than the normal amount.

"Bright sunshine has been less prevalent (except in the 'Channel Islands') than for some weeks past. The percentage of the possible amount has varied from 19 to 33 in Scotland, from 22 to 21 in Ireland, and from 25 to 29 over England; in the 'Channel Islands' the percentage was 42."

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the direction, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.		
	ACCUMULATED.					In.	No. of Rainy Days since Jan. 1, 1890.	Total fall since Jan. 1, 1890.	Percentage of possible Duration for the week.	Percentage of possible Duration since Jan. 1, 1890.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing S.C. Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

VARIORUM.

AN IMMENSE NURSERY.—Thomas Meehan, one of our most active and intelligent representatives in Common Council, has been, and continues, a man of success in whatever his varied resources are applied to. He wields a prolific pen, is fluent and pleasing of speech, and whether he skims from the surface of social and political affairs, or dives into the depths of scientific research, he is always interesting and instructive. It is the combination of rare qualities, no mere accident, which has made our townsman to follow safely in every one of his undertakings, and at the same time a safe man to follow. The practical and visible evidence of his enterprise is probably more familiar to many in what are known throughout the country as Meehan's Nurseries. Originally the nurseries were located on Main Street, and extended through to Chew Street, occupying the long strip of ground since divided by Meehan Avenue. Later the large business was removed to the present situation on Chew Street, back of Church, and now the nurseries extend from Chew Street to Stenton Avenue (the old township line), a depth of nearly three-quarters of a mile, and in one of the most attractive portions of northern Philadelphia. That these are the largest nurseries within the limits of the city is certain, if not the largest in the country. But apart from the remarkable success

thus achieved, the nurseries have opened a field of employment for a large number of persons—a living for many families, in fact—and in this we are sure the Messrs. Mehan & Son find not the least of their gratification. Success seems to have been perched on their banner from the start, and if that part of the city is not very soon hemmed in by brick and stone walls, it is hard to say where another decade will find the nurseries spreading to Germantown (Guidr, Philadelphia, U.S.A.)

Obituary.

JOHN RAWLINGS.—We regret to announce the death, on the 4th inst., at the age of thirty-five years, of Mr. John Rawlings, of the firm of Rawlings Brothers, Old Church, Romford, an eminent Dahlia grower. In the year 1888 a great flood occurred at Romford, and Mr. John Rawlings, who had serious work to do in consequence, obtained a severe wetting, which brought on pleurisy, that has now terminated fatally.

He was the elder of the two brothers trading as Messrs. Rawlings Bros., florists, of Romford, and the third son of Mr. George Rawlings, of Bethnal Green, for many years a well-known raiser and exhibitor of Dahlias. In 1879 Mr. George Rawlings retired, and the business passed into the hands of his second and third sons—John, the deceased, and Arthur. The brothers have been very successful in raising some very fine Dahlias, and the first batch sent out in 1879 comprised Mr. George Harris, Shirley Hibberd, Mrs. N. Halls (fancy), Frank Rawlings, and William Rawlings, followed by J. T. West, Mrs. Douglas, Mrs. Glascock, Mrs. George Rawlings, Mrs. John Walker, Queen of the Belgians, R. T. Rawlings, J. J. Saltmarsh, Frank Pearce (fancy), and others. These are all fine varieties, and find a place among the best exhibition Dahlias of the day. R. D.

MARKETS.

COVENT GARDEN, June 12.

BUSINESS is now very good, and all classes of goods are easily cleared after alteration in prices. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots such as Arabis Sieboldi, Azalea, Aspidistra, Begonias, Calceolaria, Cyrena, Daphne terminalis, Erica Cavendishii, Euonymus, Ficus elastica, etc., with their respective prices.

OUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various out flowers such as Abutilons, Azzleaz, Bourdians, Callistochyris, Carnations, Cornflower, Gardenias, Iris, Heliotropes, Lilac, Maiden Hair Fern, Marguerites, Mimogonette, Myosotis, Narcissus, etc., with their respective prices.

ORCHID-BLOOM in variety.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits such as Apples, Grapes, Lemons, Melons, Peaches, Pine-apples, Strawberries, etc., with their respective prices.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing various vegetables such as Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Leeks, Lettuce, Mushrooms, Mustard and Cress, Onions, Parsley, Rhubarb, Sea-kale, Shallots, Spinach, Sprue, Brussels Sprouts, Tomatoes, Turnips, etc., with their respective prices.

POTATOS.—Since our last report, prices generally have had a serious collapse, the most rapid of Foreign arrivals were nearly unsellable. Jerseys and Cornish, 7s. to 8s.; Maltes, 5s. to 7s.; Lisbons, 3s. to 3s. 6d. East-Kents commenced low, at 14s. per cwt. Stock of old Potatos very low, prices for which have seen no change. J. B. Thomas.

SEEDS.

LONDON: June 11.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market thinly attended, and without any feature either of interest or importance. Clover seeds generally are just now quite neglected. The Board of Trade returns estimate the Clover and Grass seed imports into the United Kingdom as 7554 cwt., value £14,337, for May, 1890; whereas for May, 1889, there were only 2331 cwt., value £652. Mustard steady. Rape seed easier. Fine Blue Peas scarce and firm. Bird seed unchanged.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, during the week ending June 7:—Wheat, 32s. 10d.; Barley, 20s. 1d.; Oats, 19s. 8d. For the corresponding period last year:—Wheat, 28s. 9d.; Barley, 20s. 9d.; Oats, 18s. 11d.

FRUIT AND VEGETABLES.

SPIALFIELDS: June 11.—Plentiful supplies of green vegetables, new and old Potatos; demand good. Scarce supply of fruit; demand for same brisk. Prices as under: Foreign Tomatoes, 2s. to 3s. per box; Gooseberries, 4s. 6d. to 5s. per half-sieve; Rhubarb, 1s. 6d. to 2s. 9d. per dozen bundles; Asparagus, 1s. to 1s. 9d. per bundle of 100 heads; Sea-kale, 1s. to 1s. 6d. per punnet; Cabbages, 2s. to 3s. 6d. per tally; Radishes, 2s. to 4s. 6d. do.; Cauliflowers, 2s. to 3s. per dozen; Spinach, 3d. to 6d. per bushel; Greens, 1s. to 1s. 6d. per dozen bunches; Carrots, 1s. 6d. to 2s. 9d. do.; spring Onions, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. 6d. to 2s. do.; Mint, 1s. 6d. to 2s. per dozen bundles; Beetroot, 6d. to 8d. per dozen; Hoseradish, 1s. 1d. to 1s. 4d. per bundle; Egyptian Onions, 6s. to 6s. 6d. per cwt.; Endive, 1s. to 1s. 6d. per dozen; Cos Lettuce, 6d. to 1s. 6d. per score; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets.

STRAFORD: June 10.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. 6d. to 4s. per tally; Greens, 1s. 6d. to 2s. per dozen bunches; Carrots (household), 50s. to 60s. per ton; Mangels, 12s. to 18s. per ton; Onions, Egyptian, 6s. 6d. to 8s. per cwt.; Apples, Australian, 10s. to 16s. per case; Watercress, 6d. to 7d. per dozen bunches; Lettuce, 1s. 3d. to 1s. 6d. per score; Mint, 2s. 6d. to 3s. per dozen bunches; new Carrots, 2s. to 6s. do.; Onions, 2s. 6d. to 3s. do.; Cucumbers, 2s. to 5s. per dozen; Gooseberries, 5s. to 5s. 6d. per half-sieve; Cherries, 4s. to 6s. per box; Tomatoes, 3s. 6d. to 4s. do.; Peas (green), 5s. to 6s. per bushel; Asparagus, 1s. 6d. to 1s. 9d. per bundle.

POTATOS.

BOROUGH AND SPIALFIELDS: June 10.—Old: Regents, Scotch, 35s. to 45s.; Magnums, blackland, 35s. to 40s.; Lincolns, 45s. to 50s.; York, 65s. to 75s.; Kent and Essex, 50s. to 55s.; Scotch, 70s. to 110s.; Imperators, 40s. to 70s.; New: Malta and Canary Islands, 47 to 49; Jersey; 47 to 49; Lisbons, 45 per ton.

SPIALFIELDS: June 11.—Quotations:—New Jersey...

Jersey rounds, 6s. 6d. to 6s. 9d.; do. kidneys, 7s. 3d. to 8s.; do. flukes, 8s. to 8s. 6d.; Cherbourg rounds, 5s. 6d. to 6s.; do. kidneys, 6s. 9d. to 7s. 6d.; do. flukes, 7s. 6d. to 8s.; St. Malo rounds, 5s. 9d. to 6s.; do. kidneys, 6s. 6d. to 7s.; Lisbon rounds, 4s. to 4s. 6d. per cwt. Old: Magnums, 35s. to 70s.; Champions, 38s. to 55s.; Hebrons, 30s. to 40s. per ton.

STRAFORD: June 10.—Quotations: English light Magnuma, 50s. to 65s.; dark, do., 40s. to 50s.; Scotch, do., 65s. to 85s.; New Jersey flukes, 8s. to 9s. per case; kidneys, 7s. 6d. to 8s. 6d. do.; Curbons rounds, 3s. 9d. to 4s. 6d. do.; Cherbourg rounds, 5s. to 5s. 6d. do.; do. flukes, 8s. to 8s. 6d. do.; St. Malo, 5s. to 5s. 6d. do.; kidneys, 6s. 6d. to 7s. 6d. per score.

NOTICES TO CORRESPONDENTS.

BROCCOLI: Methven & Sons. A Broccoli of excellent shape; white, well protected, very robust, and of good flavour when cooked. It would probably prove to be a late or midseason variety in the South, and would fill up the gap sometimes felt between Broccoli and Cauliflowers.

CYTISUS SCOPARIUS ANDREANUS: J. S. This is merely a variety of the Spanish Broom, with brown and yellow flowers, and in all other particulars identical with the type.

FUNGI: Foestry. Fungi sent for naming must be perfect. Yours have imperfect stems; one is stemless. The spongy fungus found on the ground is Boletus granulatus; the smaller example, from the tree, is Polyporus adustus; the larger one from the tree, Agaricus adustus, with its gluten washed off or dried up. W. G. S.

GRAPES: J. R. Badly fertilised flowers, and the Vines are growing with too much grossness to be very fruitful; the wood, nevertheless, is getting well ripened. You must artificially impregnate the bunches another season.

NAMES OF PLANTS: J. Nelson. Clematis lanuginosa; Anthericum liliatum.—J. H. Austria Briar, copper-coloured variety.—E. L. 1, Jasminum revolutum; 2, Hemerocallis flava.—S. S. Cinnam Mooreanum.—W. F. & S. Dendrobium moschatum, but abnormal, two flowers being joined.—C. E. F. Stachys betonica var.—G. C. W. Serapias pseudo-cordigera.—J. T. S. Asteriscus maritimus.—G. B. Muscari comosum monostrosum.—Hambly, Cichorium Intybus (Chicory).

PANSIES: J. C. & Co. Pretty for beds and pots, if it be fixed in character.

PINE SHOOTS BORED BY BEETLE: A. C. Hyllurgus piniperda. Fir thinnings and branches afford hiding and breeding places for the beetles, and should be cleared off and burned. In the case of small trees, the infested shoots should also be cut off and burned. Standing trees much affected should be felled. All Pine trees felled should be barked, and the bark taken away, as it is decayed bark that is their favourite breeding place.

SHANKING IN GRAPES: J. H. S. It is not known with certainty what it is that causes shanking in Grapes. But we do know that, in cold, heavy, close soil, especially when the border is deep, and the roots penetrate low down, or when it has been made with much manure, or too heavily mulched in summer, shutting out air and heat from the soil, the Grapes shank.

VINES: J. Street. The leaves and wood stem show great vigour, and the shanking you complain of may be due to errors in ventilation; but, as you do not send berries, we do not know if it be true shanking.

WATER IN GARDEN TANK: E. C. Neither the staleness of the water, or the Oak leaves laying at the bottom of the tank, cause the rustiness of the leaves or the falling of the flower-buds. The cause of these maladies may be traced to errors in ventilation, or to the use of too strong manures, artificial or other. You do not say if it be well-water or rain-water.

WHOLE OIL SOAP: A. C. Any horticultural sundries-man would supply you with it.

COMMUNICATIONS RECEIVED.—G. J. Shaw (shortly),—J. Street.—E. N. J. L. (next week),—J. H. Storey.—H. W. W.—Dr. Dilling.—E. C.—J. F. W.—Southampton (send better specimens).—G. A.—B. T.—W. F. T.—W. Calverley.—G. P.—W. T. H.—M.—C. G.—E. R.—J. B.—W. A. F.

SOLD by SEEDSMEN and FLORISTS.

BENTLEY'S WEED DESTROYER.

Mr. W. BOULDEN, *Marston Gardens, writes*—
"I have used your Weed Destroyer for several
seasons. It is doubtful if anything more effective
will ever be concocted."

Mr. E. MOLANEX, *Swinburne Park Gardens,
writes*—"I am much pleased with the Weed Killer.
In addition to killing the Weed effectually, the gravel
on our paths is rendered particularly bright by its use."

Sluggicide (Registered), 1s. 6d. per box.—The SLUGGICIDE CO.,
6, Maryleport Street, Bristol. Agents wanted.

GREAT REDUCTION IN PRICE OF STANDEN'S MANURE

Established Nearly 30 Years.

The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices:— 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS:

CORRY, SOPER, FOWLER & CO. (LIMITED), LONDON.

Sold by All Nurserymen, Seedsmen, and Florists.

SLUGS.—Save your Garden Produce by using "Leous," 5s. per gallon, Diffuser included.

LIQUID MANURE ESSENCE. Inodoruous, for Greenhouse and Garden, 5s. per gallon—will make from 50 to 100 gallons.

ARTIFICIAL MANURE, without Smell, will produce grand blossoms, unsurpassed for Fruit and Vegetables, 112 lb., 20s.; 56 lb., 11s.; 28 lb., 6s.

ANTI-MILDEW, 10s. per gallon.

PLANT FUMIGATOR, combining Meat or Fish Smoker, Disinfecter, or Domestic Safe, 4 feet 6 in. high, 27s. 6d.; 6 feet, 35s.

G. C. BROOKES & CO.,

72, LEADEN HALL STREET, E.C.

GARDEN REQUISITES.

COCOA-NUT FIBRE REFUSE,

4d. per bushel; 100 for 2s.; truck (loose, about 2 tons), 40s.; 4 bushel bags, 4d. each.

YELLOW FIBROUS LOAM, PEAT-MOULD, and LEAF-MOULD, 1s. per bushel.

SPIRÆNUM MOSS, 8s. 6d. per sack.

MANURES, GARDEN STICKS, VIRGIN CORK, TOBACCO CUP, RUSSELL MANURE, and for Price List—

H. G. SMYTH, F.R.H.S., 21, Goldsmith's Street, Drury Lane (clately called 17A, Coal Yard), W.C.

Three Valuable Friends.

CLIBRAN'S SHADING acts as a beautiful shade during sunny weather, but becomes almost transparent during rain—reappearing again as the glass dries. Unlike other preparations, it shades only at the particular time wanted. Practiced growers are noting this. Non-poisonous. 1s., 1s. 6d., and 2s. 6d. per packet, post free.

LEMON-OIL is fast superseding all other insecticides, being cheaper, far more certain, and can be safely used by any amateur. If you want beautiful foliage and healthy plants, try this. Post-free, pint, 1s. 10d.; quart, 3s. 6d.; half-gal, 5s. 6d.

EUCHARIS MITE-KILLER.—This valuable compound enables everyone to grow and flower Eucharis Eucharis Friend, splendidly, and has saved thousands of plants, which otherwise would have been destroyed. See Testimonials. Post-free: ½ pints, 1/4; pints, 2/9; quarts, 4/3; ½ gal., 8/-

Obtain your Seedsmen, CLIBRAN'S, OLDHAM NURSERY, ALTRINCHAM; Also 10 and 12, Market Street, Manchester.

GENUINE GARDEN REQUISITES,

Extracts from *Thirtieth Annual Collection of Reports*—**NATIVE GUANO FOR POTATOS, VEGETABLES, FRUIT, &c.**—C. FIDLER, Reading, used it for Potatos, and says:—"I found your Manure gave very satisfactory results."

C. J. WATTE, Gr. to Col. the Hon. W. P. Talbot, says:—"I can strongly recommend your Native Guano as a first rate Manure for any fruit or kitchen garden crops, also grass. In the 5 years during which I have freely used it, I have gained over 500 prizes."

NATIVE GUANO FOR ROSES, TOMATOS, &c.—W. G. BAILEY, Nurseries, Bexley, used it for Roses, Tomatos, and Cucumbers, and says:—"I find it a good and cheap article."

A. F. BARROW, Royal Horticultural Society, says:—"Without doubt a very valuable Manure, and easy of application."

Orders to the **NATIVE GUANO CO., Limited,** 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

Testimonials.

"Sir,—As you are, I am, a great admirer of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly, signed, MARY SHELLEY."

"Horley Castle, Lancaster, February, 1890."

"Major FOSTER has much pleasure in stating that the frames and glazing houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardeners."

"1st to 5th, Ripley, Yorkshire, January 23, 1891."

"Sir HIRSH DORRIS has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 6 years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

HELLIWELL, 9, Victoria Street, Westminster.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, **DURRY LANE, to W. RICHARDSON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.**

N.B.—The best and safest means of Remitting is by POST OFFICE MONEY ORDER.

To Noblemen and Gentlemen requiring Land Agents, STEWARD, BALIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 227 and 233, High Holborn, W.C.

Gardeners, Foresters, Land Stewards.

R. B. LAIRD and SONS can recommend with every confidence Scotchmen thoroughly qualified as **GARDENERS, FORESTERS, or LAND STEWARDS,** either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—**JOHN DOWNIE, Seedman, 141, Finsbury Street, Edinburgh.**

THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, Liverpool, are in a position to recommend a first rate man as HEAD GARDENER, or GARDENER and BALIFF, & also a thoroughly competent man as HEAD GARDENER, who has a good knowledge of Orchids; unexceptional references in each case.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply a Lady or Gentleman with particulars, &c.—**St. John's Nursery, Worcester.**

 versant with above. First-class testimonials, including
 London House, seeks re-engagement, either at home or abroad.
 Would travel. Moderate salary.—SEEDS, Gardener's Chronicle
 Office, 41, Wellington Street, Strand, W. C.

TO FLORISTS.—Wanted, by experienced
 hand, situation in Florist's Business, for summer months,
 at the seaside.—L. FINCH, 189, Soho Road, Huddersford,
 Huddersford.

HOLLOWAY'S OINTMENT and PILLS.
 A frequent cause of gout and rheumatism is the inflamma-
 tory state of the blood, attended with bad digestion and
 general debility. A few doses of the Pills taken in time are
 an effective preventive against gout and rheumatism. Anyone who
 has an attack of either should use Holloway's Ointment, also
 the powerful action of which, combined with the operation of
 the Pills, must infallibly effect a cure. These Pills act directly
 on the blood, which they purify and improve. Having once
 subdued the severity of these diseases, perseverance with the
 ointment, after fomenting the affected points with warm brine,
 will speedily relax all stiffness and prevent any permanent
 contraction.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
 HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,
 THE KING OF THE BELGIANS,
 THE LATE EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
 And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. "The Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 155,000 of these Machines have been sold since they were first introduced in the year 1836, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have been pronounced the most successful. 1st. They are worked with much greater ease than any other. 2nd. They are the least liable to get out of order. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long grass, wet or dry.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

ROYAL GARDENS, WINDSOR, January 28, 1890.
 To Messrs. GREEN & SON, Limited.
 Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1836; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself. As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them—they are unequalled. During the season I have them daily in use in the Royal Gardens here, and never have the slightest trouble with them. Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace, the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Aidershot. I shall feel a great pleasure in recommending them to all my friends.
 I remain, dear sir, yours very truly,
 THOMAS JONES.

Wellingtonborough, February 4, 1890.
 To Messrs. Green & Son, Leeds.
 Gentlemen—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for 25 years, and I find them more durable and do their work better than any other machines I have seen.
 I am, gentlemen, yours truly,
 DAVID FERIVAL,
 (Gardener to W. Blott, Esq.)
 Cottingham, Hull, February 13, 1890.
 To Messrs. Green & Son, Limited, Leeds.
 I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 36-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it for repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose Price List.
 I am, gentlemen, yours truly,
 JOHN BAYNTON,
 Ivy Back, Broadway, Worcester, April 13, 1884.

1st Mr. J. R. STIRLING, of the ROYAL GARDENS, BUCKINGHAM PALACE, writing under date Feb. 24, 1890, says—
 "As regards the work your 12 inch Horse Machine does (which two years ago took the place of the one you supplied in '60), I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your "Hand Silens Messors" also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers."
 Kithbury, Hungerford, April 20, 1883.
 Sirs,—I shall be glad of a list of your Lawn Mowing Machines priced. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Mo day was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is surprising to think of the work it has done, and how well.
 Yours faithfully,
 Messrs. Green, Leeds.
 ALFRED T. BAZETT.

Some fifteen or sixteen years ago, I had from you one of your 12 inch Lawn Mowers which, I may say, has from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever since.
 I am, yours faithfully,
 Messrs. Green & Son, Leeds.
 C. FRENCH HARTLEY.

Bathesda, Ashford, Kent, June 11, 1878.
 Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work with so little power. You may refer anyone to me, and I will then show them the S. M. at my yard, and I shall show it to all I can.
 I am, yours truly,
 Messrs. Green & Son,
 W. H. MOLD.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.
 PRICES, With Grassbar.

Brunswick Nursery, Tottenham.

Expiration of Lease. First Portion.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. John Moller to SELL by AUCTION, on the Premises, The Brunswick Nursery, Tottenham, N. close to the White Hart Lane Station, G. E. R., on THURSDAY NEXT, June 26, at 12 o'clock, the erection of ten GREENHOUSES, with a new water Pipe, Boilers, and Brickwork; 120 movable Lights; also a large quantity of Stove and Greenhouse Plants, Ferns, Chrysanthemums, Ampelopsis Vetchii, &c. May be viewed one week prior to the Sale. Catalogues had in the above valuable plant in their SALE, on WEDNESDAY NEXT, June 25.

Friday Next.

IMPORTANT SALE, by order of Mr. F. Sander.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 25, at half past 12 o'clock precisely, a very fine assortment of imported fine ORCHIDS, including EPIDENDRUM VITELLINUM MAJUS, large importation, in fine order.

- CATLEYA CITRINA, very fine, lumps.
- ONCHIDIUM CRISpum GRANDELORUM, a good lot.
- VANDA BOLDENI, a splendid lot.
- ODONTOGLOSSUM LUTEUM PURPUREUM HYSTRIN.
- VANDA GERTELE.
- PLEURON BILLS.
- ODONTOGLOSSUM ORCHORHYNCHUM.
- ONCHIDIUM EMULUM, with splendid buds and buds.
- ODONTOGLOSSUM COLETTIANUM.
- ODONTOGLOSSUM LEHMANNII, a lovely spotted form of O. sp.
- DENDROBIUM DENSI-FLOREM.
- LELIA ANEUBS, a fine importation.
- DENDROBIUM MARMORATUM.
- CYMBIDIUM EUBURMI.
- CYPRIPEDIUM INSIGNE MONTANUM.
- SACCOLABUM BLUMI and AMPULLACEUM.
- VANDA CATHARTIC.
- CYPRIPEDIUM CONCOLOR.

Also a varied COLLECTION of ESTABLISHED ORCHIDS, all in first-rate order, with many showing for flower, including Dendrobium, Odontoglossum, Cattleyas, Calanthes, Lælia, Phalaenopsis, Oncidium, &c.

Also about 2,000 GREEN TREE FROGS.

ANGREUM, NEW SPECIES.

Offered for the first time. A magnificent thing, and one of the finest and most curious of the genus. The plant is of a robust habit with its fleshy leaves resembling those of Vanda Parishii, borne on strong Vandean woody stems, and producing stout arching sprays of large, pure white, fragrant flowers, with tails 8 in. in length. It is totally different to anything in literature, and is only represented in gardens by the small plant in Sir Trevor Lawrence's collection, the sole survivor of the two previous consignments. All the plants are offered, and being strictly cultivated, are safe.

ANSELLIA SPECIES.

A new form of the A. africana section, but producing golden-yellow flowers, spotted with crimson, each 3 inches across, and often sixty or seventy on a spike. The plant is distinct in habit, and produces its noble spikes on growths from 3 to 18 inches in length, avoiding the ungainly growth of typical Ansellia africana. It should be a magnificent show plant. See dried flowers.

Also some HEALTHY plants, on native wood, of the fine and very rare ANGLETHUM BILBOUM, one of the most elegant of the genus, and the very rare Angreum intricatum; the hitherto uncoloured A. armenicum, and a distinct looking new Angreum, with branched spikes of pretty flowers of delightful fragrance and long duration.

Also a few fine masses of two extraordinary CHRISOPE-TALUMS, the whole collected in a hitherto unexplored region, from whence the precarious and costly passage renders it difficult to get plants alive.

On view morning of Sale, and Catalogues had.

Wilmington, near Dartford.

Two miles from Dartford, and 1 1/2 mile from Swanley

Practically without reserve. FREEHOLD MARKET GARDEN GROUNDS. Important to Nurserymen and Market Gardeners. Possession will be given on payment of small deposit, and balance by instalments.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at the Ball Hotel, Dartford, on THURSDAY EVENING, July 3, at 7 o'clock, 115 Plots of FREEHOLD BUILDING LAND, a large HOTEL SITE, two LEASEHOLD HOUSES, and 20 ACRES of FREEHOLD LAND, suitable for a large Fruit and Flower Nursery, Fruit Growers, &c. Plans and Particulars of J. MERRICK HEAD, Esq., Solicitor, Regate; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Cut Flowers, Plants, and Bulbs.

We hold Sales, several each week. Reference to senders of 5 years standing. Particulars on application. MESSRS. PROTHEROE and MORRIS, Sale Rooms, 6, Phillip Street, adjoining Market Hall, Birmingham.

To Florists, Nurserymen, Landscape and Market Gardeners.

Nicotine Soap.

AN Unrivalled INSECTICIDE for the use of Plant Cultivators, being an effectual ERADICATOR of SCALE, THRIPS, GREEN FLY, MEALY BUG, and ALL PARASITES affecting PLANTS, WITHOUT INJURY TO FOLIAGE. It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved, beyond all doubt, that no Insecticide will bear comparison with it for its deadly effect on Insects, combined with perfect safety to the Plants themselves.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 1s. 6d. and 3s.; in Tins, 15s. 6d.; and in Drums, 28 lb., 25s.; 56 lb., 50s.; 112 lb., 95s.

L'HORTICULTURE INTERNATIONALE (Linden), Brussels, Belgium.

NEW ORCHID, ANNOUNCED FOR THE FIRST TIME, CATTLEYA WAROCQUEANA (LINDEN).

See R. A. ROLFE'S description in Gardeners' Chronicle, June 14, page 285.

The discoverer of this Cattleya, M. BUNGEROTH, of Cateau-la-Pommeroye, one of the collectors of the Company, writes about this grand introduction:—

"This is the most beautiful Cattleya. Never during my travels in Columbia or Venezuela have I seen Cattleya Mendocino, Trianae, or Mossie, to be compared with it. The flowers are of enormous size and exquisitely rich colour. I have seen a number plants in bloom; one seemed still more beautiful than others. I am assured that there are also some pure white forms among them. This species is very free flowering, bearing from five to six flowers on a scape."

The plants arrived in Europe on April 18 last, in splendid condition, with healthy dormant eyes, and well leaved. On arrival, several plants were found in bud; on the opening of the flowers, they fully verified the statement above.

This Cattleya is of very robust habit, with large thick leathery leaves. In culture this species seems especially easy; since their arrival, the plants have without special care or treatment produced an abundance of roots.

We recommend Orchid lovers the acquisition of this grand Cattleya; the plants offered are all unopened. We are certain that some magnificent varieties will turn up among them.

We have spent a large sum of money in the researches of this magnificent Cattleya, and offer the same at the lowest possible terms.

We offer good semi-established plants in excellent condition, rooting freely, at the following low terms, cash:—

Table listing prices for various Cattleya plants, including 'One good plant', 'Three good plants', 'Twelve good plants', etc.

Carriage Free to any part of the United Kingdom.

LOVELY CLIMBERS FOR GREENHOUSES.

Every Amateur should possess one at least of the following list:—

- Passiflora. A beautiful Passion-flower, lovely violet maroon, blue, and purple. A gem for any fond of Passion flowers. 1s. 6d. & 2s. 6d. each.
Passiflora. A novel and distinct variety, colour purple, white, blue, and violet, with a colour of exquisite fragrance—a plant performing a whole house. 3s. 6d. each.
Climbing. A climbing variety of the popular Niphetos Rose. Flowers white, delicately scented. Very free bloomer and rapid grower (shoots have run 20 feet in one season). 2s. 6d. each.
Clematis. An old yet beautiful climber, flowers pure white and most beautiful. Blooms with uncommon freedom. 1/6, 2/6, and 3/6 each.

LOVELY STOVE CLIMBERS.

- Allamanda. This Allamanda well deserves its name, flowers about 5 inches diameter, clear yellow with conspicuous deep orange eye low throat. 1st season one large plant had 32 blooms on one stem—the blooms being produced in succession from June to September. 3s. 6d., 5s. 6d., and 7s. 6d. each.
Clerodendron macrostemon. Pure white flowers, with slender stalks about 4 1/2 inches long, stems and styles reddish-purple, distinct and beautiful. 2s. 6d. and 3s. 6d. each.

- Stephanotis floribunda. We believe the variety we have of this lovely climber is the finest in existence—blooms at every point on comparatively young plants. 1s. 6d., 2s. 6d., 3s. 6d., and 5s. each.

CLIBRAN'S, Oldfield Nurseries, Aitricham.

PLANTS in Pots, that can be planted all through the summer.

CLEMATIS, all hardy, in great variety.

ROSES, Tea-scented, &c.

CREEPERS for Walls. N.B.—By planting snugly object may easily be made beautiful. LISTS and advice free.

THE Gardeners' Chronicle.

SATURDAY, JUNE 21, 1890.

MEREWORTH CASTLE.

THE railway station nearest to Mereworth Castle is Wateringbury, two miles distant; but four miles' walk in the garden of England seemed to me more desirable than two, so I alighted at Malling—which, by the way, you should pronounce with the a broad, as in maul, and make a good mouthful of the first syllable, the same as when you open your mouth to receive a Tiptree Strawberry. For a country village, Malling looks so prosperous and substantial that you might be sure the land was good thereabouts, and that some special employment, such as fruit growing or Hop culture, afforded ample employment for the people. It was a shrewd remark of William Cobbett's, in riding up the valley of the Medway, that the numerous villages and large churches bespeak fertility, wealth, and population. The land is far beyond the average in fertility, and a small slice of it sufficed in old times, and still suffices, to support a larger village population and fill a bigger church than common. The picturesque remains of Malling Abbey show that the medieval church had an extensive establishment here. Some of the ancient buildings still remain, and one portion of them has assumed the form of a substantial modern residence, with a great orchard adjoining partly enclosed by old stone walls.

Leaving the street of Malling behind, and its several handsome houses in the suburbs, and retracing the name of village, for it is, in fact, a small country town, you overtake several orchards, and then, within two miles, reach a lodge and iron gate, which form the entrance to a carriage-drive, leading through the woods to Mereworth Castle. This new road to his dwelling was completed by the late Lord Falmouth seven years ago; and, as his widow, the Dowager Viscountess of Falmouth, was not at home when I rang the lodge bell, I thought, perhaps, even a

CHEAP OFFER OF ORNAMENTAL TREES and SHRUBS.

EXPIRATION OF LEASE.—A Large Quantity of ORNAMENTAL TREES and SHRUBS to be SOLD CHEAP, owing to the above cause.

Full particulars on application to The Liverpool Horticultural Co. (John Cowan), Ltd., The Vineyard and Nurseries, Garston, near Liverpool.

The Best Present for a Gardener. VINES and VINE CULTURE. The most complete and extensive Treatise on Grapes and their Culture ever published. New Edition. Price 6s., post-free 5s. 6d. A. F. BARRON, Royal Horticultural Society, Chiswick.

stranger on foot, and unintroduced, might be permitted to follow his nose the nearest way to the Castle, but the worthy old lady at the lodge seemed afraid to unlock on account of her orders, and as I did not care to climb over the gate, I made my way to the little village, and so to the very singular-looking residence called the Castle. I lost nothing by the slight detour, for it must be admitted that the new road is painfully straight. The late Lord Falmouth was eminently a person of practical mind. All the world knows how straight he went through his life, and how straight he made his jockeys go. It is quite in keeping with his character that the road to his front door should have been driven as straight as the flight of an arrow. No doubt time is saved by this arrangement, and any man running a race for his dinner would wish the event to be settled on a road as direct as the carriage-drive of Mereworth Castle; but from a landscape gardener's point of view, roads of this sort are, in plain English, extremely ugly, especially when unrelieved by timber on the margins, as great part of this "new cut" is. On either hand are long lines of vegetables, of all kinds, but separated from the road by a broad margin of turf and a flower border, gay at the present time with clumps of the herbaceous Peony, in much variety of colour; and as symmetry ruled supreme at one time at Mereworth, the colours of any pair on opposite sides of the road must match. It is a rare and curious sight, these two parallel lines of huge Peonies, stretching to a distance of 210 yards, soon to be carpeted underneath with dwarf Nasturtium and other bedding plants.

The person who named the house a castle must have had in mind some castle in the air rather than a terrestrial building, since no part of it presents the slightest resemblance to a castellated residence. It is a fanciful-looking dwelling, situated in full view of the high road, at a how's shot distance. The house is a replica of a residence which the builder, one of the great house of De Spenser, had seen in Italy, and dates from the year 1750. The site was much improved by the late Lord Falmouth, and if the house itself is odd-looking, the garden around is admirable. It always seems to me that when a very pleasing park surrounds a dwelling, and envelops it with green delicious turf, that such a site may be spoiled by pushing the park to a distance, and interposing numberless beds of flowers that blaze for a few months only in the summer. That mistake has not been committed here. The flower-beds are not extensive, and they are not entirely evanescent, since they are pleasantly edged with permanent Box. The wide lawns of green grass, with the park beyond, form a truly English and appropriate ornament. I had reached this point in my walk with Mr. Markham, the well-known head-gardener here, when a steady downpour of rain set in, and our visit to the extensive roseroy and to other ornate enclosures near the house, surrounded with handsome clipped Yew hedges, had to be cut short. [The roseroy consists of a square enclosure of about half an acre, surrounded on one side by a tall half hedge of Yew, and on three sides by grand old shrubs, some evergreen, some flowering, which are all that remain of a once thickly-planted shrubbery. The shrubs suffered by contact with their neighbours, as they always do, but the fittest survived, if a little damaged in the contest. The Rose beds are long parallel-logs, stretching almost from side to side of the garden, and are planted with dwarfs and very tall standards, 6 to 7 feet. The display is a good one, doubtless, as the plants mostly show great vigour, and would be a better one if rich mulchings might be afforded them. What is not Rose bed is the nicest of turf. En.] We took refuge in the kitchen garden and its houses, where fruit and vegetable culture are admirably carried out by Mr.

Markham, who is evidently a master of this branch of gardening.

In outdoor fruit growing, soil is even more important than climate, and we are here in a district where the soil is pre-eminently suited to the production of every kind of fruit, from Cob Nuts to Peaches. At the other end of the hasty, the home-road, near the old woman's locked gates, it seemed to me that the soil was poor. A fruit farmer, I fell in with, said it would grow good fruit when broken up, and so said Mr. Markham. I cannot therefore doubt it; but the vegetation and the native timber are stunted compared with that near Malling, and I presume that the best timber grows here as elsewhere, on the best land! The stony subsoil of the Mereworth woods is, however, often covered, Mr. Markham says, with an unctuous and rich marl, in which every kind of fruit tree flourishes, and which needs very little manure till the trees come into bearing. The production of heavy crops alters the case, because the export of soil constituents then need proportionate imports to support the drain. It is astonishing how entirely many farmers have ignored the simplest principles of science in the mismanagement of their orchards, which they leave unmanured for generations, and still wonder at the starved produce. Some years since I visited Wateringbury, one of the most productive parishes which the famous Medway flows through. My object was to inspect the shorthorn herd of world-wide fame belonging to the late Mr. Loney. The broad backed beauties of that famous breeder were grazing in a Cherry orchard, and Mr. Loney told me that the trees—large as forest timber—had been formerly starved, till their poor small fruit became unfit for the London market. But he had fed his big pets so freely with oilcake on the pastures, that the trees were again producing large Cherries of the best quality.

Peaches revel in the soil of Mereworth, and the walls are well planted with them. The trees are mostly dwarfs, fan-trained, and consist of the best, earliest, mid-season, and late varieties, American and French. We noticed Noblesse, Alexandra Noblesse, Belle Beauce, Hale's Early, a splendid variety, indoors or out; Téton de Venus, Grosse Mignonne, and Early York—delicious, if smallish.

All the best varieties of Nectarines grow with equal goodness and freeness, and the fruit comes of a very high colour, and it may be noted as a remarkable fact, that the Stanwick variety does not crack in the Mereworth soil. The Peach and Nectarine trees suffered a good deal this season from blister and aphid, but are now clean, and not much the worse for the attack. The remedies employed were soft soap, and Quassia chips boiled in water, the trees being syringed with the mixture twice, or at the most thrice. As we all know, these enemies are not the only ones, for red spider will soon put in an appearance on Peach foliage in dry weather, but repeated syringing with clear or soapy water will clear out these insects.

There are 8 acres of kitchen garden situated near the end of the straight road I have mentioned, and my attention was at once taken with the splendid vigour and perfectly healthy look of the cordons of Apples running round the margins of the walls. They consist of a collection of large and showy varieties, whose names perhaps Mr. Markham will give in some of his contributions to the *Gardener's Chronicle*, for the number seemed so great that time did not allow me to place them on my notes. The examples of espalier-trained Pears were as remarkable for clear stems, healthy foliage, and desirable robustness as the Apples, and some varieties which had escaped injury by frost were bearing good crops. Pear trees on walls were mostly of greater age than the espalier, and good bearing seemed the rule with them. For want of protection, the Fig trees on some walls had had their shoots cut back 6 or more inches. It was an experiment, but the lesson it taught has been duly learnt. The garden affords a capital soil and site for the Mulberry, which ripens its fruit well here on a platform of turf. Many kinds

of vegetables had yielded their produce at an early season. Cabbages had been cut three weeks at the time of my visit, May 9, and as Mr. Markham is known to excel in vegetables and fruit, out-doors and in, I may mention for the information of those who desire such guidance that the sorts are Melin's, Early Danfield Market, Early Evesham, Veitch's Early, and Ellam's Early, the last-named being the earliest on the ground and liable to a certain drawback—it must be cut as soon as it is ready, or it will split. Lettuces had been in use a fortnight, and Potatoes were 18 inches high. Ne Plus Ultra French Beans were well out of the ground, under the shelter of a hothouse, where London, and Walcheren, and Veitch's Pearl Cauliflower, also found shelter and warmth. Myatt's Ashleaf is the only Potato grown here, and its excellent quality may be partly due to the soil, for it is indisputed that the flavour of vegetables is much affected by the soil. Asparagus had been cut freely since April 25. Monstreux de Viroflay Spinach had been cut all through the winter, but it has been found to bolt before Veitch's Improved. Both have much more vigour than older varieties. The early Peas in this model garden were 24 inches high, and the earliest of all—Veitch's Extra Early—was in full blossom [and is now being gathered; the gardener has great faith in Champion of England Pea. Ed.] A curiosity among the early vegetables was Veitch's Extra Early Milan Turnip, with strap-shaped leaves. By the middle of May the Turnips would certainly be 3 inches in diameter. The Windsor and Mazagan Broad Beans were a foot in height. Strawberries were in full blossom out-doors, and were fruiting so successfully within that they require special notice. There are two Strawberry-houses, each containing 500 plants. Sir C. Napier was in blossom in one case, and ripe in another, a lot of earlier-fruited plants having been removed. The crop then ripe, and ripening, presented a beautiful sight, the fruit being remarkably large and firm, and of a good bright colour. Probably the capital colouring may be partly due to Mr. Markham's plan of separating the fruit from the leaves, and exposing it by a simple arrangement of upright twigs and slight cross-sticks, over which the fruit-stalks are laid, so as to lift them well up, while the leaves are kept from shading the Strawberries by pegging them back out of the way. The crop already cleared consisted of Viscountess; many of the fruits weighed 1 oz. each. Noble is a woolly Strawberry picked with Sir C. Napier. French Beans had been picked some weeks in this well managed but not extravagant establishment. Melons are usually early—the second week in May. The late lord was not an advocate of numerous sorts of any fruit. His idea was to find out the best sort, and then stick to it ever afterwards, and grow no other. Green Gem was always the favourite sort here. But some persons may prefer netted Melons, and for the sake of variety, Sutton's Triumph and a few others have now been admitted.

The true Green Gem Melon is, as its name implies, a green-fleshed variety with a dark green skin, which so remains when the fruit is ripe. It is thick-fleshed, thin-skinned, very rich and juicy, and of great specific gravity, with no great number of seeds. A good fruit would weigh 2 lb. to 3 lb. Triumph is a handsome netted fruit, of very fine flavour when true, and the house in which it is grown is well ventilated, and no attempt is made, by giving the plants copious waterings, manual or otherwise, to increase it beyond its normal size. Flavour in some kinds of fruit is a fixed quantity, and if this be distributed through fruits of great size, it becomes largely diluted and not very perceptible. Golden Gem Melon, a medium-sized oval fruit, of good eating quality, and Bleuheim Orange Melon, are grown in a house with the others.

Cucumbers in the adjacent house were exceedingly fruitful. The first are generally cut on Good Friday. Lockie's Perfection is esteemed here for its excellent quality and colour. The Cucumbers are grown in good loam of the country, manured with

wood-ashes in preference to dung, so as to avoid an over-growth habit. Melons are grown in the heavier soil, which abounds here, and feels "greasy" in the hand. Strawberries in pots are planted in similar soil, well rammed. The old red Tomato, although other varieties are grown, is considered the most prolific for early indoor fruiting, and it will ripen well out-of-doors when others fail to set their blooms. When the soil becomes exhausted somewhat, guano-water is afforded it once or twice a week.

The Grapes in one of the houses were bearing a crop on stout rods, 14 feet long, reaching to the ridge. They had done their work very rapidly, having been propagated from eyes in February last year, and planted in the following June, in succession to some old Vines of Hamburg which ripens in May. Alternate rods of the young Vines were left for bearing, and allowed to run the full length, 14 feet as just stated. These will be removed. The permanent Vines were stopped at 4 feet. There are five vineries, and in one of these we found a full crop of fine bunches of Muscats without a shanked or a seedless berry; in another, Hamburgs, two years old in July, and ripening and colouring well. The Vines are all as healthy as possible, with a vigorous appearance and leathery foliage. The other kinds of Grapes grown are Madresfield Court, Lady Downes, and Gros Colmar.

In the two Peach houses, Peaches have been grown weighing $\frac{1}{2}$ lb. The sort, Waterloo, which was started this year, February 1, and will be ripe June 1, before Stirling Castle, Grosse Mignon, or Bellegarde. [We saw fruit of Hale's Early picked on June 14, which on being weighed by Mr. Markham turned the scale at 9 oz. Eo.] The rain continued to fall pretty freely as I quitted the grounds, and took the road to Waterbury Station for Maidstone. But a warm rain does not deter the birds from singing, and they piped away pleasantly in the hedges, the nightingale among them. In fact, the *prima donna* of the feathered race was singing loudly by the roadside before Mr. Markham's door, and we paused in the dripping shower to listen to her. H. E.

NEW OR NOTEWORTHY PLANTS.

CATLEYA \times INTRICATA, *Robb. f.* VAR. MACULATA, *n. var.*

CATLEYA intricata is evidently a natural hybrid between C. intermedia and one of the rather numerous forms of C. guttata, as pointed out by me at p. 70 of the last volume (July 20, 1889). A few days ago Mr. Malcolm Cook, of Kingston Hill, Surrey, brought to Kew a fine plant which is evidently derived from the same parentage, though somewhat different in colour. The sepals and petals are of a delicate rosy blush, with many rosy-purple spots, in this respect recalling the variety Prinzii. The side-lobes of the lip are of a uniform delicate blush, and the front lobe deep amethyst purple. It is a very charming thing. It was collected on the mainland of Santa Catharina, Brazil. R. A. Rolfe.

THE LILY DISEASE.

In the winter of 1888, through the kindness of General Russell Hastings, of Hamilton, Bermuda, I had the opportunity of investigating a disease, epidemic in the Lily fields there from March to July. Diseased specimens had previously been shown to several naturalists who had visited Bermuda, and a few of the same had been sent to the United States for examination. None of those who saw these specimens were able, upon a merely cursory examination, to identify the disease; so that the subject still remained open for investigation.

Towards the end of February I sailed for Bermuda, in order to observe personally the phenomena attendant upon the first stages of the disease, which

usually begins early in March. A few words on the cultivation of the Lily in Bermuda, and upon the history of the disease, may not be out of place.

The industry is a comparatively new but prosperous one, being only a few years old. The Lily cultivated is the so-called *Lilium Harrisii*, a dwarf variety of *Lilium longiflorum*. This variety has been propagated from year to year by bulb-scales, and by a few plants raised yearly from seed. The latter are always more vigorous than those raised from bulb scales; they tend, however, to return to the original longiflorum type. The bulbs, planted in the early autumn, grow throughout the winter months, and flower in the spring. They are taken up again early in the summer, and shipped to the United States, where a good market is also found for the flowers in the spring months. The Lilies are planted in rows, in small fields; these fields are surrounded by high Oleander hedges, which serve to protect the plants from the wind.

So far as I know, the Lily disease was first noticed about 1885, since which time it has yearly become more serious, until at present it threatens to do serious damage to the Lily crop. It makes its appearance in the spring, when the days begin to grow warm. This marked difference in the temperature between day and night results in a heavy fall of dew, so that even after the sun is high in the heavens large dew drops may be found upon the Lily leaves. A little cold weather, or a few warm, dry days free from dew, will check the activity of the disease; while a warm, damp day will cause it to spread with great rapidity. The disease first appears as a minute orange-coloured spot upon a leaf or flower, usually on the upper side of the leaf. The spot gradually increases in size, and finally spreads throughout the whole leaf. In this way whole plants may be killed, and only the stalks left standing.

Shortly before visiting Bermuda for the second time, my attention was again directed to the fungus as a cause of the disease by the appearance of Professor Marshall Ward's description of a similar disease caused by a fungus growing upon the *Lilium candidum* in England. Upon my arrival in Bermuda, in February, 1889, I renewed my efforts at inoculation with bacteria, but in every case without success.

The fungus appeared to me to be identical with the Botrytis recently described by Prof. Marshall Ward* as growing upon the *Lilium candidum* in England, and from a specimen sent to him Prof. Ward has identified it as the same. So far as I know, the *Lilium candidum* is exempt from the disease in Bermuda, but this species is only occasionally grown there, and then with only a few together. Under similar circumstances the longiflorum also is generally exempt, the plants in the fields alone suffering. The true longiflorum is not considered to be as susceptible to the disease as the *Harrisii*.

The principal conclusions arrived at in this paper are the following:—

1. A disease, hitherto unexplained, and threatening to become a serious epidemic in the Lily fields of Bermuda, has been assigned to a definite cause.
2. There is no evidence that the blight is due to the stings of insects.
3. There is no evidence that the disease is caused by bacteria.
4. There is strong evidence that the disease is caused by a fungus, growing upon and within the leaves or flowers.
5. The fungus which causes the Bermuda Lily disease is identical with the Botrytis recently described as the cause of a similar disease in England.

In making the investigation just described, it was hoped not only to discover the cause of the disease, but also to suggest remedial measures. In this connection I may remark that the fungus itself seems

to be delicate, so that its growth might probably be checked by almost any of the poisons used in the treatment of plant diseases, were it not for the difficulty of applying these effectively. Either a powder sprinkled on the leaves, or a liquid sprayed upon them, would here be ineffective, for the moisture would soon remove them, leaving the fungus free to grow. If, however, the fungus were present at the time of the application of the remedy, that part of it growing outside of the leaf might be killed, although that would not prevent the mycelium within the leaf from continuing to grow.

I have, however, observed that plants growing under the shelter of the Oleander hedges are remarkably exempt from the disease. This I attributed at first to the drippings from the leaves, which I thought might partake of the acrid character of the sap of the Oleander. I am inclined to believe, however, that it is rather because the Lilies under the hedges are remarkably free from moisture. In fact, the overhanging hedge collects most of the dew, so that the dew drops do not readily gather upon the leaves of the Lily plants, and thus, perhaps, no opportunity is given for the growth of the fungus.

It might, therefore, be found feasible to grow, in alternate rows with the Lilies, some other crop, which, being higher, and having more spreading foliage, should keep off the dew. A row of stakes with branches wattled among them might serve the same purpose, and check the virulence, even if it did not entirely prevent the recurrence of the disease. *Alexander Livingston Kean.*

THE BOTANICAL GARDENS, OLD TRAFFORD, MANCHESTER.

DURING Whitsun week, though the weather was dry and a low temperature at night, with cold winds by day, these gardens were yet delightful, for the full flush of their early growth was upon them; and a vigorous leafage was accompanied by free heads of bloom. One cannot help wondering that tree and shrub do so well here, within three miles of the centre of the city, and the atmosphere at all times grimy and thick. Laburnums, Chestnut, Lilac, Thorns in variety, Pyrus, Rhododendrons, pontic Azaleas, and the Guelders Rose, enrich the gardens; one cannot fail to notice how admirably the grounds are kept, and not merely for show days, for Fellows attend daily. Entertainments of various kinds are held.

I asked Mr. Paul, the capable foreman of the gardens, what was done with the exhibition-house and annex when the plants making up the Whitsun show were removed? A few of the spacious bays in the latter are filled with hardy Rhododendrons in fine bloom, and in the remainder are placed *Lilium*, *Nicotiana affinis*, *Azalea amœna*, *Chrysanthemum Precocté*, and other early varieties. On every hand the visitor sees something that is being brought on to furnish commanding groups in the exhibition-house.

One plant which Mr. Findlay grows in large numbers, and finds most valuable for summer and autumn decoration, is *Francon appendiculata*. It has very large specimens of this plant in pots, that throw up many spikes of bloom. They come into flower about the middle of June, and last for a long time. The plants are raised from cuttings taken in September, and grown on generously, and while blooming they are liberally stimulated with manure-water.

In the house everything was in the best order. The fernery is a great source of attraction to visitors at all times. In the show-house there were some beautiful specimens of *Schizanthus retusus* and *pinnatus*, which is always such a prime feature at Whitsuntide. The plants are grown from seed sown in September, and grown on, and about the first week in February five plants of one variety are put into a 10-inch pot. The plants are quite small when put into the flowering pots, but they afterwards grow fast

* "A Lily Disease," by R. Marshall Ward, M.A., F.R.S., *F.L.S. Annals of Botany*, vol. ii., No. 7, November, 1888.

and fine pyramids of flowers are obtained. The plants remain in bloom for a considerable period.

In one of the houses for exotics a specimen of *Clerodendron Balfourianum* is planted out, which at Whitsuntide was in full bloom, and, indeed, had "heaped up its flowers in happy plenteousness." Mr. Paul had loosened the shoots from the roof of the house, and allowed them to hang down, and one was enabled to realise how well it had blossomed. For five months of the year no water is given, but when it starts to grow it is watered freely.

Bedding-out was proceeding apace. Mr. Findlay largely used *Polyanthuses* for spring display, and their vigorous growth was astonishing; but they had to make room for the summer plants. The leading plants employed are:—Dwarf *Tropeolum* The Queen, *Centaurea rugosina*; dwarf growing *Pelargoniums*, of all types; *Iresine*, *Phlox Drummondii*, *Stocks*, *Asters*, a dwarf white *Antirrhinum*, called *Worsley White*, which is raised from cuttings; *Pentstemons*, and especially a fine dark variety named *Horace Vernet*; *Delphiniums*, *Lilium aratum*, *L. speciosum*, *Pyrethrum aureum selaginoides*, *Antennaria tomentosa*, *Pansies*, and *Violas*; a very fine and effective dark blue *Lobelia*, which is raised every year from seed; herbaceous *Phloxes*, &c. By the use of these, a very effective summer display is made. R. D.

[In the current number of *Manchester Faces and Places*, an account is given of these gardens and their management, by Mr. Bruce Findlay, of whom a portrait is given, together with an appreciative notice. Ed.]

THE SINGLE-FLOWERED PEONIES.

THESE showy, hardy border flowers have become very popular during the last few years, and are running the double varieties closely for decorative purposes, although the latter are still highly esteemed. The single forms have a beauty of their own which appeals to most persons, and their shape is certainly symmetrical when compared with the confused petals of the doubles. Some single varieties of *P. albiflora* make excellent plants for large herbaceous borders. The white, delicate pink, and rosy-tinted varieties are also very pleasing, but the purple, purplish-crimson, and those of darker shades, are excellent in effect when planted out; these are independent of the many distinct species now becoming numerous in cultivation. We have in our garden about thirty distinct, single-flowered species, and all of them of the easiest imaginable culture, with the exception of *P. Browni*. This species I have managed to keep alive for some years, but it makes no progress, and has not yet flowered.

An elegant species of small growth is *P. tenuifolia*, with pretty finely divided leaves and crimson blooms. There is also a double variety of *P. tenuifolia*, which is as free in growth as the single form. The height of a plant of *tenuifolia*, when grown in good soil, is about 18 inches. *P. peregrina* and *P. peregrina compacta*, of Levantine origin, are the earliest to flower. The flowers are crimson, and the leaves of large size; the compacta variety grows to a height of 18 inches, but the type is rather taller than that. It is a species found in many old gardens, and was cultivated by Miller, at Chelsea, and by Salisbury, at Brompton.

P. decora has large rose-pink flowers, and a height of 3 feet. We have *P. arietina*, which has rosy-crimson flowers, and its two varieties, *Baxteri*, with crimson-tinted, and *Andersoni*, with rose-coloured flowers. The plants attain a height of 2 feet. *P. arietina* is likewise an old inhabitant of our gardens, the species being figured in the *Botanical Magazine*, from a specimen that flowered in Salisbury's garden in 1807. *P. mollis* is very distinct as a species, and forms a compact plant of 20 inches in height, with broad, downy leaves and rich purplish-rose flowers.

The true *P. officinalis*, a very old garden plant, finds a place in our collection. The flowers, purplish-rose, have pretty crumpled petals; it was a garden

plant so long ago as 1548, and had produced double forms soon after its introduction, a double crimson and double blush white being mentioned by Gerard and Parkinson. The latter writer says the double form produces ripe seeds, which being sown produce both single and double flowered varieties. The variety *P. anemoneflora* is remarkably distinct, the stamens having disappeared are replaced with narrow acuminate twisted petals, the outer petals large, and of a crimson colour beautifully incurved. This variety grows to a height of 2 feet. *P. anomala* is a distinct species, but is probably one of the least beautiful; the flowers are reddish-purple. The plant is said to be of Siberian origin, and yet it is not hardy enough to withstand our winters, owing to their excessive humidity. I do not find that it is here liable to die off in the winter, but then the border in which it grows is well drained.

P. Emodi does remarkably well with us, and is one of the most beautiful of *Peonies*; the plant attains a height of 3 feet, and the lovely white flowers are 6 inches in diameter, with numerous yellow anthers, which set off the flowers to great advantage. The foliage is distinct, and of handsome shape. Dr. Moore, who flowered it at Glasnevin, stated that it was the most distinct of all the herbaceous *Peonies*, and also the most tender; but I cannot say that I have found it to be tender in our garden. Sir Joseph Hooker remarked of it that it is a common plant in the temperate parts of the Himalayas, from Kumaon to Kashmir.

P. Wittmanniana, with creamy-white flowers, is a beautiful species, distinct in foliage, general appearance, and in its flowers. Sir Joseph Hooker says of the plant that there is but little to separate this species from *P. Emodi* and *P. albiflora*. The figure in *Botanical Register* for 1846, t. 9, taken from a plant in the Royal Horticultural Society's Garden at Chiswick, whence it was sent in 1842, has yellow flowers, and Lindley stated that 25 guineas was demanded in those days for a single plant. It is a native of shady spots in forests in Caucasia and Armenia. I may add that in our collection it is perfectly hardy. The true *P. albiflora* has pure white flowers, which are fragrant at eventide, and the plant has more resemblance to *P. Emodi* than to *P. Wittmanniana*. The bright red varieties also go under the name of *P. albiflora*, so that in this case the name is misleading.

The plant grows about 18 inches in height; *P. hybrida* seems to be a cross between *P. tenuifolia* and some other red-flowered species, it having the finely divided foliage of *P. tenuifolia*, but with larger purplish-crimson flowers. *P. Russii* is a handsome plant, 20 inches in height, with well formed purplish-crimson flowers, and conspicuous yellow stamens. The above-named *Peonies* are distinct and handsome garden plants. I am sorry that I can say nothing about *P. Browni*, which is a very rare plant, difficult to grow; it has dark red flowers, and the centre of each petal is almost black. The plant grows 1 foot in height, and the flowers are from 1 to 2 inches in diameter. It is a native of California, and the *American Gardeners' Monthly* says of it:—"Peonia *Browni*, though spreading over a great range of station and climate, is never met with in large numbers; a dozen, perhaps, will be found together, and then you might go for fifty miles, and not find another. That it will do well in any locality is evident from how it grows wild, being found on the hot plains of Los Angeles and San Diego, and also near the limits of perpetual snow on the Sierra Nevada. It shows no preference for wet or dry soil, blooming equally well in both." So much regarding its geographical distribution. The gardener finds it one of the most difficult of hardy plants to manage; but with this exception, single *Peonies* may be said to be of the easiest cultivation; a rich, deep, open soil, and free drainage, they delight in. I trenched the border where our plants grow to a depth of 2 feet, and put in plenty of rich manure. I also for the first year or two placed a mulch of decayed stable-manure in winter around each plant; but this, not being necessary any longer, is omitted.

For the sake of comparison, our plants were planted together, but the effect is better when the plants are set out some good distance apart in a border of miscellaneous herbaceous plants. The plants do not require much attention, remaining for several years in one place without removal.

I find, on referring to my notes, that I have omitted *P. lobata*, a species with lovely carmine-rose flowers, beautifully cupped, and having a height of 2 feet. J. Douglas.

EAST SHEEN LODGE.

CLOSE to the Sheen entrance to Richmond Park, is situate the residence of the Duke of FIFE. The mansion is large, but unpretending architecturally. Large additions are being made to it, however, while in the pleasure grounds great alterations are in progress under the charge of Mr. OSNON. When completed, these will change for the better the present somewhat flat and monotonous surface. Flower-gardening is brilliantly shown on here. At the time of our visit, the beds shown in our illustration were filled with Tulips, beautifully grouped according to their colours, so that graduated harmonies and not violent contrasts prevailed. Houses and pits in the kitchen garden were full of good bedding-out plants, ready to be planted out in due time. The plants, being kept in a growing state all the winter, are good-sized plants by the time they are wanted in June. There are some stately trees scattered about the lawn, among them a fine *Palafoxia*, which flowers every year. Conifers, as a rule, do not thrive, the dry, gravelly soil, perhaps, not being propitious to them. At one end of the terrace is a Japanese summer-house of Bamboo, picked out with buff, the interior a rich deep blue (fig. 128). When provided with curtains, lattice-work, and oriental pottery, this building is both quaint in appearance and comfortable in hot weather.

ROSES.

ROSE PROSPECTS.

I WAS recently through some of the Western Counties—Somerset, Gloucester, Worcester, Hereford, and Shropshire—returning home from Manchester through the Peak District, and I never, I think, was so impressed with the loveliness of our "tight little island" as on that rapid run in the loveliest time of the year, for I think no time is equal to the last week in May and the first week in June; the foliage was in perfection, untouched by sharp frosts, and the varied tints of Ash, Beech, Maple, and other trees, were delightful; while the golden masses of Broom and Gorse, the former the brightest of all our native flowering shrubs, make even railway embankments lovely. Altogether, one could not help feeling what scenes of beauty lie around our doors, while we compass sea and land to see some fresh scenes in which our own land can equal.

But I did not get so absorbed in this as to forget the flower I love so well, and I have been again impressed with the difficulty of giving any decided opinion, owing to the extreme variation in our weather; thus, on Monday, May 19, we had here, in East Kent, a most lovely day, but when I got down to Bath, I found that it had rained continuously from morning until night; and Tuesday, which with us so fine, was, up to a late hour in the afternoon so wet as seriously to damage the attendance at the show on Wednesday, for the ground was so wet that many were afraid to venture out; while I have this morning received from a valued friend in East Anglia a most mournful tale of Rose leaves curled up, green-ly prevalent, and a general gloomy outlook; but, on the whole, I believe that we have not had for many years so bright a prospect. This comes to me from all quarters. We passed through May without those spring frosts which so often prove disastrous to the young shoots, especially those of Teas. In some places rain was

wanted, and which we have now got. Our special culture. Hops, often proves a very good indicator to me of the prospects of our Rose gardens, and although the nights have been cold, their foliage has not turned yellow, and I hear no complaints as yet of vermin on them.

At Bath there is a very keen competition amongst amateurs in pot Roses, and in no place that I know of are they so well done. We know that in the metropolis, growers for sale are the only exhibitors, and those at the great Whitsuntide show at Manchester were not at all equal to those shown at Bath.

Rose; the colour is a deep rosy-yellow, with rose colour at the margin of the petals; it is a good grower and free bloomer. When I saw Mr. Handley's garden, and the number of plants he found it necessary to grow, and the space they took up, I do not wonder that so few amateurs attempt growing Roses in pots.

There are some things which not only the exhibitor but every careful grower will have much on his or her mind just now. His attention will be first of all given to that which destroys so many hopes—

The Maggot.—For the worm in the bud—the beast

and north-easterly winds lately, but as yet I have not seen aphides. Where the collection is small, running the finger and thumb up the shoots will get rid of a good many, the remainder may be syringed off; where a large number is grown, the latter process will be the one adopted, and the various insecticides will supply the material wherewith to effect the destruction; here, too, no mercy must be shown. There is often a difficulty in applying these, and I imagine that the new Stott Distributor is likely to be a valuable help to the garden for this purpose, as also for arresting another plague—

FIG. 126. EAST SHEEN HOUSE, MORTIMAR, THE RESIDENCE OF THE DUKE OF ILLI. (SEE P. 761.)

Especially would I notice those exhibited by the Rev. Edward Handley, which, both for growth and excellence of arrangement, were very noteworthy. There were also some very good cut Roses, and I was glad to see that two, at any rate, of the more recent Tea Roses promise to fulfil the expectations formed of them—Madame Hoste and Ernest Metz, the former a bold yellow flower; but let no one imagine, as I heard a visitor say, that it is to supersede *Maréchal Niel*; it is a different kind of Rose, and not nearly so deep in colour—in fact, reminding one rather of *Cloth of Gold*. Ernest Metz is a very good pink-tinted flesh-coloured Rose. I have in my own garden some very beautiful blooms of *Lady Castlereagh*, which promises to be a most useful

which every Rose grower dreads, and which, protected by the leaves in which it enfolds itself, defies insecticides of whatever kind—there is but one remedy, hand picking. Each tree or plant should be diligently and carefully examined, and no mercy shown to the offender when found, a squeeze between the fingers is the least he can expect for his intrusion, and in no other way can the injured Rosarian treat him.

Aphides.—As yet I have seen none of these on my plants; there is a belief here amongst Hop growers that the easterly winds bring the lice on their plants, and that it is favourable to the increase of all kinds of insect pests. I cannot vouch for this, and indeed doubt it, but we have had a good deal of easterly

Mildew.—As yet I have seen nothing of this in the open ground; there are a few traces of it on some Tea Roses on the wall, showing, I think, that one great cause of it is the alternation of temperature, the wall becomes heated during bright sunshine, and then the thermometer falls to a low point at night, as it has done frequently in May and June, and fungoid growth seems then to take place. Various plans have been proposed for this, but of late years sulphide of potassium has been very largely used, and with good effect; it should be applied with a syringe, in the proportion of one ounce to four gallons of water. There are some places which are especially subject to this pest, and where there is not a free circulation of air, or where the Rose

garden is not shaded by trees, it is sure to appear; but had as it is, it is not nearly so disfiguring to the Rose bushes as—

Orange Fungus.—A pest with which I was plagued some years ago, but which has left me alone for some time. It does not at first show itself on the upper surface of the leaves, but spots of a bright orange on the underneath surface evidence its existence, and this is one reason why it is so pernicious; it is there before you are aware of it, and the matter of syringing is a difficulty, as it must be done so as to reach the under surface. It is very humiliating to see a Rose garden over which you have expended much care, and which has given you quantities of bloom, reduced in a few days to bare poles, for this is its effect—the leaves all fall off; and to some extent this must damage the future health of the plant; but it is remarkable how soon they seem to recover from it. Here, too, I should use sulphide of potassium, and with Stott's "sprayer" the work ought to be effectually done.

I have now written of elements of destruction, but there are one or two other things which ought to be thought of at this season.

Application of Liquid Manure.—This is often put off until it is too late, for it is of very little use if delayed until near the time of blooming; it should be done when the buds are forming; it then imparts vigour to them, and increases both their size and colour. Solution of guano, cow manure and soot, and various other liquids are used. It is well to give them a good soaking twice a week, and if rain follows so much the better. The Rose unhappily is a gross feeder, and will take in almost any amount, but it may be overdone.

Disbudding.—There is nothing which it is more difficult to persuade the ordinary amateur to rigorously carry out. The exhibitor knows better. He knows that if he is to have large blooms, it is useless to leave two or three buds on a shoot. They become small and ill-shaped, and should rather come, they become a soddened mass. It is far better to have one good bloom than three or four indifferent ones. This is also another case in which prompt action is necessary. There are generally found three or more buds at the end of the shoot, and there is no better plan for removing these than that of using a common quill toothpick; but any light instrument will answer the purpose. It is well in handling them to injure the foliage as little as possible, as it is now very tender.

Another word with regard to Rose prospects. There is, I think, every prospect, at present, of an early season. I remember some years ago, when the end of June used to be considered about the height of the Rose season, when the Crystal Palace show was always held on the last Saturday in that month. Are we going back to those times? I imagine that there will be a flutter amongst some committees who have fixed their shows late, but of course the weather of June may alter things very much. But, taking into consideration the well-ripened wood of last year, and the absence of frosts in May, I think we may look forward to what we have certainly not had for some years—a good Rose season. *Wild Rose*. [Publication unavoidably delayed. Ed.]

DISA TRIPETALOIDES.

For the original description of this pretty species by Mr. N. E. Brown, we refer our readers to our issue of March 23, 1889, the material for the same being supplied by Mr. J. O'Brien, Harrow-on-the-Hill, the introducer, and the first to flower the plant. (See fig. 127.) The most noteworthy features of the plant is its freedom of growth, adaptability to different modes of culture, and the extraordinary duration of its flowering. Of the first specimen to flower this year Mr. O'Brien says it was wintered in a cold-house, the small plant, which was in a pan, sending up three flower-spikes, one in advance of the others. The first flowers expanded towards the end of the month of April, the plant being exhibited at the Royal Horticultural Society in the beginning of the following month. Kept in a cold frame, the same spike has lost, at this date (June 14) but two of its flowers; two more are fading; eight are perfect, and seven are in bud; making up, in all, nineteen flowers on one spike. The other two spikes are coming on in different stages, so that the flowering season of this one plant will extend over, at least, a

period of three months. Mr. O'Brien has also plants standing in a cold frame which have been repeatedly frozen hard, and many flower-spikes coming up on these; and at the Royal Gardens, Kew, it has done equally well in a temperate-house.

The flowers are white or blush, spotted with rose; the inside of the hooded upper sepal is very prettily marked with bright rose-coloured dots; and the back of the lower sepal is of rose-colour.

One by one the newly introduced Disas show themselves to be worthy garden plants. *D. racemosa* is handsome and free to grow and flower; and others are to be found, here and there, that are well done. The blue-flowered, grassy-leaved ones, are perhaps the worst-managed at present, due consideration probably not being given to the fact that they are generally speaking heath, and not marsh plants, like the species under notice, and others of the section represented by the beautiful *D. uniflora*, which, under the name *D. grandiflora*, attain to great beauty in many gardens.

PLANT NOTES.

ACHILLEA PTARMICA.

The Milfoils are mostly well known, and the common white Yarrow is a native weed, often too commonly met with in fields and lawns. The pink variety is less frequently met with, and is so showy as to merit a place in any rock garden or border. Among the cultivated kinds there are several of great value, and one of the best of these is *A. ptarmica*, the Sneezewort, which grows about 2 feet high, and produces numerous corymbs of white flowers, which are of great use as cut blooms, lasting a long time when placed in water. The double variety, *A. ptarmica flore-pleno*, is equally, or even more, serviceable in the same way, and both are very hardy, free-growing plants that admit of ready increase—the single from seed, and both by division of the roots. The Caspian Milfoil, *A. eupatorioides*, is well adapted for planting in shrubby borders or semi-wild places, as it is strong in habit and attains a height of 3 feet or thereabouts, and produces large corymbs of bright yellow flowers, making a fine show.

ANCHUSA.

There are few hardy plants that will compare with the Anchusas at this season, the lovely blue of their flowers being quite unrivalled, except perhaps by the Gentians and Lithospermum. The finest is *A. italica*, a vigorous grower, attaining a height of from 3 to 4 feet, and sending out numerous large racemes of bloom. *A. capensis* is another fine species, but which is not so hardy as the foregoing, and should therefore be planted in a sunny and sheltered situation on light soil, where it will grow into an object of great ornament. The British species, *A. sempervirens*, is also very beautiful. It has numerous small blue flowers of a lovely shade, and tall branching stems, and is just the plant to place at the sides of woodland walks, or in the wild garden, and in either situation it is quite at home. At Wolverstone we have it in quantity in our hardy fernery, where it grows very freely, and is always admired. All these Alkanets admit of ready increase either by seed or division. *J. S.*

ORCHID NOTES AND GLEANINGS.

MR. HAYWOOD'S ORCHIDS.

COMPARED with some other collections, it would not be possible to call Mr. Haywood's a large one, but he has a nice manageable number in the highest state of health and cleanliness. In fact, I do not think Orchids could be better grown anywhere than they are at Reigate under Mr. Salter, the gardener's care. Just now there are in flower among others, *Odontoglossum crispum*, which is represented by a large number of plants, the petals of nearly all of which are large

and full, and of most delicate lilac tints. Great care must have been taken to get together such a representative group of the various crispums. There were also some splendid forms of *O. Pescatorei*. Prominent among the Cypripediums were a fine variety of *Bellatulum* and *C. Veitchii* or superbium. Other noticeable Orchids in flower were *Masdevallia Schlimi*, and *Dendrobium Brymerianum* and *Deardi*, the last-mentioned having been in flower for three months. It is a good idea of Mr. Salter's to place *Pitcairnia*s, *Sonerila*s, and other fine-foliaged plants in small pots, so that they keep dwarf among the Orchids, as some offset to the monotonous appearance of the pseudobulbs. The wall of one house is beginning to be covered with sorts of *Pothos*, which will have a very enlivening effect. *C. A. M. Carmichael.*

MR. F. G. TAUTZ'S ORCHIDS.

On Tuesday and Wednesday next (June 24 and 25), Messrs. Protheroe & Morris will sell by auction the first portion of the well known Studley House collection.

SUNNY HILL, LLANDUDNO.

ALL who knew the fine collection of Orchids Joseph Broome, Esq., had at Didsbury, near Manchester, will be prepared to hear that the Orchids at Llandudno are still grand examples of skilful culture, yet, owing to the mildness of the climate at the Welsh Brighton, the outdoor garden of such a practical and enthusiastic horticulturist as Mr. Broome offers as much of interest to the gardener as the indoor plants. All kinds of flowering plants, from herbaceous perennial Ferns, Pelargoniums, and other florists' flowers up to Orchids have found in Mr. Broome a successful grower and exhibitor.

During all these years many a plant has doubtless suggested itself as a likely subject for growing outdoors, in favourable situations, and a glance round the pretty garden by the sea, and sheltered by the rugged hills and rocks at Llandudno, reveal not a few plants usually found in greenhouses doing well in the open air.

Partly covering the steps leading to a garden at a lower level, specimens were observed of the white *Marguerite*, which had been there all the winter, and were 4 feet across, and covered with blooms; grown in this way, *Marguerites* become dwarfed, the height of these plants being only 2 feet. Large tufts were seen of "blue *Marguerite*" (*Agathaea celestis*), a South African plant, sometimes found in the greenhouse, but which could not be stronger or prettier when growing in its native country. Also growing most vigorously, and with an amplitude of foliage not met with in inland gardens, were Japanese Maples, Tree Peonies, and other Chinese and Japanese plants; whilst the presence of clumps of *Cypripedium* spectabile in shady, moist nooks of the rockery which runs round one portion of the garden, of *Aponogeton distachyon* in the water, of *Lagerflora rosea* on a wall, and of rows of *Mignonette* from which flowers have been cut all through the winter, and which are still flowering, spoke of the mildness of the climate.

The ordinary garden flowers come to great perfection at Llandudno; the *Narcissus*, *Polyanthus*, *Auricula*, and *Wallflower* are beautiful in a wonderful degree; some rows—one might almost say some dwarf hedges—of single and double *Wallflowers* were covered with blossoms, and had a very dense growth. Everywhere in this neatly arranged garden, flowers appear; on the rocks, walls, and borders the *Aubrietias*, *Silenes*, *Saxifragas*, *Roses*, *Clematis*, *Doronicums*, &c., are extraordinarily beautiful just now; and the *Coniferae* are in perfect health, with very bright tints of various greens.

THE ORCHIDS.

At the present time the main part of the Orchid display is made up of flowers of *Catleya Mossii*, large specimen plants, some of them with more than a score of blooms on each, their great size and beauty of colour being partly attributable to the goodness of the strain, and partly to their being well managed,

and the favourable climate. It is a certainty that nowhere else have we seen so fine a lot, taken as a whole. Some magnificent flowers had a width of 9 inches across the petals, and 8½ inches when measured diagonally across the sepals. One grand variety is very near to the one exhibited at the Temple Show last year by Mr. Smee, and named C. Mossie Schroederiana. It has a large frilled lip, white in the centre, tinged at the base with primrose-yellow, the usual purple marking on the lip being most absent. Several of the high-coloured varieties are very good, and there is a glow over the crimson on the lips of these, and the C. Mendelii, not usually observable. In the same house were some good plants of Cattleya Lawrenceana, and one of these plants, with fourteen flowers, perhaps is equal to any yet seen. C. Skinneri was in great beauty. Lælia elegans Turneri has made marvellous growths; and the largest and richest crimson coloured of the section—L. e. Broomei—appeared to be as distinct in its growth as in its flowers. Among the Cypripediums, specimens of C. villosum aureum, and C. v. majus were noticed, with from eighteen to twenty-five flowers, and these plants have been in bloom for two months, still being very fresh-looking; C. caudatum, C. Lawrenceanum, C. citiolaris are well-bloomed. With the Cypripedium was a plant of Peristeria elata, with three spikes. In another house was noticed a number of fine Miltonia vexillaria, one of them being furnished with a flower having a fine white lip, and six flower-spikes; fine specimens of Lælia purpurata, Cattleya intermedia, Dendrobium swainsonianum and other Dendrobies, all of which are most vigorous. In the warmer houses were Arifides Houlettianum, a superb variety; A. Fieldingii and A. Lobbi, with several spikes on each; some Vandas, amongst them a finely coloured V. batesi; the showy old Oncidium spheculatum, with many spikes reaching from side to side of the house. Cattleya gigas and C. Dowiana in fine health.

The cool houses were brightened up by coloured Masdevallias being placed among the plants of white Odontoglossums in flower. In the greenhouses, among the usual plants seen in such structures were some specimens of the handsome annual, Schizanthus retusus, which, like the other plants here, speak well of the skill and attention of Mr. A. Cole, Mr. Broome's gardener. They are about 1 foot in height and 3 feet in diameter, and are literally covered with their white lavender or rose-lilac flowers. Mr. Cole kindly imparted his method of growing this good old-fashioned plant. The seeds are sown in the autumn, and when ready, are planted two or three in a pot, kept cool during the winter, and grown on, and repotted as they require it in the early part of the year. The method is simple, and, although useful handling is required, no trouble should be thought too great in order to secure such a fine plant in good condition. The specimens seen would put to shame many an exhibited flowering stove and greenhouse plant. J. O'Brien.

THE ORANGE GROVES OF FLORIDA.

(Continued from p. 707.)

The cost of cultivating and manuring will vary from £10 to £15 per acre, according to the age of the trees. After the fruit is sized, it is wrapped in tissue paper and placed carefully in boxes, which are nailed down, branded, and sent off to the market. Last year's crop was a small one, owing to the exceptionally dry weather in May, causing the fruit to drop off when of small size. I saw only two groves in which the trees bore a good crop, and one of these had never before borne a crop of fruit, and was in a low-lying moist position. The other was General Sanford's grove at Belair. This had the advantage of steam pumps and water pipes all over the grove, so that he was enabled to water the trees during the time the dry weather lasted, employing lawn sprinklers attached to the hydrants for the purpose. The crop was estimated by independent authority to be

10,000 boxes. Most of this was grown on 30 acres of ground, and the whole would be worth 10,000 dols., or about £2080, without any expense being incurred in gathering and marketing. This collection of Orange trees is the finest in Florida. There are also a number of other fruits, and one large plantation of Lemons. The grove was started about twenty years ago, several of the trees coming from Messrs. Rivers' nurseries at Sawbridgeworth, in Hertfordshire. The enthusiastic manager, Mr. Austen, a Scotchman, has been in Florida more than twelve years, and he is able to speak well of the country in regard to its healthiness, &c., and has great belief in the future success of Orange growing if it be done well. A tree of the Grape fruit—a variety of the Shaddock Citrus decumana—in this grove had the heaviest crop I ever saw of any kind of fruit. The tree was about 30 feet high, and 12 feet in diameter of head, and was estimated to have 2 tons of fruit upon it. There is very little demand for this kind of Citrus, it being used only in making *compotes*.

Pines, &c.—Many other kinds of fruits grow well in Florida in certain positions, but for various reasons they cannot be relied upon as staple crops. I saw the finest Pines there I have ever seen, which were much larger than those one usually sees grown in a hothouse at home. These were the property of Mr. Westcott, an enthusiastic amateur, near Orlando. He had specimens of the Smooth Cayenne and Charlotte Rothschild varieties, with ten and twelve rows of large pips, and a conical-fruited variety called "Abakka," which had fifteen rows of pips. These Pines were then (December 7) in the open air, and the fruits were getting ripe. The pips of the fruit swell out to a very large size here under good culture. Mr. Westcott puts a good covering of horse-dung over the roots, some long dry grass on the top of this, supplies the plants with chemical manures abundantly, and waters the plants about twice a week with a hose.

As a rule, Pines are grown in Florida under light airy sheds. These are made by putting strong posts in the ground about 6 feet high, with cross-pieces on the top, and then nailing laths all over the top and sides, about 1½ inches apart; this benefits the plants in two ways, it prevents injury by the sun's rays in hot weather, and serves as a slight protection from frost which occasionally visits Florida; but I regret to hear the above-mentioned plants have been killed since I left, although a shelter had previously been erected over them—others in the neighbourhood have escaped with very little damage.

The Guava grows well, and does not seem to require any manure or attention; in some places seeming to be almost wild. There is very little demand for the fruit, notwithstanding it makes excellent jelly. Bananas grow and fruit well, and look very picturesque when standing near the lakes or on the banks of the small streams. The Mango is occasionally seen, but it is one of the most tender fruits grown there, and has to be matted up in winter. Strawberries pay for growing in suitable positions, but there are not many of these near Winter Park and the surrounding district. It is necessary in such a hot and dry climate to have a certain amount of soil as well as sand to grow them in. This is only found where swamps and similar places have been drained, and even in such positions it was told that irrigation is almost a necessity for them, although, in such places, there may be water within 2 feet of the surface, and doubtless a good deal is supplied from below by capillary attraction. One grower I called on, made 600 dols.—or, say £120—from three-quarters of an acre last season. Firm-fleshed Strawberries are grown, as the fruit must be sent a long distance. The Florida Seedling and Noonan are two varieties very much in favour. They are gathered almost green, as some of them have to be sent to New York, a distance of 1200 miles, and even when allowed to colour they have very little flavour. The season commences in December or January, and lasts until June. The plants do not crop heavily as with us, but they con-

tribute to bear a few fruits all the time. Besides the fruits mentioned above, Le Comte Pears, Grapes (of the Scappernong and White Niagara varieties are grown, and some of the best Muscat Grapes are being tried); Persimmons, Peaches, Malberries, Blackberries, Loquats, Limes, Citrons, Figs, Water Melons, &c., are grown with more or less success; but only in limited quantities.

No corn or grass can be grown here, and vegetables only thrive in favoured spots, near the lakes, &c., where the sand contains more humus, and is really a sandy peat, which does not dry up so quickly. In such-like places vegetables grow well and fast, and arrive at maturity, unless a frost should come, when, of course, they are killed, and a fresh start has to be made. Potatoes planted on December 1 were ready to dig by the middle of January, and Peas sown at Christmas-time were almost ready by the end of February; but every plant must have a lot of manure given it, in order to grow it successfully. When no frost occurs, it would probably be possible to have Peas and new Potatoes all the year through, if they were irrigated.

Some of the gardens are carefully tended, and a very fine effect is possible here, if plenty of water be given the soil. The best garden I saw was at the Seminole Hotel, in Winter Park. This is a very fine building, built all of wood, like most of the houses in Florida, and contains 250 rooms; it is well patronised during the winter months by parties from colder climates.

I noticed particularly some fine plants of *Celosia pyramidalis* in the beds here, which were 3 feet across; some plants, nearly 20 feet high, of *Hibiscus*; a variety with very pretty crimson spikes of flowers; nice beds of *Polargoniums*; *Hibiscus sinensis*; some of the taller plants were carpeted underneath with *Tradescantia zebrina*. *Alternanthera* is used instead of *Box-edges*, and looks very pretty. The grass on the lawn is of one kind only; it makes stems after the style of a minute Bamboo, and is occasionally found growing wild; it is called *Bernuda-grass*, and with plenty of water regularly supplied, it keeps green and fresh during the hot weather. The view from the top of this hotel is very fine, Lakes Maitland, Virginia, and Osceola being all near at hand. A good steamboat is kept on the two latter lakes for visitors, and everything is done by the Winter Park Company to make a visit to Florida agreeable.

The Pine forest in its natural state with the exception of the tracks cut through it, is close at hand; it seems a usual practice to cut down all the Pines, &c., when clearing the land for cultivation, and afterwards to plant lines of trees along each side of the roads near to the towns, as all the land in America is laid out square, and the roads run at right angles, these avenues sometimes run a long distance. A species of evergreen Oak which grows in the forest is generally used for this purpose; young straight trees are selected with stems 2 to 3 inches in diameter, the heads are sawn off, about 10 feet from the ground, and the branches cut off, leaving only a bare pole; these are dug up with very little root attached, and planted where required early in the spring. Sometimes a little fertiliser and some water is afforded the tree for a time; but they soon grow to a good size in spite of this rough treatment, and an avenue of them is a very pretty sight. The wild Orange is sometimes used for the same purpose, but one can hardly see the reason for using it when good Orange trees are just as easily got. This practice of laying all the land out in squares by the State has much to recommend it, as a record of each plot is easily kept, and the transfer of land from one owner to another is a simple affair; but these straight roads and fences will eventually spoil the scenery of the country when all the forest is brought under cultivation.

Among other plants and flowers cultivated in gardens, I noticed a very pretty archway at Winter Park formed of laths, &c., erected over a gateway into a garden, and covered with Orange and white-flowered varieties of *Thunbergia alata*, which looked beautiful in full flower. *Plumbago capensis* and *P. rosea* are often seen doing well. *Poinsettia pl.*

cherrima forms 'very' fine bracts. One splendid plant which I saw was about 15 feet high and 12 feet across, and had a large number of its scarlet flower-heads. *Acalypha marginata* does well in the open; *Tecoma capensis* is very handsome when it receives a little attention. One specimen I noticed tied to stakes about 10 feet high, was covered with its orange-red flowers, and was a very striking object. *Bignonia Cherere* grows at random over roofs of houses and verandahs, &c., and forms one of the finest sights imaginable in the way of a flowering plant. One fine specimen of this plant deserves especial notice. A small arbour had been formed by nailing a few pieces of wood together, enclosing a space about 8 feet square, and 8 feet high; a plant of this species of *Bignonia* had been planted in the centre, and the stem taken straight up; it had afterwards grown all over the sides, covering the whole structure completely, and some of the shoots had run in the sand among the wild grass and bushes near for a distance of 30 feet, and these young shoots were flowering at every joint. The trusses of bright orange-red flowers formed a picture not easily forgotten. Choice kinds of *Coleus* do well; *Vincas rosea* and *alba* make fine plants, and seem to be always in flower; *Gardenias* grow in some places 6 feet high, as healthily as Laurels, but in other places they have a pale, sickly look. Mealy-bug is occasionally seen, but it does not infest *Gardenias* and other things in Florida as it does in our hothouses if neglected. *Oleanders* do well, and make fine plants 20 feet high. The Giant Bamboo is occasionally seen in fine graceful specimens 40 feet high. *Grevillea robusta* is very pretty when 8 to 10 feet high. I saw a few specimens over 50 feet. The Avocado Pear was of the same height, and had grown up from the ground since the frost in January, 1886, when it was killed to the ground.

Yucca aloifolia makes a fine plant, one that I measured was 16 feet high, and the stems 35 inches in circumference. Some of the fan-leaved Palms form splendid plants, but these are really indigenous. Rose bushes flower all the winter sparingly, and they do not, as a rule, form such vigorous bushes as here; but I saw one very fine lot of *Maréchal Niels* in flower on December 23, which were budded close to the ground on a native Rose, and had made shoots nearly 20 feet long. Canker in this plant is unknown in Florida. They give these Roses plenty of water, and mulch the roots with manure, and apply chemical manures besides.

Owing possibly to the quickness of growth, the flowers are not so large or highly coloured as we are accustomed to see. *Agave americana*, and some of the other species, soon flower and make large plants, the warm climate and sand apparently suiting them. I saw one fine plant of *Russelia juncea* flowering well, also the small single Russian Violet was doing well in one instance; various kinds of *Ricinus*, *Cannas*, *Opuntia*, *Abutilons*, *Euphorbias*, &c., are often seen, and there seems no limit to what might be grown with a little attention. *W. H. Divers, Ketton Hall, Stamford.*

(To be continued.)

IRISES.

Nothing else among hardy plants can approach these for beauty and diversity of form, and shaded colours, and a bed or border of mixed sorts in full bloom is a glorious sight at this season. The most chaste and refined are the bulbous kinds known as *Xiphions*, which require a very different treatment to the fibrous-rooted, thick rhizomed, flat, or German Iris, as these latter will succeed almost anywhere in a garden or brook-side [But need drought to ripen. Ed.]; but the *Iris xiphoides* needs a light dry soil and a warm situation. The best place to have them in really good condition, and they are worth any amount of trouble, is a border sheltered by a wall or hedge, and facing south, and if the soil has been properly prepared previous to planting, the plants may safely be left to take care of themselves.

The way to start with them is to dig out the soil,

FIG. 127.—*IRIS XIPHOIDES*. (SEE P. 766.)

or trench it deeply, and mix in with it plenty of sand, leaf-mould, and a little mild rotten manure, and then the plants will increase rapidly and send up a great number of blooms. The flowers are excellent for cutting, and make a splendid show in vases, and lasting a long time in water.

The same may be said of the German and Japanese species, both of which are magnificent, the last-named producing blooms from 6 to 8 inches across. The varieties among these are great, every year seeing fresh importations from that distant land; and in this country they seed and cross readily, and

new sorts are continually being raised in that way.

The Japanese Irises do best in moist loose soil, sending their roots deeply into the earth. Iris germanica, although the commonest of Irises, is not the best striking, and the effect of masses of the plants is very fine. The plants will succeed almost anywhere, but, like other plants, they pay well for good cultivation, spreading rapidly. Their increase is easy by division of the roots, which may be effected at almost any season, as the fleshy roots (rhizomes) are very tenacious of life, and by the exercise of ordinary care in planting, every piece will grow. The way in which they look best is in large beds or groups; and when planted in that way it is an easy matter to top-dress the plants with rich mould—a great help to them in making their growth. *J. S.*

PLANTS AND THEIR CULTURE.

GREENHOUSE PLANTS.—The *Amaryllis* should now have light in plenty to ripen their bulbs, and late-flowering bulbs should be afforded weak manure to assist growth. These bulbs do well on a shelf in ainery. The seedlings of *Amaryllis* may be put in an intermediate-house, keeping them free from red-spider and thrips, and encouraging them to grow freely. Keep hybrid *Rhododendrons* in a warm, moist corner of the greenhouse, syringing them three or four times daily. If these plants are well syringed, and the underside of the foliage made wet, they will not be troubled by insects, and will give trusses of bloom in the autumn months.

Camellias and *Azalea indica* should be shut up early in the afternoon to encourage growth; and, in the case of large *Camellias*, planted out, a dressing of soot once in a month, well watered into the soil, will be found beneficial. Soot-water may be used for plants in pots. *Azaleas* will be benefited by doses of Clay's Fertiliser, given occasionally. The forced plants which may have completed their growth may be removed to a cool house, and in a short time afterwards plunged in a sheltered spot in the open, that is rather shady, but not overhung with trees, syringing them in fine weather. If the pots are not plunged, they should be protected from the sun by being put into pots of a larger size.

Berrias requiring shifting should be attended to, not over-potting them. *Epacris* growing freely should not be shaded, as this induces weak growth. *Begonias* may be shifted. The tuberous-rooted species require plenty of space to grow, and a cool house to prevent drawing of the stems. *Statice* will now take abundant supplies of moisture, and sometimes liquid manure, and when in bloom, overhead syringing must be discontinued, and, if greenfly be troublesome, an occasional sponging of the undersides of the foliage with tobacco-water will keep the plants clean. Smaller plants may be shifted before becoming pot-bound—these plants will give good bloom in the autumn.

Kaloesanthes should get a light place and some stimulus to growth, and be stopped to encourage the side growth. The early plants of *Celosias* will have filled their pots with roots, and will require liberal treatment. Later sowing of *Celosias* should be well syringed, and shifted when necessary. Another sowing made now will be useful in the autumn, and the plants may be grown in cold frames. *Cockscombs* need much the same treatment; but I do not advise these for employment in the autumn. *Fuchsias* should be shifted on as required, stopping the shoots of those wanted for late blooming. Cuttings of *Fuchsias* inserted singly in small pots, or three in a 60-pot, make plants which will be useful in the late autumn. Liquid-manure should be afforded all well-rooted large plants showing bloom. The late-flowering *Pelargoniums* will require the same treatment if they are to make good trusses. The double and single-flowered Ivy-leaved *Pelargonium*, if in small pots may be shifted, and a few sticks and ties given them for support. Winter blooming plants should

get their final shift, and be placed in the open air with full exposure to the sun.

Chrysanthemums, shifted into their flowering-pots, require ample space when standing in their summer quarters, and staking the plants must be attended to, the small stakes being removed if there are any. *Geo. Wyles, Lion House, Brentford, W.*

FRUITS UNDER GLASS.

THE ORCHARD HOUSE.—The early fruit in this division will probably be ripe if not already gathered, and when that is the case means should be taken to get the wood thoroughly matured, not by the withholding of water and liquid manure from the roots, but by increased ventilation, or, better still, the entire removal of the lights. Give the trees a thorough washing with the engine, and strive to maintain the old foliage in a healthy condition as long as possible. As soon as the fruit is gathered, prune away useless spray and any unfruitful wood, and pinch in gross shoots, so as to benefit the weaker ones. Fire heat is no longer necessary. Trees in pots may be removed to the open air and plunged in coal-ashes or tree-leaves, in a sunny position, top-dressing them with turf and rotten manure, and affording them abundance of water at the root.

In succession houses, plenty of atmospheric moisture will be required whilst the fruit is stoning and swelling, and the presence of mildew must be keenly watched for, it being very prevalent in these late fruit-houses. Dredging with powders of sulphur, repeated at short intervals, is the best remedy for mildew, but the sulphur must be fresh and powdery. Syringe the trees once daily, but endeavour to have the foliage dry before nightfall by keeping up a gentle circulation of the air.

In orchard-houses the fruits of Peaches, &c., may be retarded till October—that is fully as late as on walls outside. Check green-fly and red-spider by the frequent use of soapy-water or diluted tobacco-water and the garden-engine, or tobacco-powder may be puffed on to the aphids on their first appearance. Ripe Cherries may be kept on trees in pots for some time, if a dry atmosphere be maintained.

Plums require the same kind of treatment as Peaches, but the flavour is brought out more fully if the plants are plunged outside to ripen.

The early Green Gages now ripening should have no more stimulus than that afforded by clear water: the top-dressings should be renewed as often as the roots take possession of them.

Melons.—Sow seeds fortnightly, and pot on into 6 or 8-inch pots in strong gritty loam. These plants will take the place of those now ripening their fruits. Prepare beds for replanting, and thoroughly cleanse the house or pit, whitewashing walls with hot lime and sulphur, and painting the ironwork, wires, &c., with petroleum. Clear out the soil, plant out on hillocks of fresh loam made firm, keeping the collar of the plants well above the surface. Stake, water, and afford the plants a moist atmosphere of 75° to 85°, and 10° more with sun-heat, the bottom-heat being about 80°. Crops may be taken at this time of year, say, of four to six Melons per plant, and moderate-sized fruits from 2 to 1 lb., each are generally of better flavour than over-fed monsters. Allow no crowding of laterals, and preserve the old leaves healthy to the finish, and avoid checks by severe pruning; but rather go over the plants on alternate days. The above will hold good for Melons on dung-beds, but a stagnant atmosphere must be avoided, or canker will appear. If it appear, rub fresh-slaked lime repeatedly on the parts affected, and as a further precaution, put a handful of charcoal-dust around the collar of the plant, train the bine thinly over a layer of old pea-sticks, thin out useless laterals at short intervals, and elevate the fruit above the foliage as soon as it is set. Syringe the frames according to the weather, and top-dress the beds with loam when the roots make their appearance. Keep a steady bottom-heat of 80° by turning over the linings when the heat declines much, adding a little fresh previously prepared material. One bushel of gritty calcareous loam, with a double handful of bone-meal in each plant will, with top-dressings, grow Melons in hot beds to perfection. Ventilation should be judiciously given day and night, in order that the bine may grow wiry with short stout leaf-stalks, such plants nearly always setting their fruit well. *W. Curran, Madresfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

WALL TREES.—The spurs of Pear, Plum, and Apple trees, when aged, often grow to a great length from the wall and much of the benefit trees derive from being trained on walls is lost. The practice to leave at each pruning a little more wood on the spurs, so as to gain in bloom, is the cause of this. At this time of year, when it can be seen where the fruits are, it is a good plan to cut close to the branches any of those long spurs which are destitute of fruits, and from the base fresh growths will usually start, and make fruitful spurs the next year. Trees to be kept fruitful in all parts must have a succession of young wood coming on in various stages, young branches being laid in whenever vacancies occur, but only where they will get full exposure. Plants are greatly benefited by the cutting away of unfruitful spurs, and laying in of fresh shoots annually. I am inclined to think that it is the safest time to prune all kinds of stone fruit trees when they are in full leaf, but carefully avoiding too great severity. Pinching of the shoots in summer is much preferable to excessive winter pruning, and may be made to take its place in great measure.

Apples, Pears, Plums, all kinds of Cherries, except Morellos, also some kinds of Apricots, bear their fruit on spurs either naturally long or short, and it is necessary that those which grow to a great length should, as a rule, be stopped at the fourth or fifth leaf; if stopped closer than this, the buds close home will break into new growth, instead of developing into fruit-buds. When stopping has been once done at the distance named, any further growth at this season may be stopped at the first joint, and this stopping may be repeated as often as is necessary. If, as sometimes will happen, new shoots are left of too great a length, or not stopped, do not remove such all at once, as that would give the trees a check, but take off a few of them at intervals of three days. *A. Evans, Lytle Hill, Haslemere.*

THE KITCHEN GARDEN.

SEAKALE.—These should be kept clean and free of weeds by hoeing, and be well supplied with strong liquid manure, the application on light soil being very beneficial to the crop. A rich deep soil and full exposure suit the plant, and on such no difficulty is experienced in getting stout well-tipped crowns in one season, and the poorer the soil, the more liberal must be the feeding of the plants, and the thinning out of surplus buds on the crowns, and without which another season's growth will be required before it is fit to force. Remove every flower-head from the old plants, and those spring-planted should be carefully examined, pulling off the weak growths, and leaving but one to each root. Some gardeners plant other kinds of vegetables between the rows of Seakale, which occupy the land during the earlier part of the first year, but this should not be done.

Peas.—In warm localities, Peas may be sown as late as the 21st of the present month, and if the weather be fine to a late period in the autumn plenty of good pods may be expected; but, as a rule, about the 1st is the latest time at which to sow the tall varieties of Peas, and second early varieties afterwards. The earliest varieties may be sown as late as the beginning of July, but it is seldom that small Peas are sown for late in the year; and, moreover, the Marrowfat Peas from the June sowings last until cut down by frost.

Spinach.—In dry weather the seed should be sown on cool aspects in beds by itself. There is no need for digging the ground after other crops have been cleared off for good Spinach, if it be in good heart, drills being drawn just deep enough for the covering up of the seed. This is quite enough for this evanescent crop on light soils, and for several other crops we do not believe there is anything to be gained by digging so frequently as we do.

French Beans.—At intervals of a fortnight to three weeks, sowings of these should be made in amount according to demand. The plants on warm borders will require earthing up, whilst Canadian Wonder or Red Flageolet, if sown on ground in good heart, may be slightly supported with short twiggy branches. The plants may be syringed in the afternoon in dry weather, so as to check red-spider. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	JUNE 24	Royal Horticultural Society: Fruit, Floral, and Scientific Committee and Exhibition of Tea Roses, by the National Rose Society.
THURSDAY,	JUNE 26	Royal Horticultural Society: Floral Fairs and Feast of Flowers.
FRIDAY,	JUNE 27	British Fruit Growers' Association: Strawberry Conference at Royal Aquarium.

SHOWS.

TUESDAY,	JUNE 24	National Rose Society: Exhibition of Tees, at the Royal Horticultural Society's Meeting, Westminster.
WEDNESDAY,	JUNE 25	Royal Horticultural Society of Jersey, Richmond (Sarrey).
FRIDAY,	JUNE 27	Royal Aquarium, Westminster, with National Pink Society (two days).
SATURDAY,	JUNE 28	Delegates, Eitham.

SALES.

TUESDAY,	JUNE 24	First Portion of the Studley House Collection of Orchids, at Prothrope & Morris' Rooms (two days).
THURSDAY,	JUNE 26	Orchids in Flower, and Imported lots, 94,000 Kent's Seeds, &c., at Stevens' Rooms.
FRIDAY,	JUNE 27	Imported and Established Orchids, at Prothrope & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62° 1.

The Gardeners' Benevolent.

ONCE again we have the pleasure of signalling a great success for this tried Institution. Mr. HARRY VEITCH is as popular as a man can be, and well he deserves his popularity. Mr. CUTLER—though it is quite unnecessary to say a word about him—is a secretary there is none to rival, and his gentle persuasiveness (he himself calls it "cheek," but we do not find that word in the dictionary bearing any such significance), is such that few can resist and none resent his appeals. At any rate, between the two gentlemen, who, of course, are aided by local secretaries and others anxious to help the good work, a sum of well-nigh £3000 was secured at the late festival for the benefit of those infirm gardeners who have had the foresight in their working-days to make provision for the future, and to contribute, while they were able, their mite in relief of the necessities of their brethren. The principles of such an Institution need no advocacy; nor, we are thankful to say, does their application to practice. The Institution is thoroughly well managed, and amply deserves the support of the gardeners of this country: that it needs it, is shown by the fact that no fewer than sixteen persons were of necessity left out at the late election. The festival took place while our last week's number was passing through the press, too late to enable us to take note of it in that issue; but we can now

append a short account of the proceedings from our own reporter:—

The fifty-first anniversary festival of this excellent institution was held at the "Albion," Aldersgate Street, on Thursday last week, and the popular chairman of the occasion, Mr. HARRY J. VEITCH, must be congratulated on its being one of the most successful gatherings which have ever taken place. A large company was present from all parts of the kingdom, and Continental horticulture was represented by M. de GRAAFF, of Leiden, and M. D'HAENE, of Ghent. The chairman made a touching appeal on behalf of those gardeners whose lot in life has been a hard one: and in support of his appeal he gave an outline of the doings of the institution from its commencement, now over half a century ago, up to the present time. In 1839 their income was only £126, out of which one pensioner was supported; but so rapidly have matters advanced, that now no fewer than 154 pensioners find relief in their old age. Forty years ago, £493 were paid in pensions, whereas last year the amount reached £2,348. During the same period, the annual subscriptions had increased from £542 to £1,328. The chairman alluded to the excellent services rendered by their secretary, Mr. CUTLER, who had contrived to reduce the expenses of management from 20 per cent. in 1850, to only 12 per cent. in 1889. As striking evidence of the advantage of being a member of the institution, the chairman caused some merriment by stating that they had on their books a pensioner who is 102 years of age, and who has received in pensions no less a sum than £490, in return for subscriptions amounting to 18 guineas, and the whole company agreed with the chairman's remark that that was not a very bad investment. He also dwelt on the fraternal feeling which exists between gardeners, and read two letters—one from a man with ten children, enclosing £2 15s., and another from a man whose wife had been under the doctor's hands for nine years, and himself for two years, and yet who had managed to send £1 3s. 6d. The reading of these letters evoked well-merited applause. Having dwelt upon the bright side of the picture, the chairman cleverly alluded many reasons why the institution was deserving of all support, and stated that, large as was their income, they wanted still more to provide for the sixteen persons who were waiting election. The result of the chairman's exertions, with the assistance of the stewards, represented the substantial sum of nearly £3,000, of which, it is pleasant to reflect, the gardeners themselves of the United Kingdom gave close upon £800. Among the other speakers were Mr. H. SHERWOOD, vice-president and trustee; Mr. THURSELTON DYER, Director of the Gardens, Kew, who expressed his admiration of the self-reliance, intelligence and skill exhibited by English gardeners; Mr. SHIRLEY HUNTER, who in a characteristically humorous speech, in proposing the toast of the President and Vice-president of the institution, incidentally mentioned that the Duke of WESTMINSTER had promised £1,000 towards the Horticultural Hall; Mr. H. J. ADAMS; Mr. DRISCOLL, Chester; M. de GRAAFF, whom the chairman described as the king of Amaryllis growers; M. D'HAENE, Mr. PARKINSON, Mr. MURRO, and Mr. WEBBER. The chairman, in giving the last toast of the evening, "To our next merry meeting," expressed the hope that the next festival would prove even more successful than that one, as Mr. EDMUND YATES had promised to preside. The pleasure experienced at the dinner was largely contributed to by the singing of Miss ETHEL WYNN, Miss MARY BEVAL, Mr. J. BARTLETT, and Mr. R. HILTON. Mr. R. F. KINKEP was pianist. After the dinner, the chairman gave each of the lady artists a gold bracelet, as a *souvenir* of the occasion; and we must not omit to mention that most of the beautiful dessert was the present of Mrs. H. J. VEITCH.

THE GARDENERS' ORPHAN FUND.—A special meeting of the committee was held at the Caledonian Hotel, Adelphi, on the 13th inst. Mr. JOHN LING, presiding. The Hon. Secretary, Mr. A. F. BARRON,

reported that the chairman of the committee, Mr. GEORGE DEAL, was in a very critical state of health, an announcement received with the greatest regret by the committee. The balance at the Bank was stated to be £518 12s. 4d., Mr. BARRON reporting that a very large proportion of the annual subscriptions had been paid. A financial statement in regard to the Covent Garden *fiite* was then submitted, showing a profit of £170. The sum received by means of collecting boxes at the *fiite* was £20 3s. It was unanimously resolved that thirty-four special life votes, in accordance with the amended rule XII, § b, be placed at the disposal of the sub-committee of standholders, appointed to assist in carrying out the *fiite*. A hearty vote of thanks was passed to the standholders for making such an admirable display. Several details of the coming annual dinner were considered. Later on, there was a meeting of the joint committee for the *fiite*, Mr. ASBEE presiding.

COMPRESSED TEA.—The *Kew Bulletin* for June contains an account of the manufacture of compressed tea at Hankow. This tea is in use throughout Russian Siberia, and is made of tea dust compressed by steam power, and differs from the brick tea of Tibet, which is made of the entire leaves pressed together. The Timber trees of the Straits Settlements are next passed in review, the notice being founded on the collections of the late Dr. MAINGAY. The remainder of the part is taken up with correspondence, showing the desirability of extending the cultivation of Cotton in West African colonies.

MR. J. G. BAKER.—Mr. J. G. BAKER, F.R.S., has been appointed Keeper of the Herbarium and Library at the Royal Gardens, Kew, in place of Prof. OLIVER, who has resigned. Mr. BAKER has held the post of First Assistant in the establishment for twenty-four years, having been appointed in January, 1866. Mr. BAKER'S valuable services to horticulture, and his never failing willingness to help those who appeal to his knowledge, have been so well tested that this appointment will be hailed with great satisfaction.

HYDE PARK.—There is at the present time no finer floral sight in London than is presented by the beds and solitary plants of hybrid Rhododendrons and Pontic Azaleas, planted on the soft green turf on the north side of Rotten Row. The plants are from Mr. ANTHONY WATERER'S famous American Nurseries, Knap Hill, Surrey, and have been chosen with an eye to harmonious yet brilliant colouring. The solitary plants, often measuring 10 feet in height, and as much through, consist chiefly of *R. ponticum* in variety, whilst the finer Rhododendrons, and the Azaleas, now a little past their best, are disposed with much good taste in beds of a variety of shapes, and nearly always of large extent.

NATIONAL ROSE SOCIETY.—The annual dinner, heretofore held in December, the date of the Society's formation, will this year take place on Tuesday, June 24, at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, at 6 p.m. The chair will be taken by the very reverend the Dean of ROCHESTER. A large attendance is expected.

PRESENTATION OF PRIZES AT THE HORTICULTURAL COLLEGE, SWANLEY.—The half-yearly distribution of prizes took place at the above college on Friday, the 13th inst. The chair was taken by Mr. J. C. JOHNSON, J.P., who was supported by Mr. JNO. McDUGALL, M.L.C.C., Prof. CHESHIRE, and Mr. A. H. BOND, Resident Director. Mr. J. PENTLAND SMITH (Science Lecturer), and Mr. C. W. H. GREAVES (Secretary), were also on the platform. After an address to the students by Mr. JOHNSON, and speeches by Prof. CHESHIRE and Mr. BOND, the prizes were presented to those who had been successful at the sessional examinations recently held. Prizes were also given for the best practical work in the glass-houses, cultivated plots, &c. In the course of his remarks, the Resident Director referred to the

VIEW IN THE PUBLIC GARDENS AT COPPET

methods adopted at the college, and the practical results of such training, pointing to the success of those who had not neglected fruit-growing, and other branches of horticulture in their farming operations, as evidence of the opening which horticulture affords to young men at the present time. The distribution of prizes was followed by an entertainment given by the students.

THE CLYDE DISASTER FUND.—It will be in the recollection of our readers that a fund was opened, some time since, for the benefit of the widows and families of Mr. HALL and Mr. FRASER, who by a most unfortunate accident were drowned in the Clyde, in 1878 last. The total amount collected was £499 17s. 6d.; the expenses for printing appeals, postage, &c., amounted to 95 17s. 6d., thence leaving a balance of £154, which has been equally divided between the two families, and the amounts invested in Grand Trunk Railway of Canada 4 per Cent. Debenture Stock. Mr. WILLIAM THOMSON, jun., of Clovenfords, N.B., has kindly consented to act as joint trustee with Mrs. FRASER for the sum invested for her benefit. The thanks of the committee, says Mr. F. HORNSTAN, the hon. secretary, are due to Mr. HARRY VETTER and Mr. W. H. PROUTHERO, for the great pains they have taken in securing such a good and safe investment, and we trust the subscribers will be well satisfied with the result.

LINNEAN SOCIETY.—At a meeting of the above Society, on June 5, Prof. CHARLES STEWARD, President in the chair, Messrs. HARVEY and W. F. KIRBY were admitted, and Messrs. W. H. BEECHY and S. GASKING were elected Fellows of the Society. The President then nominated as Vice-Presidents for the year, Messrs. W. CARRUTHERS, P. MARTIN DUNCAN, J. G. BAKER, and F. CRISP. Mr. H. LITTLE exhibited and made some remarks upon the remarkable Aroid, *Amorphophallus Titanum*, which had flowered at Kew last year. Mr. James Groves exhibited a specimen of an *Orobanchae* parasitic upon a *Pelargonium*. The following papers were then read and discussed:—1, Mr. G. F. SCOTT ELLIOTT, "On a Collection of Plants made by him in Madagascar." 2, Rev. G. HENSLOW, "On Weismann's Theory of Heredity applied to Plants;" 3, Prof. WINDLE, "Teratological Evidence as to Heredity of Acquired Conditions;" 4, Mr. HARVEY GIBSON, "On the Development of the Leprosy in *Khallochroton Rothii*, Nagasaki;" 5, "On the Position of *Chantrelia*, with a Description of a New Species," by Mr. GEORGE MURRAY and Miss E. BAKER; 6, Miss A. L. SMITH, "On the Development of the Cystocarp in *Callophyllis laciniata*;" and 7, Mr. B. CARRUTHERS, "On the cystocarps of some Genera of *Florida*."

GLOXINIAS AT MESSRS. J. VEITCH & SONS, CHELSEA.—A very beautiful strain of erect-flowering Gloxinias is now in flower at this establishment. By experiments in hybridising, long-continued, a plant has been secured with horizontally-posed foliage, of much robustness of growth, measuring, in some cases, 2 feet across the entire plant, and sometimes prettily marbled, and numerous flowers coming in a mass on stout footstalks, and showing well above the foliage. The plants now in bloom consist of tubers which flowered last year, and a younger generation from seed or leaf-cuttings. We specify a few of the more striking. *Virginalis*, pure white—this variety has occasionally carried 120 flowers, the usual number for this and others being sixty to seventy. Spotted flowers are now getting beautifully varied in colours; reticulated ones in crimson and violet on white grounds are beginning to show themselves in the seedlings, and are thought much of. *Orion* is a lily-like flower of a new class, with a spotted margin; *Celia* has a broad margin of purple, the throat being white; *Cygnit* is white, with a violet-shaded margin to the segments; *The Moor*, dark purple, shaded margin, and short tube; *Comet*, bright crimson—a very fine flower; *Orestes*, deep

crimson, with a margin of a lighter shade of colour; *Irena*, a cheerful shade of scarlet, with a white throat; *Mrs. Atkinson*, spotted with mauve-purple on white; and *Nestor*, fiery red, and spotted in the white throat—the best flower of the class. The flowers of these Gloxinias require to be pulled off the plants, in this respect differing from older types, which, as everyone knows, lost their flowers on the least movement, a fact due, probably, to the impossibility of these newer types of flowers being self-impregnated.

HORTICULTURAL EXHIBITION FIXTURES.—The Aylesbury Floral and Horticultural Society holds its annual exhibition on July 3; Kettering and District Horticultural Society on July 7, this being Feast Monday in this town, and a general holiday with the townspeople; Waltham Abbey and District on July 24; the Cardiff—formerly the Glamorganshire—Horticultural Society, on August 13; and the annual exhibition of Taunton Deane Horticultural Society, on August 11.

FRUIT SHOW IN THE CITY.—On the invitation of Sir JAMES WHITEHEAD, Bart., Master of the Fruiterers' Company, the following gentlemen assembled in the Guildhall on Monday afternoon last to confer with a Committee of the Company on the advisability of holding an exhibition of home-grown fruit in the City of London during the ensuing autumn—namely, Messrs. A. F. BARRON, G. BUNYARD, J. CHEAL, J. EMERSON, SHIRLEY HIBBERD, FAUNCE DE LAUNE, J. LAING, G. PAUL, T. F. RIVERS, A. H. SNEE, H. TURNER, and J. WRIGHT. Dr. FOTHERBY, R. S. MASON, and H. R. WILLIAMS, Esqs., Past Masters, with Mr. O. C. T. EAGLETON, were present on the occasion. Sir J. WHITEHEAD, who presided, explained the objects in view, and deplored the diminishing quantity of hardy fruits raised by cottagers and farmers. During his Mayoralty last year, he made an appeal to the public to raise a sufficient fund for yielding an annual income to be applied to the furtherance of that object. At the present time, subscriptions amounted to about £1500. He wished to draw public attention to the desire of the Fruiterers' Company to increase that fund, and the best method of doing so was the question they had to consider. The proposition to hold a fruit show under the Company's auspices in the City had been favourably received, and if it was considered practicable by the practical men around him, he should do his best, as would his colleagues, to make it a success. He wished it to be distinctly understood that they had no idea of being in opposition to, or acting in conflict with, any existing society or association which was working to the same good end; but the Fruiterers' Company had done a little, and desired to do more, and he therefore asked for co-operation and suggestions. The first question was, whether there would be any fruit this year? and that having been satisfactorily disposed of, a conversation ensued on the advisability of the Royal Horticultural Society assisting in the project. Mr. G. PAUL remarking that he believed the Council would regard the matter favourably, but he had no authority to give any definite pledge. The following resolution, proposed by Mr. SNEE, seconded by Mr. RIVERS, and supported by Mr. HIBBERD, was passed unanimously:—"That this meeting of a Committee of the Fruiterers' Company and of practical fruit growers, is of opinion that an exhibition of home-grown fruit, implements, &c., held in the City of London in the autumn of the present year, would tend to increase the interest of the general public in the cultivation of fruit in our homesteads and cottage gardens."

CHAMBRE SYNDICALE OF GHENT.—On the occasion of the monthly meeting of the above Society on the 9th inst., the following plants received Certificates of merit:—*Vanda Parishii* Mariottiana, a very distinct variety, shown by MM. Edm. Vervaeck & Co.; *Cupania elegantissima*, shown by M. A. Van Geert; *C. elegantissima*, shown by M. Louis Van Houtte; *Cattleya Mossiae* var. (unanimously), a very fine

flower, of the darkest hue, and a splendid plant; *Cypripedium Fraseri*, *C. hirsutissimum* X. *C. barbatum*, and flowering in Europe for the first time; and *Odontoglossum* species, raised from *crispum* or *Pescatorei*, which were all shown by M. Jules Hye—*Miltonia Leopoldina* (Reichenbach), shown by M. Ed. Pynaert, a splendid flower, which will be figured shortly in the *Revue de l'Horticulture Belge et Etrangère*; the flowers are deep rose, of unusual size, their most distinctive feature being the triangular blotch of deep purple which is seen at the base of the lip. *Odontoglossum Pescatorei*, remarkably distinct; *Acridis Godefroeyi*, with petals and sepals bordered with rosy-carmine, a very dark lip, and a border of dark rose, shown by M. A. Van Insechoot; and *Cattleya labiata* Warneri, of deep colour and well-developed lip, shown by MM. Boelens frères. Cultural Certificates were awarded (1), to *Cattleya Mossiae* Reineckiana, from M. J. Hye; (2), to *Cypripedium Roebelinii*, from the same grower; and (3), to *Lilium gantungum*, from MM. Boelens, which bore fourteen flowers on a stem of unusual size. A Certificate of Merit for novelty was accorded to *Cupania elegantissima*, shown by the establishments of M. Louis Van Houtte, and by M. Aug. van Geert. Honourable mention was accorded to *Vanda tricolor* and *Cattleya Warneri*, of MM. Vervaeck & Co.; to the *Nanodes Caput Medusae*, of M. Schmitz; and to a variety of *Odontoglossum guttatum*, shown by M. J. Hye; to *Cattleya gigas*, from M. D. Haene; to *Epidendrum Stamfordianum* var. *Wallisii*, from M. Van Insechoot; to *Odontoglossum vexillarium*, from MM. Boelens; to *Adiantum venustum*, shown by M. Spue-Vandermeulen. *C. de B.*

UTILISATION OF BOTANIC GARDENS.—We learn from the *Scottish Leader*, of June 10, that a departmental committee has been appointed by the Government to inquire into the whole working of the Royal Botanic Garden and Arboretum, Edinburgh. The chief object of this committee will be to ascertain how these institutions may best be utilised in the interests of education and the public generally, and what may be necessary to make them more useful as a means for the better study of botany. In this connection the establishment of a forestry school for Scotland will form a special subject of inquiry. The committee will hold its sittings in Edinburgh during the month of August, and its report will, it is expected, be issued before the end of the year.

MR. WALTER GARDINER.—At a meeting of the Master and Fellows of Clare College, held recently, the tenure of the Fellowship of Mr. WALTER GARDINER, M.A., F.R.S., was extended for a further period of six years, on account of his marked service to botanical science.

EARLY POTATOS.—Mr. B. GIRST, gardener to Lady HAMOND GRYME, of Norlands, Great Yarmouth, dug Sutton's Ringleader Potato on May 7 in the open border. He considers this variety to be the earliest Potato in cultivation, and many other authorities have expressed a like opinion.

"EPPING FOREST MISMANAGEMENT."—A *brochure* is being circulated under the above title, consisting of reports and criticisms by Sir T. FOWLER BUXTON and Mr. E. NORTH BUXTON, verifiers of the Forest; Professor BOULGER, Professor MELDOLA, Mr. A. J. BERRIORS, Mr. Deputy BERRIORS, and the Forest Rambler's Club: the object of publishing the pamphlet being to bring before the people of London—and it is these who are mainly concerned—the various acts of forest mismanagement perpetrated; together with a few indications of improved methods of dealing with forestry matters.

LILIES.—We are reminded of the advent of the Lily season by the receipt of a package from Mr. WARE. On the same ground that the Frenchman deprecated "*tonjours perdrix*," and the Englishman expressed his dissatisfaction at the constant recurrence of rabbits, we own to a feeling of satisfac-

tion that the Daffodils and the Chrysanthos. (excuse the abbreviation—it is more correct than "mums") are temporarily de-throned. We shall be glad enough to see them by-and-by, but in the meantime we bow to the rising stars, Roses and Lilies, and take down with renewed pleasure ELVES' superb *Monograph* and PAUL'S *Rose Garden* from the shelves, where they have remained undisturbed for the winter. Mr. WAKE sends us a beautiful form of *Lilium Washingtonianum*, in which the lilac-flashed segments are prettily spotted with minute purple dots, especially towards the throat of the flower; and a pretty form of *L. pardalinum*, called *maritimum*.

DRAWINGS OF ORCHIDS.—Messes. PROTHORP & MORRIS recently sold a collection of 286 life-size Orchid drawings by Durham, in twenty-two volumes, for £350. A *Cattleya Mossia alba* fetched £30 guineas.

THE LONDON AGRICULTURAL SEED TRADE ASSOCIATION held its annual dinner on June 6, when the chair was ably filled by N. SHEPWOOD, Esq. After the usual loyal toasts having been drunk, the Chairman gave the toast of the evening, "Prosperity to the London Agricultural Seed Trade Association." He remarked that the London Agricultural Seed Trade Association during the years it has existed has done an immense amount of real good work, mainly in forming rules in the interest of the trade, which, hitherto, had been carried on in a most hap-hazard manner, and also in settling disputes which are constantly arising. He could not too strongly speak on the subject, for men often turn to law and spend large sums of money over trifling matters that could be settled in an easy and inexpensive manner by the Arbitration Committee. Then again, the Society has adopted means to stop seed adulteration, notably the colouring and dotting of inferior white Clover from the Continent, which has gone on to an enormous extent. He strongly advocated an Association of this kind which brings the members together in a pleasant and social manner for the interchange of opinions, and which tends to smooth the friction often arising in business matters. The Society has also drawn attention to the practice of naming foreign grown seed similar to English grown, and in making an effort to compel sellers to faithfully describe the seeds they sell; and if farmers would only pay more attention to the quality when buying, the work of the Association would be rendered much easier.

ROSE SHOWS IN 1890.—Mr. E. MAWLEY, Rosebank, Berkhamsted, Herts, kindly contributes the following list of show fixtures of the present season:—June 19, Ryde; 21, Drill Hall, Westminster (N.R.S.); 25, Richmond (Surrey); 27, Royal Aquarium, Westminster; 28, Eltham and Reigate. July 1, Canterbury, Colchester, Hereford, Sutton; 2, Bagshot, Brockham, Croydon, Dursley, Hitchin; 3, Bath, Farningham, Norwich; 5, Crystal Palace (N.R.S.); 8, Gloucester, Ipswich, Winchester*; 9, Brighton*, Diss, Baling, Tambridge Wells; 10, Birkenhead, Woodbridge, Worskop; 11, Uxerstone; 12, New Brighton; 15, Christleton; 17, Birmingham (N.R.S.), Bedford, Helensburgh; 22, Tibshelf; 24, Salterhebble (Halifax). August 2, Ripley. In the case of Brighton and Winchester (marked *), where the exhibitions extend over more than one day, the date of the first day's show only is given.

MR. A. G. CATT.—Those of our readers who enjoy the acquaintance of Mr. Carr, the contributor of the Orchid Calendar at the present time in these pages, will learn with regret of the death of his second eldest son by drowning, which occurred accidentally on the 14th inst.

STRAWBERRIES.—As showing the comparative earliness of various Strawberries, Mr. SMITH, of Newport, Monmouthshire, tells us that in Farmwood Nursery, King of the Earlys was picked on June 2, Captain and a few Garibaldi on June 5, Dr. Hogg on June 8, and on June 16, 60 lb. weight

of the above varieties. James Veitch and the Duchess of Edinburgh are also changing colour, and Cherries will be ripe before the week is out. These nurseries are situated on the south side of a steep hill, and catch the full force of the wind from the Bristol Channel; the soil is stiff, resting on a clay subsoil, with limestone beneath.

STOCK-TAKING: MAY.—The Trade and Navigation Returns for the month of May, published on Saturday last, are of the usual voluminous and interesting nature. We note that the imports for the month show a decrease of £1,491,403, and an increase in the amount of exports of £2,519,383, compared with May of 1889. We may note that for the five months there has been a decrease in the imports of £1,577,831, and an increase in the exports of £3,510,119, compared with the corresponding period of last year. The following is our usual extract from the summary of Imports from foreign countries and British possessions:—

	1889.	1890.	Difference.
Total value of imports	34,835,408	33,341,005	-1,494,403
§ I.—(A.) Articles of food and drink—			
free duty	11,192,716	11,409,916	+217,200
(B.)—do., dutiable	1,636,611	1,635,128	-1,483
§ VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	1,756,441	5,997,426	+4,240,985
§ VII.—Raw materials for sundry industries and manufactures (including wool, timber, ivory, wax, split, dressed; vegetable materials, for paper-making, &c.)	3,266,396	3,865,113	+598,717
§ IX.—Miscellaneous articles (including Coffee, Grass, Flax, Rape, Linseed) ...	397,972	1,056,243	+658,271
(B)—Parcel Post ...	32,971	34,365	+1,394

Taking stock at the time of that perhaps greatest of all great exhibitions held at South Kensington—the Colonial and Indian Exhibition—it was to be seen how rapid were the strides being taken by India and Ceylon in the matter of Tea growing and exporting to this country. The Trade Returns since that time are in evidence, and those of to-day show that the prophets were in the right, and that the glory was departing from China. China furnished the lessons for our Eastern planters, and these have been necessarily slowly but surely improved upon, whilst the Chinese growers appear to have stood still. The exports from the Chinese ports are decreasing just as those from Ceylon and India increase. Our readers will remember the Commission sent by the Government of China to the plantations of the British Indian "barbarians," and the report made on its return. Various recommendations were made with the view of saving Chinese trade, one being the sending of lecturers to England to prove the weakness of the new Teas as compared with the old—that the only genuine article was the Celestial. The lecturers have not yet been advertising themselves here, and the Returns go more and more against John Chinaman, who will have to put in practice what he saw done by his young competitors. The accompanying excerpt possesses its usual interest for market gardeners, and are probably read in connection with market prices:—

	1889.	1890.	Difference
§ II. Fruit:—			
Apples, raw bush.	63,554	20,118	-43,436
Unenumerated, raw	14,455	31,574	+17,119
Onions	350,146	327,186	-22,960
Potatoes cwt.	133,525	209,816	+76,291
Vegetables, raw, unenumerated Value	£4,865	£60,857	+£56,992

A word to the printers of the Trade Returns may not be out of place here. If the figures representing

"differences" are rightly printed, then the quantities imported are incorrect in one or two instances. This should be seen to, as the returns in the items noted are valueless, or worse.

HOOKE'S "ICONES PLANTARUM."—The first part of the eleventh volume has just been published (WILLIAMS & NORGATE). This volume is to be entirely devoted to Indian Orchids, of which some twenty-five are figured in the part before us. Some of them are highly curious and interesting, but not of a character to find favour with the Orchid Committee.

CREOSOTED TIMBER.—We occasionally receive complaints from gardeners and their employers concerning the injury done to plants when creosoted timber is employed in the construction of plant-houses, and the impossibility of minimising the injury by any known means. Mr. ARCHAULD MACFIE, gardener, Rosehaugh, Avoch, Ross-shire, writes, that his structures, consisting of Orchid and Melon-houses, vinerys, ferneries, are constructed with creosoted timber, which causes no injury to the plants contained in them, although the creosote oozes through the paint, and is very perceptible to the sense of smell. We should be glad to have the experience of gardeners and others who have had charge of plants in houses built of timber similarly treated.

MR. E. BENNETT.—Our energetic old correspondent and excellent gardener, writes that he has, in addition to the management of his two nurseries, undertaken the charge of the extensive gardens at Hatfield Grove, Uxbridge, where the glass houses are very numerous.

THE LATE J. VAIR.—This talented gardener to Lady DOROTHY NEVILLE at Dangsten, near Liss, was well known in his day to the horticultural world as the cultivator of the magnificent collection of plants, only rivalled by that at Kew, of which he had charge. An appeal made by Mr. EVANS, gardener to L. S. HOBSON, Esq., Lythe Hill, to his fellow-gardeners, to erect a head-stone over VAIR'S grave, has met with generous response, a sum of £1013s. 6d. having been subscribed. Of this amount, £6 have been expended in a grave-stone, 10s. in expenses, the balance, £38s. 6d., going to the Gardeners' Royal Benevolent Institution, to which Institution the deceased gardener was a subscriber for thirty-three years.

HARTLAND'S DAFFODILS.—Mr. HARTLAND has published under the above title a series of original illustrations, representing some forty of the best varieties, drawn by Miss GERTRUDE HARTLAND, and engraved by Mr. WELCH. The book is elegantly and tastefully got up, the paper cover representing the bark of the Silver Birch. No text of any kind accompanies the plates.

PLANT NOVENCLATURE.—An interesting example of "do as you please" is given in a recent number of the *Orchidophile*. There is a *Cypripedium* called *C. vittatum*; there is a variety of it called *C. vittatum breve*. This much is admitted. But it also appears that in spite of this, the plant is also known in gardens as *C. Binotii*, and this name is retained in the *Orchidophile*. The reasons given are (1), because the plant is well known in gardens under this name; (2), because M. BINOT has sent it to Europe under this name for the last twenty-five years; (3) because it was distributed under that name prior to 1876; and (4), because M. BINOT is a good fellow! These are very good reasons in the abstract, we do not contest them, we ask simply whether those reasons would not be equally well met by calling the plant in gardens *Cypripedium "Binot"* or *Binot's Cypripedium*? This case is so very simple—the mere omission of the final "i" would surely satisfy horticultural requirements, while it would violate no botanical rules, and create no confusion. In this case, at any rate, the orchidist is not asked to give up anything

except one letter at the end of the word. So long as a name does not make pretence to represent something which is incorrect, or a state of affairs which is not true, no one has any right to object. So long as it does the reverse, so long in the interest of convenience, not to say of law and order, ought a protest to be made.

THE BRITISH FRUIT GROWERS' ASSOCIATION.—The following papers will be read at the Strawberry Conference, to be held by the British Fruit Growers' Association, in the Library at the Royal Aquarium, Westminster, on Friday, June 27 next at 5 P.M., T. FRANCIS RIVERS, Esq., in the chair:—"The Origin of the Cultivated Strawberry," by Mr. STURLEY HIBBERD; "The Culture of Garden Strawberries," by Mr. JOHN WINGRO; "The Culture of Strawberries for Market," by Mr. G. BENDARD; "Seedling Strawberries," by Mr. THOMAS LANTON.

GREAT INTERNATIONAL HORTICULTURAL EXHIBITION. BERLIN.—We learn from the report of the Treasurer made at the meeting *des Vereins zur Beförderung des Gartenbaues*, on May 29, which appears in the *Gartenflora*, of June 15, that the total sum taken in the period from April 25 to May 8 the duration of the exhibition, amounted to 183,000 marks=£1130. The expenses were correspondingly high, still the Verein has been enabled to buy 51,000 marks Prussian Consols.

NEW FERNS.—At the last meeting of the Royal Horticultural Society, Messrs. CLARKE, of Altrincham, exhibited the following new Ferns:—

Pteris serrulata.—A form in which the frond had about five pairs of pinnae. The two lowermost pairs were divided nearly to the base, the remaining three pairs were undivided, the terminal segment divided, but on one side only, and about its middle into a solitary segment. All the segments were long and very narrow, gradually tapering to a fine point.

Gymnogramma ochracea.—An elegant form, in which the ultimate pinnales were greatly reduced in width, so that some of them were mere threads.

Pteris cretica.—A curious form with three pairs of pinnae; each pinna divides nearly to the base into two narrow, oblong obtuse segments, of which one was much smaller than the other. All the larger segments (but none of the smaller ones) were divided at the apex into a loose tuft of rounded wavy lobes overlapping at the margins.

THE ORCHIDÆENNE.—The twentieth meeting was held in Brussels on June 8, when 515 Orchids were then exhibited. Certificates were awarded as follows:—

Diplomas of Honour of the First Class.—To *Cypripedium Fraseri*, from M. J. Hye-Leyssen; to *Catasetum Rodriguezianum*, from M. Linden; to *Odontoglossum species nova*, from M. J. Hye-Leyssen; *O. species nova*, from M. J. Hye-Leyssen.

Certificates of Merit of the First Class.—To *Cattleya Reinckiana*, from M. J. Hye-Leyssen; to *C. Reinckiana*, from M. Peeters; to *C. Mossie* var., from M. Van Inschoot; to *C. Mossie* var., from M. J. Hye-Leyssen; to *Cypripedium Lawrenceanum* var. *hyanum*, from M. J. Hye-Leyssen; to *Phaius Henri*, from M. Van Inschoot; to *Cattleya Mossie* var. *alba*, from M. Peeters; to *Odontoglossum crispum* var. *album*, from M. Warocqué; to *O. c.* var. *Leopoldi*, from M. Warocqué; to *O. c.* var. *rotundiflorum*, from M. Linden; to *O. c.* var. *fastuosum*, from M. Linden; to *Cypripedium argus* var. *Moenii*, from M. le Comte de Bousies.

Certificates of Merit of the Second Class.—To *Cattleya Mendelii* var., from M. le Comte de Bousies; to *Odontoglossum crispum* var. *caudatum*, from M. Linden; to *Broughtonia sanguinea*, from M. Van Inschoot; to *Cypripedium leucorrhodum*, from M. Peeters.

Cultural Certificates of the First Class.—To *Lachnospurpurata* var. *alba*, from M. Wallaert; to *Odontoglossum luteo-purpureum*, from M. Warocqué; to *Vanda savis* var. *Rollisoni*, from M. Warocqué; to *Cypripedium Lowii*, from M. Warocqué; to *Miltontia vexillaria*, from M. Peeters.

Cultural Certificate of the Second Class.—To *Cattleya Mossie*, from M. Peeters.

The next will be held on Sunday, July 13.

GARDENING IN INDIA.

[SEE SUPPLEMENTARY SHEET.]

THERE seems to be a prevalent idea among those who have not been to the tropics, and especially India, that gardening there must be a very simple affair, just in the same way as some imagine that tigers prowled about the streets, and cobras meet you at every turn; but the reverse is actually the case: good gardens, like tigers, are, in fact, not plentiful, and it is possible to live in India a long time without ever seeing a cobra outside a snake-charmer's basket.

Before I went to India, I had similar erroneous notions, particularly as regards Indian vegetation; I fancied I was going to see a Kew Palm-house-like aspect everywhere; mighty Palms, and rampant climbers; in short, just like the choice "bits" of jungle scenery that travellers in the tropics are wont to beguile us by pen and pencil. It is true that when we entered Bombay's magnificent harbour at sunrise, and I saw the towering groves of Palmyras (*Borassus flabelliformis*), that stand like gaunt sentinels on the amphitheatre of hills overlooking the harbour, I began to think that the dream of my life of seeing a tropical jungle would soon be realised. The same day I visited the Victoria Gardens and others among the principal gardens of Bombay, and I was enchanted with all I saw, for though it was November, the gardens were at their climax of beauty; their spring-tide of flower, in fact, after the monsoon, as the long rainy season is termed.

I think it is pardonable in a young gardener if, on first seeing a tropical garden, he goes wild with delight, and otherwise shows signs of temporary insanity. I have a distinct recollection of being in that condition when I entered the Victoria Gardens in Bombay, and saw growing in the greatest luxuriance in the open air plants that from childhood I had been accustomed to see cribbed in pot, and confined in a glass-house. So great is the difference between pot-grown plants in a stove and those growing in unrestrained vigour in the tropics, that they are often scarcely recognisable, and I blushed at my ignorance when, on asking the names of certain plants, Mr. Carstenson, the Curator, mentioned the most familiar names. The things that struck me most were such well-known stove climbers as Bougainvilleas, Bignonias, Allamandas, Ipomoeas, Passifloras, which send their liesson shoots from tree to tree just as the Traveller's Joy and Honeysuckles do in our hedgerows, and the brilliant cockles they give to an Indian garden scene is quite indescribable—it must be seen to be understood. The groves of tall Palms give support to shade-loving Philodendrons and other clinging Aroids, and in the shade below grows a multitude of smaller things—Pancratiums, Crinum, Abacacias, various Bromeliads, Begonias, and such-like, while there is a dense lawn-like carpet of the creeping little Artillery plant, *Pilea muscosa*, or whatever its latest name may be. I could not better describe the Palm grove than by comparing it with the central part of the Palm-house at Kew, supposing the roof was away, and the big Palms spaced out more widely.

What we term "fine-foliage" plants are no less remarkable, especially the high-coloured shrubs, like Croton, Acalypha, Caladium, *Dracena*; for there they develop such rich tints, especially the Crotons, that even the famous Liverpool Croton growers could not approach. I saw a shrubby variety of Crotons—a hundred or more—planted in the full sun, close to a wall at one of the railway stations; and I thought I had never seen such a marvellous sight in the way of leaf-colour; and the sorts included most of the newest—all dense, symmetrically grown specimens.

I thought of Mr. Baines and his famous "elephant" specimens, the result of years of patient skill, when I saw in a simple four-court in the Bombay suburbs some gigantic specimens, faultless in training, and crowded with bloom, of *Ixoras*, *Jasminum sambac*, *Bignonia venusta*, *Bougainvillea lateritia*, *Petrea volubilis*, and others. The owner, a railway man

from Lancashire, seemed unaware that he was doing anything very remarkable; he liked flowers, and liked to see the front garden "look a bit smart."

It is not only in the Victoria Gardens that one sees such luxuriant vegetation, but you see it everywhere—in the city gardens, of which the Elphinstone Circle Garden is a noteworthy example; in the Fort, where European commercial life is carried on; as well as on the picturesque height known as Malabar Hill, where the wealthy natives as well as Europeans have their bungalows, and, in most instances, beautiful gardens about them; but all this is due to the perpetually moist atmosphere and high temperature that prevails throughout the year, so that when you leave the sea-girt island of Bombay and its Cocoa-nut woods, you enter upon quite different scenery whichever direction you take. Going south towards Madras, you have to climb the ghats, as the western range of mountains are called, and there you see Nature's gardening in its grandeur, until you reach Poonah, and beyond that city you pass through the trackless wastes of the Deccan. Going up country towards Guzerat, the train takes you through a marvellously rich agricultural country, where the fields of Cotton and cereals are measured by the square mile. On towards Baroda, you come to what is aptly called the "garden of India," where the rich farm lands are interspersed with magnificent timber trees, where the Tamarind and the Mango give a distinctive feature to the landscape, diversified now and again by natural groves of the Toddy Palm (*Phoenix sylvestris*) and Palmyras, and this kind of scenery goes on in a more or less varied way right through the vast stretches on to the Punjab and the North West.

It is thus that the stranger derives his first impressions of India, and if he enters it by the other great gateway, the opening scene is even more impressive as he goes 100 miles up the Hooghly before reaching Calcutta. The banks of the Hooghly are typical of an Indian jungle, abounding in vegetation of the wildest description, and where the tiger, moreover, is not a stranger.

The further you go inland the less tropical the vegetation becomes, and the more difficult it is to make and maintain gardens, and the difficulties attending gardening, in the sense that we understand the term, accounts for the comparative rarity of fine examples. These difficulties arise purely from climatic causes, the long period of drought and the excessive rainfall spread over a comparatively short period. It is, indeed, not an easy matter to maintain an inland garden in freshness from one monsoon to another, which interval varies from eight to nine months. But by the ordinary native system of irrigation, much may be done; and those who can afford a more costly system, can keep their lawns green throughout the year.

As regards the subject-matter of these discursive notes of gardening in India, I think it best to divide it, as methodical London did in his *Encyclopedia of Gardening*, where he treats on the state of gardening in different countries. His divisions are—gardening as an art of taste and design, and gardening as an art of culture. As regards India, so far as my scant knowledge goes, there is very little to say about one, and a great deal, more than I can go into here, about the other. About the gardens I saw, the majority exemplified very little design, and the tasteful bits resulted more from accident than design. Europeans unquestionably are leaving their marks everywhere about the country in the matter of gardens, as well as on the buildings, and everything else; but the want of intimate knowledge of the principles of design are too apparent. The fact is, that in India, as indeed in this country, too, everybody thinks that he can lay out a garden, a simple matter say they, what is there in it? The results too often show that there is a good deal in it. But in India this is more excusable, because professional gardeners are scarce, and very rarely you find a native capable of designing even a flower plot well. Consequently, you get the military officer or the civil servant with spare time, essaying

to do what he knows very little about; but for that matter he would build you a steam-engine or make a fiddle, for a man in India must be more or less a "Jack-of-all-trades." I heard of a German out there who qualified himself for a landscape gardener by being an expert at house-decorating, and sure enough he transferred his elegant scrolls and aimless contortions to the walks and roads of a public garden he designed. Among the gardens that stand out prominently as fine examples, are the great public gardens of Calcutta and Bombay, the botanical garden in the former place being probably the finest in the world; while remarkable also are the Government House gardens at Barrackpore, and the picturesque Eden Gardens. Those in the Nilgherries at Ootacamund and Bangalore, favoured as they are by a delightful mountain climate, are highly spoken of by everyone who has seen them. The gardens at Poona, which, like the other great centres has been long under the influence of the British, are famous throughout India, for the climate there favours the growth of plants that will not thrive in the plains. I was much pleased with the Government House garden at Ganesh Khind, which were for many years under the management of an old Kew student, Mr. Woodrow, now Professor of Botany at the College of Science. The Band garden, too, struck me much, both on account of its design—a series of terraces—and for the high keeping of it by a native superintendent.

At one time the best gardens were confined to British territory, but in future we shall have to go to the native States for fine gardens. Already great progress has been made, doubtless the outcome of the periodical visits to Europe of the native princes, who have seen for themselves what English gardening is. Among States that can boast of famous gardens is Oodeypore, under the direction of Mr. Storey, who has, I hear, done wonders in making the State gardens there what they are now. I have not yet seen them, but a friend who has travelled throughout India tells me that they are really fine, enriched by magnificent tree growth, and embellished in a costly yet tasteful way. I am told that the lakes alone are worth the 70 miles ride on camel-back to see, being of great extent, and have delightful surroundings. The view in the Oodeypore Gardens (see Supplement in present issue) shows a fountain of simple yet massive design; and doubtless Mr. Storey has it full of Water Lilies, that give such a charm to water basins in India. The trees in the background are Tamarinds, which are among the finest trees in India, as stately and massive as an Oak, yet as graceful as an Acacia. I have measured some with boles 27 feet in circumference. Noteworthy gardens in other States include that of Jeypor, over 70 acres in extent, designed by Dr. De Fabek; Durbunga, which was at one time under the direction of Mr. Maries, but who is now, I hear, doing a great deal in gardening at Gwalior, also a native State. There are also fine gardens at Patiala and Chikaid, while I hope that the various palace gardens and parks that I am designing and laying out for H.H. The Gaekwar of Baroda will in time compare with any in India. I have said nothing about native gardens pure and simple. Judging from what I have seen, there is very little to say about their design; the native idea of a garden is a square plot, with his bungalow in the centre of it. The plot varies in extent according to the importance of its owner, but there is no variation from the straight lines and symmetrical figures he delights to portray on the ground. After the diamonds, squares, and trapezoids are cut out and duly edged, he proceeds to plant them with masses of the things he most requires; but the stock things are Limes, Guavas, and such like fruits, and with flowers like Jasmine and Roses, of which a prodigious quantity are required for religious festivals and ceremonies. But there is a good deal of common sense in all this, for a garden so laid out is easily irrigated and kept in good order. He is not troubled about aesthetics, "breadth of effect," or "picturesque skylines." A garden to him is a place to grow things to eat, or use

in some way, and that is all that he wants. In the unregenerated gardens around the palaces, you see much that is absurd according to our canons of taste, but invariably there are fountains, often of beautiful design; but as a rule, out of all proportion as regards size to the extent of the garden. I think it was Bishop Heber who said that the natives of India built like giants, and finished their work like jewellers, and this is true of their buildings; but in the matter of gardens they seem to be like pigmies, incapable of originating any broad design, which alone can set off to the fullest advantage their wonderful buildings.

Gardening in India, as an art of culture, is such a wide subject that I will not attempt it here. The methods of cultivation and propagation, which, though primitive, are often highly ingenious, and altogether I have a good opinion of the native moles. He is skilful, and generally very painstaking, but it takes him some time to get into European ways of doing things. Mr. Woodrow, in his book, *Hints on Indian Gardening*, deals with the practical part of gardening in a very thorough way, which cannot fail to influence the future condition of gardening in India. *W. Goldring.*

HOME CORRESPONDENCE.

FRUIT PROSPECTS IN THE NORTH.—The fruit trees in the north of Yorkshire are sufficiently advanced to give one a pretty good idea what the crops will be this season. Altogether the promise is good, although in some places Plums and Pears in the open have suffered; in fact, those that were in bloom in the early part of April were nearly all destroyed. On April 1, we had 99° of frost; on the 2nd, 8°; and on the 3rd, 7°; twenty nights out of the thirty in April we had frost, consequently Pears and Plums on the standards were terribly injured. Apricots fared better; they were in bloom, and set in March, when the weather was moderately fine. Although cold, we were then without frost. Peaches here on a wall partially heated are good; these were set in March, and April frost did them no harm, as they were protected. The wonder is that Gooseberries and Currants are so good as they are, as they were in flower through all the frost in April; fortunately, the atmosphere was very dry, consequently they were saved; excepting the champagne Gooseberries, bush fruit, I think, will be good. Strawberries have a great promise everywhere in this neighbourhood. Apples promise a very abundant crop, although in many places whole bunches of bloom have fallen off without setting; in many instances, these can be well spared, as the trees when in bloom were perfect garlands, and very handsome. *William Culcraell, Thorpe Perrow.*

PÆONIES.—Your reflections on p. 736, how much any "well found" garden would lose in brightness, if there were no such things as Pæonies in the early days of June, is splendidly exemplified in a Reigate garden. In this garden there is a straight path of 100 yards or so; on one side is lawn, and the other a thick mass of foliage, in which pink Thorns and variegated Sycamores are very conspicuous. At the foot of the trees and shrubs is a border about 1½ yard wide planted with scarlet and pink Pæonies alternately, with yellow Calcæolarias and blue Violas in front of them. The glow of colour from the long line of gorgeous flowers is so brilliant, as to stay the attention of any passer-by on the road a considerable distance away. There is no flower in culti-

vation which is so effective in the distance as the Pæony. A pleasing feature in this border, when you come close to it, is the graceful foliage of the Solomon's Seal, numbers of which are growing behind the Pæonies, and afford them a beautiful setting. Ruskin, in his *Stables of Haystack Flowers*, has a drawing of his own of Myrtle Regina (to use his nomenclature), "sketched for her gesture only." Looking at the Norman arch of a flowering spray of the Polygonatum after a shower, when each leaf was glittering with bright globules of rain bright as diamonds, made one wish to be an amateur photographer, if happily one might catch there some of the loveliness of the picture to perpetuate it. *C. A. M. Carnichael.*

TREE PÆONIES.—These gorgeous early-flowering plants seed freely, and it is a wonder that we have hitherto had so few varieties in our gardens, but we now are being enriched by them at a rapid rate. They are very valuable as pot plants for conservatory decoration, but do not force readily, and do best when they are allowed to come gently into bloom. Outdoors they start a little too soon for our cold variable springs, and often get cut down in leaf, but they soon recover when warm weather sets in. To prevent injury as far as possible, they should be planted in sheltered spots, which the sun does not reach before noon. *J. S.*

PROFITABLE VINE-GROWING.—The Vines at this nursery consist of the true Black Hamburg, and the crops hitherto have been fair, the method of pruning followed being the spur; but I am now making experiments with the view of obtaining a much heavier crop. The appearances, so far, are very satisfactory. Instead of shortening last year's shoots to two eyes, two spurs with six eyes were left, and the growth made and the size of the bunches will lead me to adopt this method generally. There are twelve Vines in theinery, planted in an outside border at about 5 feet apart, and next season, instead of leaving two eyes to each spur on these Vines, every alternate spur will be left with six eyes, and at the end of the year these will be shortened back close to the main rod, the strongest being left to grow on for fruiting the next season; the other spur, shortened back to two eyes, will be allowed to remain with about six eyes the next season, the strongest shoot being selected to grow on for fruiting. The Vine border was trenched and heavily manured with cow-manure eighteen months ago, strong growths on the Vines being this season the result of this kind of treatment. To me it seems a waste of labour, and is the cause of light crops, to prune strong fruiting young wood so close, the forces of the Vines accumulating in these shoots during their growth affording materials for producing a heavy crop the ensuing season. The main rods will be kept, under my new method, wide enough apart to prevent overcrowding. *F. Cording, Effra Nursery, West Norwood.*

IBERIS CORIFOLIA.—Where summer arrangements have to be considered, this Iberis, which is at the present time in good bloom, should not be planted, it being a loss of beauty in the garden when it has to be removed to make way for bedding plants. In a rockery here—and this is its proper place, or the herbaceous border—this we have plants which are 1 feet across. It grows freely, and is easy to establish in a short time. Cuttings of the plant put into a cold frame in sandy soil about the end of the month of September, making them firm, and keeping the frame rather close, soon form a callus, complete rooting not taking place for a long time. The plants, if kept in the frame, will be in good condition for removal the following April. Neater and denser plants, and more of them, are obtained in this way than by division of the roots. *E. M.*

PELARGONIUM SEEDLINGS OUTDOORS.—I was surprised to find, when examining one of the beds here, in a very open situation, a quantity of seedling Pelargoniums. The bed was planted with Waltham Seedling last year, and there is no other bed within fifty yards of it. The seedlings which came up are Robert Fish, Crystal Palace Gem, and Black Douglas. The plants have just obtained their third pair of leaves, and are doing well. The bed had no protection in winter. *E. N., Fulham.*

CALCÆOLARIAS.—One of the finest strains in the country of this showy flower is to be seen at Wood-hatch, Mr. T. B. Haywood's garden. His gardener, Mr. Salter, who is quite an enthusiast in his culture, by careful selection of seed, has got together a collection which for brightness and variety of colour and

substance is as near perfection as possible. There seems to have been a tendency of late among Calceolaria growers to raise the darker-toned varieties; Mr. Salter has not aimed at this, for nearly half the flowers in the house are of lively and bright colours, which contrast well with the darker ones. It is interesting to notice the differences in the shape of the pockets in Calceolarias. There are so many variations as to make one wonder what could have been the original type from which they have been all evolved. *C. A. M. C.*

SOME STRAWBERRIES WHICH FORCE WELL.—Strawberries in houses are giving their last fruits, and perhaps a few remarks would not be out of place as to which varieties do well in this garden. We force but three or four varieties, and to get a really good Strawberry which suits the soil and locality, it is necessary for a gardener new to the district to find out by trial which one suits; for want of this test we often hear condemnation from one grower and praise from another. Take, for one instance, the Noble; I cannot speak well of its flavour, although it is a good cropper with me, and of large size. In the appended list I would say that the chief part are for home consumption, only a few being packed for travelling. To begin, the first that is put into heat is *Vicomtesse Hélicaric de Thury*, then follow on the others in the order in which they are placed: *La Grosse Sucrée*, *Eclipse*, *Pioneer*, *Laxton's Noble*—a variety which I am not going to force again. The best of these is *Eclipse*. It is the finest Strawberry that can be grown with a certainty of cropping, and with me none equals it in flavour. It is a variety that I would advise gardeners to grow. The Strawberries in my list are so well known that it is needless to say anything about them: *Keel* (June 17), *King*, *James Veitch*, President, *Sir Joseph Paxton*, *Sir Charles Napier*, British Queen, *James Veitch*, very large and of good flavour, and if a large Strawberry be required, it is the one to grow. *G. Howes, Merton.*

BLACK PRINCE STRAWBERRY.—Having read the several notes lately regarding early Strawberries, it may interest some of your readers to know how well *Black Prince* has been done at Addington Park for a long series of years without ever changing the stock. This season it is later than usual, but five-punneted berries were picked on June 10—good, full-sized, and well-coloured, and to-day (June 17), thirty to forty punnets could be gathered. On inquiry, I find the method of growing it has never been altered since 1851, and has been attended to by the same person, who carefully layers the strongest runners in pots as soon as runners are procurable, and when thoroughly established, plants them on a piece of well-prepared ground, 18 inches apart, the number being from 250 to 300; and never has there been a failure all these years. The crop this season is a very heavy one. Very often the first dish has been gathered on June 1. The soil is a light gravelly loam, and the subsoil is chalk. *A. B.*

THE EARLIEST STRAWBERRY.—I notice that you say *Crescent* seedling has proved to be the earliest at Chiswick this year. I have been gathering *Noble* since the 2nd inst., and considering they have realised 2s. to 3s. per lb., I consider it is the most profitable to grow. Last year, I was even earlier, gathering them in May. *A. D. Healey, North Walsham, Norfolk.*

ARAUCARIA IMBRICATA FRUITING IN THE NORTH OF ENGLAND.—At a meeting of the Bradford Naturalists' Society, held on Monday, June 2, Mr. E. Robinson described a short holiday he recently spent in the neighbourhood of Milnthorpe, Westmoreland. He had noted many choice plants on the Dalham Tower Estate, including a fine example of *Araucaria imbricata*, which was bearing fruit—eight cones for the first time—and of which the gardener was especially proud. So rarely does this tree fruit in Britain, that every instance of its fruiting is worth placing on record. *B.*

MEZEREUM BERRIES AND GREENFINCHES.—I was under the impression that *Mezereum* berries were poisonous, and up to three or four years since no creature touched them; but now each year, about the first week in June, or as soon as the kernel is formed (but not ripe enough to gather), the greenfinches come in shoals, and short work they make. The ravenous way in which they come is wonderful, and where they come from is a puzzle, for usually one or two pairs are all we see, but the fact remains that every seed is taken in about three days. This

season I had a row netted, but unfortunately the net, 1 inch mesh, was ineffectual, and the little wretches made their exit very quickly; however, one day I had them watched, and seventeen greenfinches paid the death penalty. But, notwithstanding this, I have lost every seed. Has anyone else had the same experience? *Charles Noble, Bingley, Shobroth.*

THE APPLE CROP.—A short time since, it seemed to be almost a certainty that there would be a good crop of Apples, bloom being abundant and apparently strong, but from some cause or other it has not set at all freely, or if so, the young fruits are fast falling, and it seems as if there would be but few left. Our Apple trees are tolerably free from maggot, which I attribute to liming, as I hear that the insect is very abundant in other places where, presumably, liming was not practised, and is doing much damage. Gardeners are mostly of opinion that a fine dry time is favourable for the setting of flowers, and the weather, while the latter were open, was remarkably bright and arid, but although the days were warm and sunny, the nights were chilly, and to the low temperature experienced must be placed the whole of the mischief. These repeated failures of Apples are very disheartening, and must have a discouraging effect on the advocates of a more extended culture of the fruit; but so uncertain is our climate, that we may get an entire change, and have a series of warm genial springs, such as we enjoyed many years ago, and then all will be well with the planters. *J. Sheppard, Woolverstone Park.*

FIG. 125.—SILMURDASH AT SHEEN LODGE. (SEE P. 764.)

LILIUM HARRISII.—A plant often met with at shows in London and elsewhere, is the above plant, which may be seen grandly grown in 6-inch pots, and carrying from ten to fourteen flowers. This variety of *L. longidormum* is a treasure to the gardener, and good for many decorative uses, it being amenable to pot culture. *J. Sheppard.*

SHIRLEY POPPIES.—The flowers of this type of field Poppy were gathered by me on May 21, from plants raised from seeds sown on a south border last October. The warm weather brought on the plants very fast, and plenty of flowers have been obtainable since that date. In no way do the cut blooms show to greater advantage than when placed by themselves in tall vases, with foliage of some kind. Cut when fully open, the flowers travel badly, and last only a short time; but when taken from the plants at various stages of bud development, and avoiding those which have not attained their proper size, and put at once into a vessel of water, the flowers last much longer. It is interesting to see the buds burst into flower in water; at first the petals are all crimped, and appear to be very small; gradually the crimping disappears, the petals develop, and remain wonderfully fresh for ten days. As decorative plants out-of-doors, Shirley Poppies are highly thought of by us. We grow them in bold patches and clumps in the herbaceous borders and other places, and among the Roses, where they make a show quite late in the autumn. These Poppies repay some labour being incurred in preparing the ground for them, which should be rich, and in supplying them with liquid-manure during dry weather. The worst thing that can happen to them is to crowd them in the seed-bed, the plants remain weak, and the flowers come small in size, and few in number. Six inches from plant to plant is the least space to allow, greater space is better still.

Some of our plants are 4 feet high and 2 feet through. I sow seeds early in February for succession, and again in the first week of April, thinning out the plants as soon as large enough to handle, and going over them again shortly afterwards. No stakes are needed by the plants. *E. M.*

VEITCH'S MODEL BROCCOLI.—Mr. Gilbert, in last week's *Gardeners' Chronicle*, takes exception to my note on the above, and is of opinion that at whatever date this useful Broccoli is sown in the spring, all the plants will come in together. I am of a different opinion, having for several years adopted the plan I advised, namely, of making two sowings, so that I am able to speak from certain knowledge. I usually sow a small quantity of seed early in March and again in the first week in May—that is a difference of two months—and from the plants raised in March we get nice heads at about the end of March and early in April the following year. This early sowing is pricked off as soon as large enough, and afterwards it is planted between the rows of the second early Peas, which are placed rather far apart to admit of three rows of Broccoli being planted when ready. From these plants we cut at the date above-named, and from the May sowing a month to six weeks later. This gives the succession I mentioned. Mr. Gilbert may ask, why sow a late Broccoli for cutting early in spring, when there are kinds that will not take so long a time on the ground? My answer is, that the *Model* is a variety that happens to be preferred to any other, being a pure white, and comes in with nice small heads; and, what is one of its greatest recommendations, the plant will stand a severe winter without injury, which other varieties will not always do; for when a large breadth of this valuable spring vegetable is destroyed, it is a loss not easily made good. The later sowing can be kept for some time by laying the plants in on a border facing north. These will produce only small heads, but in late districts it is found to be generally necessary to prolong the supply of Broccoli till the Cauliflowers come into use. We are now cutting Cauliflowers in abundance, and have only just finished the cutting of the *Model Broccoli* sown last year in May, not having been obliged to lift the late Broccoli to keep up the supply. *G. Wyles, Syon House.*

BRUGMANSIA SANGUINEA.—There is a fine plant of this in full flower in the conservatory of H. M. Bell, Esq., Undermount, Isle of Wight. It is more than 13 feet in height and diameter, and was, in the month of May, a sight well worth going many miles to see, there being over 300 fully-expanded flowers, and hundreds more coming on. Mr. Barlas, the gardener, told me that the plant had been in flower all the winter, but when I saw it, it was at its best. He cuts the shoots hard back every season, and early in August, and flowering commences in November, lasting till it is cut back. The double-white, sweet-scented *Brugmansia* is also there planted out close by; it is not such a fine plant as the other, although showing a quantity of flowers, whose perfume pervades the whole house. These species of *Brugmansia* are well worth growing when there is a sufficiently large house, and a border to plant them out. *A. H.* [*Brugmansias* do very well grown in tubs, and the plants may then be made use of in the flower garden, placing them in a warm and sheltered spot. They are subject to aphid, and difficult to keep clean when kept under glass in the warm weather. Ed.]

THE RECENT FROSTS.—Mr. Coomber records the injuries done to vegetation in Monmouth as being the product of a frost on May 30. Here, in Middlesex, the chief mischief was done on the morning of June 1, because the night had been intensely bright, clear, and quiet, although, perhaps, not much colder than was the night preceding, but then the wind was brisk, and there was little dew. It was not possible to regard the early portion of the night of May 31 with other than feelings of grave apprehension. In the low-lying places, where Potatoes, Runner Beans, &c., were especially exposed to the first rays of the sun, much mischief was done, that was fully apparent soon. With regard to Strawberry plants, then almost white with bloom, some few days had to elapse ere they told what harm had been done; now the black eyes in large quantities of the finest flowers are only too apparent. These have suffered most again where the soil is naturally moist, or the site a low one. One grower said that he found his bloom worst hit where previously mulched, as the fashion is with long manure. That, however, may have been a pure accident, and in no way connected with

mulching. Even where blooms have not been entirely destroyed, there can be no doubt but that the fruits will come somewhat distorted in many cases. All the same, there will, of course, be plenty of Strawberries, as all breadths have not suffered. The chief want seems to be a good ground rain of several hours' duration, and then the breadths might carry their crops to full maturity. A. D.

EPIPHYLLUM RUSSELLIANUM GAERTNERI.—This is a distinct and beautiful novelty; in habit closely resembling the typical *E. Russellianum*, but rather more compact. The flowers have a star-like form, with numerous, narrow, acutely-pointed petals of a peculiar bright red shade. It was to have been seen lately in full bloom in Messrs. R. P. Laird & Sons, West Coast Nursery, Edinburgh. Its value as a decorative market plant is being rapidly realised. B. S.

MIGNONETTE.—It would be very unpleasant were all soils so obnoxious to Mignonette seed-growth as ours is here, or as it usually is where it is stiff, cold, and clayey. When at Farnham Royal, where, in spite of the elevation, the soil in Mr. James' gardens is very clayey, I noticed that all the plants of the fine strain of Giant Red Pyramidal, which is grown there, had been turned out singly, and with ample room, because seed sown in the open ground either germinates badly or late. I have always experienced the same difficulty here, and am constrained to take so much trouble with even a common hardy annual, such as Mignonette is, to sow seed under glass, and dibble the plants out into the open ground. The soil this past spring has been exceptionally difficult for the planting of anything, but especially for small plants like Mignonette, which produce so few fibrous roots. After potting and repotting, shallow drills had to be drawn, water poured along them, the seedling plants dibbled out about 12 inches apart, and watered in, also watered several times later. For a week or two the plants look poorly enough. Presently, however, they break out, and soon after become very fine individual specimens. If the trouble be considerable, the growth later is ample. The three best forms of ordinary Mignonette are the Giant White, so fine for covering, and for making bunches of side-shoots; the Giant Pyramidal Red, so fine both outdoors and in pots; and Golden Queen, a beautiful yellow-flowered compact kind, well worthy of universal cultivation. A. D.

STRAWBERRY, AUGUSTE NICAISE.—This year I have grown this fine Strawberry indoors and out, and for the first time, and in future I intend to grow it more extensively. It is a free grower and a great cropper, producing fruit of immense size, fine colour, and good flavour. The finest crop of Strawberries of any variety I ever saw was at Wilton House Gardens, near Salisbury, a few years ago. The plants were growing in a wide border running parallel with one of the Peach walls, in rows 2 feet apart, and at about the same distance in the rows. The variety was Auguste Nicaise. However, for forcing purposes, size, and quality, and firmness of pulp, and the good condition they invariably reach their destination after a long railway journey, there are, in my opinion—and I have tried a good many varieties—none to beat President and Sir Joseph Paxton. In order to get the plants intended for forcing well-established in their fruiting pots, and with large, well-ripened crowns by the middle of the month of September, they should be layered now, or in a short time, into 6-inch pots. *H. W. Ward.* [For an account of the best method of layering, we would refer our readers to p. 741 in our last issue. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

TUESDAY, June 10.—Present: Mr. Morris in the chair; Mr. Pascoe, Prof. M. Ward, Mr. Blandford, Prof. Church, Dr. Müller, Mr. McLachlan, and Rev. G. Henslow (Hon. Sec.).

Delphinium, Injured Foliage of. Prof. M. Ward reported upon the specimens sent to the last meeting. The damage appeared to have occurred in the bud, and was probably due to the low temperature of the night of May 21. There was no fungus, and he had met with a similar case elsewhere. With regard to

the lowness of temperature, it was remarked by Prof. Church that at Twickenham 10 per cent. of Tomatos were destroyed on that night, Mr. Morris observing that the thermometer on the grass at Kew registered 27° F., or five degrees of frost.

Cremylos miles, L.—On a further examination of the caterpillars of boring beetles, brought to the last meeting by the Rev. G. Henslow from Malta, Mr. McLachlan noticed three specimens of the *Cerambyx*, and two of a *Lamellicorn*, or Stag-beetle, as well as one of the Wood-leopard moth, which had perforated the stem of a Cassia (though it was usually found in Pear trees) from Mr. Harry's garden at St. Julian's, Malta. Another remedy, in addition to that of "spearing," was suggested by Mr. Blandford, viz., to blow tobacco-smoke down the hole, when the beetle would attempt to escape, and could be easily caught. It is very important to observe where the beetles lay their eggs, and to catch them on the wing at the time. The name was wrongly reported in the account published in the *Gardeners' Chronicle* of the proceedings of the last meeting; and the name of the plant-bug should also have been inserted, *Lygus patulinus, L.*

Icerya Purchasi, Maskell.—Mr. Morris exhibited some mounted specimens, received from Mr. Lewis, of Ealing, of this so-called "cottony cushion" scale insect from Australia, prepared for the Kew Museum; they included adult females, with ovisacs, and the "Lady-bird," *Rodolia Icerye*, as well as remains of the *Teocrya* which had been destroyed by the *Rodolia*.

The Fog Report.—Mr. Morris called attention to the fact that the Royal Society had assigned £100 "on the recommendation of the Government Grant Committee, for an inquiry into the composition of London fog, with special regard to the constituents of fog injurious to plant life." An informal conversation followed with reference to chemical investigations to be undertaken at the laboratory of University College, under the superintendence of Dr. Oliver.

Cynometra coccinea.—Mr. Henslow exhibited specimens of this parasitic flowering plant from Malta. It was formerly supposed to grow only in "The Generals' Rock," a small island close to Gozo; but is now found at Mnaidra, on the south side of Malta, and in Sicily and Algiers. It is popularly known as *Fungus melitensis*, and formerly in great repute as a styptic remedy for hæmorrhage, &c. It is parasitic upon *Inula crithmoides*, a shrubby yellow-flowered Composite, which abounds on the rocks of Malta, giving the appearance of Furze bushes at a distance.

Leuon Seeds Germinating.—Mr. Henslow showed specimens of embryos which had begun to germinate while within the fruit.

SCOTTISH HORTICULTURAL ASSOCIATION.

This Association held its ordinary monthly meeting in 5, St. Andrew Square, Edinburgh, on the 3rd inst. Mr. James Greive, Vice-President, in the chair. Mr. James Holmes, Winton Castle, read a paper on "Natural Selection," which elicited an interesting discussion.

Exhibits were rather numerous. Mr. A. Grant, St. Leonard's Hill, Dunfermline, exhibited a fine specimen of *Cypripedium Stolon*, which was highly commended by the adjudication committee.

Mr. MacLattie, Newbattle Gardens, Dalkeith, exhibited an excellent decorative *Pelargonium* named *Newbattle*, a seedling raised by the exhibitor. The raiser has grown it for the last three years, and considers it one of the best for decorative purposes. It received the Certificate of the Association. It is a dwarf, compact grower, and an abundant bloomer. The same exhibitor set up cut blooms of fifteen species of *Masdevallias*; also a tiny plant of *M. tridactylites*, having thirty-four blooms, and a good plant of *Restrepia elegans*, also well bloomed.

A very handsome round white Potato in the way of *Village Blacksmith*, but obviously a large grower was tabled by Mr. John Downie, Beechhill Nursery, Edinburgh. It was named *Beechhill*. The Committee thought it distinct and promising, but desired to see samples of it in its proper season, those sent being out of season, although perfectly sound.

A branch of *Pavetta caifra* was exhibited by Messrs. Dicksons & Co., Waterloo Place, Edinburgh; and Mr. Morris, Hay Lodge, Trinity, exhibited an interesting collection of hybrid *Rhododendrons*.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending June 14, is furnished from the Meteorological Office:—

"The weather was dull, unsettled, and showery during the greater part of the period, with occasional thunder and lightning, but towards its close, the conditions showed considerable improvement.

"The temperature has been slightly above the mean in 'Ireland, S.,' and has just equalled it in 'Scotland, W.' and 'Ireland, N.;" in all other parts of the kingdom, however, it has been 1° or 2° below. The highest of the maxima which were generally recorded on the 10th varied from 60° in 'Scotland, N.' and the 'Channel Islands,' to 71° in the 'Midland Counties' and 75° in 'England, E.' Towards the end of the period, the daily maxima were very low for the time of year, especially in the North. The lowest of the minima were registered in most places on the 8th, when the thermometer fell as low as 29° in 'Scotland, N.' (at Lairg), 30° in 'Scotland, W.' (at Glenlee), and to between 33° and 36° in 'Ireland, E.' and most of the English districts; in 'Scotland, N.' the temperature did not fall below 44° in 'Ireland, S.' 47°, and in the 'Channel Islands,' 48°.

"The rainfall has been less than the mean in 'Scotland, N.' and 'Ireland, N.,' but in nearly all other districts there has been an excess.

"Bright sunshine has been very deficient generally, the percentage of the possible amount of duration having ranged from 12 to 23 in Scotland, from 14 to 35 over England, and from 32 to 33 in Ireland. In the 'Channel Islands' the percentage was 38."

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.	BRIGHT SUN.			
	Above 42° or below (—) the Mean for the week ending 3 inst. 1890.	ACCUMULATED.								
		Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 1, 1890.	Below 42° difference from Mean since Jan. 1, 1890.					
1	1	62	0	+ 155	— 72	2	112	21.6	23	27

12	1	99	0	+ 111	— 22	5	+ 101	15.1	38	41

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N. E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing S. Districts—7, Scotland, W.; 8, England, N. W.; 9, England, S. W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

MARKETS.

COVENT GARDEN, June 19.

OUTDOOR Strawberries are now arriving in large quantities, but not in well matured-condition, and prices have fallen considerably; Grapes are in excess of demand, and are only cleared at very low rates. Our market has been somewhat heavy this week. *James Webber, Wholesale Apple Market.*

FAUCI.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits including Apples, Grapes, Lemons, and Melons.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for various vegetables including Asparagus, Beans, Beetroot, Celery, Cucumbers, Endive, Herbs, Lettuce, and Mushrooms.

P. TATS.—The market since last report has hardened, and in many cases higher prices have been obtained.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots including Aralia, Arium, Aspidistra, Begonia, Cactus, Calceolaria, Cyperus, Dracena, Eucalyptus, Ferns, and Ficus.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various cut flowers including Abutilons, Bouvardias, Carnations, Chrysanthemums, Cornflower, Eucharis, Fuchsias, Gladioli, Heliotropes, Lilium, Maiden Hair Fern, Marguerites, Mimosa, Myosotis, Narcissus, and Orchid-bloom.

SEEDS.

LONDON: June 18.—Messrs. John Shaw & Sons, seed merchants of 37, Mark Lane, London, report to-day's market bare of business.

CORN.

Average.—Official statement of the average prices of British corn, imperial measure, for the week ending June 11:—Wheat, 25s. 8d.; Barley, 25s. 7d.; Oats, 20s.

FRUIT AND VEGETABLES.

SPIRALFIELDS: June 18.—Scarce supply of fruit; demand good; plentiful supply of fresh vegetables.

3s. per dozen bundles; Asparagus, 1s. to 1s. 9d. per bundle of 100 heads; Seakale, 1s. to 1s. 3d. per punnet; Cabbages, 2s. to 4s. 6d. per tall; Cauliflowers, 2s. to 1s. per dozen; Radishes, 3s. to 4s. 6d. per tall; Spinach, 4d. to 1s. per bushel; Peas, 2s. 6d. to 3s. 6d. do.; do., 5s. to 6s. 6d. per sack; Beetroot, 6d. to 1s. per dozen; frame Cucumbers, 2s. 6d. to 3s. 6d. do.; Greens, 1s. to 1s. 6d. per dozen bunches; new Carrots, 2s. 6d. to 4s. do.; spring Onions, 1s. 9d. to 3s. do.; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. 6d. to 2s. per dozen bundles; Horseradish, 1s. 1d. to 1s. 4d. per bundle; Endive, 1s. 6d. to 2s. per dozen; Cos Lettuce, 1s. to 1s. 3d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Egyptian Onions, 4s. 6d. to 5s. 6d. per case.

STAFFORD: June 18.—Cabbages, 1s. 6d. to 3s. 6d. per tall; Greens, 1s. to 1s. 6d. per dozen bunches; Mangels, 12s. to 18s. per ton; Onions, Egyptian, 5s. to 7s. 6d. per cwt.; Watercress, 7d. per dozen bunches; Tomatos, 2s. to 2s. 6d. per box; Gooseberries, 4s. 6d. to 5s. per sieve; Cucumbers, 2s. to 5s. per dozen; Lettuce, 1s. to 1s. 3d. per score; Carrots, 2s. to 4s. 6d. per bushel bunches; Peas, 3s. to 3s. 6d. per bushel; Cherries, 3s. 6d. to 5s. 6d. per basket; Strawberries, 5s. to 6s. per dozen punnets; Asparagus, 1s. 6d. to 1s. 9d. per bundle; Mint, 3s. per dozen bunches; Beetroot, 10d. to 1s. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: June 17.—Quotations.—Old Scotch Regents, 35s. to 45s.; Magnums, blackland, 35s. to 40s.; Lincoln, 45s. to 50s.; York, 55s. to 58s.; Kent and Essex, 50s. to 55s.; Scotch, 55s. to 110s.; Imperators, 40s. to 60s. per ton; New: Malta and Canary Islands, 45 to 48; Jersey, 47 to 48 10s.; Lisbon, 45 per ton.

SPITALFIELDS: June 18.—Quotations.—New: Lisbon rounds, 4s. to 4s. 6d.; St. Malo rounds, 5s. to 6d. do. kidneys, 6s. to 6s. 6d.; Cherbourg rounds, 5s. to 6s. do. do. kidneys, 5s. to 6s. 6d.; do. flukes, 6s. to 7s.; Jersey rounds, 5s. 6d. to 6s. 6d.; do. kidneys, 6s. to 6s. 6d.; do. flukes, 7s. to 7s. 6d. per cwt. Magnums, 35s. to 70s. per ton.

STAFFORD: June 18.—Quotations.—New: Jersey kidneys, 6s. 6d. to 7s.; do. flukes, 7s. to 8s.; Cherbourg rounds, 5s. 6d. to 6s.; do. flukes, 6s. to 6s. 6d. per cwt.

HAY.

Average.—The following are the averages of the prices obtained at the various m-trophtal markets during the past week: Clover, prime, 75s. to 92s.; inferior do., 45s. to 75s.; hay, best, 60s. to 87s.; inferior do., 25s. to 50s.; and straw, 20s. to 38s. per load.

NOTICES TO CORRESPONDENTS.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

BLIND NARCISSES: J. S. Do not know; wish we did.

BOOKS, TABLE DECORATION: E. T. Floral Decorations for Dining-rooms, by Annie Hassard, Macmillan & Co., London.—LANDSCAPE GARDENING: J. W. B. How to Lay Out a Garden, by W. Kemp, Published by Messrs. Bradbury, Agnew & Co. (Limited), Bouvier Street, Fleet Street, E.C.

PROCOLE: J. L. Excellent when cooked, and devoid of all strong flavour.

BAUGMANNIA: G. A. The leaves appear as if they have been syringed, and then a bright sun has shone on them, causing the watery globules to act like burning-glasses.

CORRECTION.—In our report of the Royal Botanic Society last week, Xerophyllum asphodeloides, shown by Mr. Howe, Merton Hall—one plant had six spikes and the other three, instead of two plants bearing three spikes, as reported.

GARDENER IN AMERICA: A. Y. Z. We cannot ad-

vised otherwise than to go there at once, get work in a nursery for a time, and look about you.

INDIA-RUBBER IMPORTS: Anacon. We do not possess the information. Apply at the Board of Trade office for the particulars you may require; or to the Queen's printer for a report on the subject.

INSECTS: G. Harris. The soil is swarming with all sorts of insects, weevil, grubs, and wireworm among them. Dress the soil heavily with gas-lime.

LILY: W. H. The Lily disease, due to a fungus similar to that producing the Potato disease. Burn the plants. See also p. 763.

LABOUR AND FUEL FOR FIVE ACRES OF GARDEN: FIFTEEN ACRES OF WOOD, PLANTED UNDERNEATH THE TREES WITH LATRELS KEPT LOW; TWO VINERIES, PEACH-HOUSE, SNOW-HOUSE, STOVE, ORANGERY, FIG, MELON, AND CUCUMBER-PITS, COLD-PITS: J. H. Houses, frames, and pits, two men and a boy; kitchen garden, one wall-tree man and two assistants, if much is required; if not, then one assistant would do; flower garden, one grass-mowing machine man, and one other man; two handy labourers for walk-weeding, for the plantation, and to assist with digging anywhere, and carrying coals to, and refuse from, the mansion, &c. Fuel for six months' forcing: 5 chaldrons of coke per month; orangery fuel, if separately burnt, say, 100 frosty days at 3 bushels of coke per day=81 chaldrons. If near gasworks, the cost of fuel for all the houses need not exceed £24 per annum—that is, if not more than two boilers are employed. It is impossible to fix the amount of assistance actually required; that can only be arrived at after a time, so much depending on the style in which the grounds are kept, the nature of the floral display, hardy flowering plants needing less attention than tender things. It materially lessens the labour if the water supply is a good one, and water is conducted by means of pipes all over the place. The nature of the soil, if heavy or light, must be taken account of, the former requiring more working, and consequently being more costly than light soil.

LATHRUS SIBTHORPE: C. W. D. There is no final "e" in Sibthorpi's name.

MELON LEAVES, &c.: P. We have now been able to see what is attacking your Melon leaves; white thrips were plentiful. The appearances of other leaves point to the same cause, or to red spider.

NAMES OF PLANTS: G. P. 1, Syringa emodi; 2, appears to be Cornus capitata (Benthama fragifera); 3, Philadelphus mexicanus; 4, Saxifraga pentactylis.—J. M. Chrysanthemum coronarium folium; Scilla peruviana.—H. J. H. Your specimen is insufficient to name from.—C. G. M. Asphodeline lutea.—B. T. Saxifraga trifurca.—W. A. P. 1, 2, 3, 1, Scilla nutans; 5, Papaver orientale; 6, Saxifraga decipiens.—James B. 1, Eupodium podagraria; 2, Libertia formosa; 3, Claytonia perfoliata.—E. R. 1, Silene alpestris; 2, Tamarix gallica; 3, Sisymbrium officinale; 4, Nepeta glehoma; 5, Charophyllum tenuum; 6, Euphorbia amygdaloides.—G. P. D. should address the Editor, not the Publisher. The tree is Fraxinus ornus.—J. B. Magnolia Soulangiana; Asrafrantia major.—B. T. Cardif. 1, Retinospora pisifera; 2, R. filifera; 3, R. dubia; 1, R. pisifera aurea; 5, R. squarrosa.—W. F. T. The labels were all detached, and the box smashed. We find remains of Orchis maculata, three forms; Lepidium Draba, n. 4; Polystichum Leuchitzi, a Fern; and Venus' Looking-glass (Campanula scapellato).—R. S. Asplenium Trichomanes.—Southampton should send better specimens. 1, Myosorus sp.; 2, Spiraea; 3, Pyrus salicifolia.—J. M. G. Heuchera sanguinea.—Nemo. 1, Ranunculus (2), a mass of pulp; 2, not recognised; 3, Lychis Flos Jovis; 4, Rhus cotinus; 5, Deutzia scabra; 6, Colutea arborescens: next time send better specimens, properly packed.—E. B. 1, probably Kalmia latifolia; 2 and 3, Rhododendron bursatum; 4, a form of R. ponticum; 5, a form of R. ferrugineum; 6, Kalmia; 7, Kalmia latifolia; 8, Rhododendron ferrugineum; 9, form of R. ferrugineum; 10, a seedling form of Rhododendron ferrugineum; 11, Coronilla Emerus: next time do not send more than six specimens. Some nurseryman, who makes a speciality of American plants, would be able to name the seedling Rhododendrons.—J. F. B. 1, Phyllocladus crenatus Mauve Queen; 2, Erysmium ochroleucum; 3, Limnanthes Douglasii.—F. A. E. B. A Thalictrum, probably T.

minus. A hardy perennial which will grow in any border without any special care.—*D. J.* Hydrangea stellata, fl.-pl.—*E. de J.* Buddleia globosa.—*H. M.* 1, Kalmia latifolia; 2, Weigela rosea; 3, Tormentilla erecta; 4, Syringa Josikava; 5, Crataegus Pyracantha; 6 and 7, not sent; 8, Zenobia speciosa.—*D. H.* should address such questions to the Editor, not to the Publisher. 1, Ferula, sp.; 2, Astrantia major; 3, Tradescantia virginica; 4, Magnolia purpurea. The Peach is not recognised, the fruit was imperfect.—*J. B.* No numbers—*Afrides* Fieldingii, the rose-coloured; *Afrides* odoratum, *Cattleya Mendellii*.—*G. R. Z.* Lycaste Deppell, *Mantella vexillaria*, both ordinary; *Iris graminea*.—*Tin bar*, no name. 1, Aspidia Lunata, so far as we can judge by the bad specimen sent; 2, *Doodia lunulata*; 3, *Adiantum formosum*; 4, *Blechnum cartilagineum*.—*Orchid*, *Cattleya labiata* var.—*G. W.* *Dendrobium Dalhousianum*.—*J. K. E.* 1, *Polypodium subarticulatum*; 2, *Lygodium scandens*; 3, *Adiantum formosum*; 4, *Davallia polyantha*; 5, *Aspidium quinqueangulare*; 6, *Nephrolepis pectinata*; 7, *Aspidium molle*; 8, *Lomaria gibba intermedia*; 9, *Adiantum Mariessii*.—*E. C.* Next week.—*Vesuvius*, *Onosma taurica*. Impure air probably causes the leaves of the Pelargoniums to turn yellow.—*F. F.* We cannot undertake to name varieties of *Coleus*.—*J. D.* 1, *Forsythia suspensa*; 2, *Sedum spurium*; 3, *Weigela rosea*; 4, *Vitis sp.*—*H. May*, 1, *Corydalis lutea*; 2, *Dendrobium suavisissimum*; 3, *Afrides japonicum*, a very fine specimen of it.—*A. B.* 1, *Cyrtanthus angustifolius*; 2, *Ophrys apifera*, *Bee Orchid*; 3, *Cephalanthera grandiflora*; 4, *Orchis conopsea*; 5, *Sainfoin*; 6, *Orchis conopsea*, the white form; 7, *Anchusa italica*.—*Campie*, *Dendrobium clavatum*, *D. transparans*, and *Aspidium molle*.—*Adioscens*, 1, *Iris Xiphium*; 2, 1, *ochroleuca*.—*R. T.* 1, *Polygala Dalhousiana*; 2, *Aristolochia*, next week; 3, *Cistus creticus*; 4, *Scopolodinium vulgare crispum*; 5, *Pteris hastata*; 6, *Anthemium lineare variegata*.—*E. P.* *D.* *Kerria japonica*.—*Yellow Orchid*, *Maxillaria aromatica*.

PEACH LEAVES: *W. F.* Have you been using too strong a dose of an insecticide? The address you want is St. Albans, Herts.

PEACH TREES: *H. W. D.* "Blister," arising from the presence of a fungus often figured in *Gardeners' Chronicle*. Pick off the leaves, and burn them.

POTATO AND POTATONS: *W. D.* The word is of hybrid foreign origin altogether, and hence is scarcely amenable to ordinary rules. When the question was first raised, we consulted an eminent philologist, the late Dr. Latham, who gave his sanction to the omission of the e, stating that the modern tendency was in that direction, and that we were simply in the advance guard, as the *Chronicle* always likes to be. We shall not alter our practice now. If you spell the word with an e in the singular, you must use it also in the plural. We conform more nearly to the Spanish original, and spell the word potato.

TOMATOS: *W. R.* We will closely examine the plants sent, and report next week.—*J. C.* It is very likely that some disease has attacked your plants—*Perozpora lycopersici*, or other. If that should prove to be the case the plants must be rooted out and the soil charred before re-commencing, indeed it would be a risky undertaking to plant Tomatos for a year to come.

TOMATO AND VEGETABLE GROWING FOR SALE: *J. W. E.* Before going into partnership, you would do better to go through a course of training in some good market establishment; and then, when you had acquired some knowledge of cultivation, you could go more safely into business, with or without a partner. Advertise in our columns.

TERREUSE: *H. R.* A fungus, trying stepping the bulbs in a solution of sulphate of copper, $\frac{1}{2}$ oz. to 1 gallon of water. Use it carefully. We may refer to it again.

WORDS: *S. R.* "And weed expels the flower."

COMMUNICATIONS RECEIVED—*C. Moore*, Swinley (best thanks).—*H. E. Vohy*—*Professor Goebel*, Marlburg—*Professor de Vries*, Amsterdam—*Lord R.*—*The Earl of A.*—*C. W. P.*—*J. D. S.* Boston, U.S.—*W. "The Demon" Insecticide and Cleanser

HIGHLY CONCENTRATED—MIXES INSTANTLY WITH WATER. For use in the Conservatory, Greenhouse, and Vinery; Flower and Kitchen Garden, the Hop-yard, and the Orchard.

Practically Tested by Practical Gardeners. Acknowledged to be the most Perfect Insecticide yet Invented.

From Mr. R. TURVEY, Head Gardener to Sir Richard Webster, Q.C., M.P., Waterford Gardens, Cranleigh, Surrey.—"Yours is the best Insecticide that has come under my notice; it not only destroys the 'pests,' but imparts a healthy look to the plants."
 From Mr. F. ASH, The Gardens, Government House, R.M. College, Yarktown, Surrey.—"I am pleased to say I found your Insecticide all I could desire after a good trial; safe for the most tender foliaged plants. I can confidently recommend it to anyone."
 From Mr. G. WILKERS, Nurseryman and Florist, Trumpington Road, Cambridge.—"We have green Demon Insecticide a fair trial, and believe it to be the best preparation for the destruction of insects, &c., infesting plant life. We shall continue to use it, and recommend it to our friends."

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 65° I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 72° kills the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually destroys Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through the common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d. (1, 2, and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO. Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

SLUGS.—Save your Garden Produce by using "Lous," 5s. per gallon, Diffuser included.

LIQUID MANURE ESSENCE, Inodoros, for Greenhouse and Garden, 5s. per gallon—will make from 50 to 100 gallons.

ARTIFICIAL MANURE, without Smell, will produce grand blossoms, unsurpassed for Fruit and Vegetables, 112 lb. cwt., 6 feet, 35s.

HORTICULTURAL BUILDERS.

BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Hothouses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hot-water Heating Apparatus of the country. Post-free on application.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus. Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of glasshouses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO FLORISTS, or FRUITERERS and FLORESTS.—Young Lady, thoroughly experienced, seeks re-employment; five years one situation. Age 21. First-class references.—EATES, Flower Shop, Tufi, Oxford.

HOLLOWAY'S PILLS.—Enfeebled Existence.—This medicine embraces every attribute required in a general and domestic remedy. It overturns the foundations of disease laid by defective food and impure air. In obstructed or congestions of the liver, lungs, bowels, or any other organs, these Pills are especially serviceable and eminently successful. They should be kept in readiness in every family, being a medicine of incomparable utility for young persons, especially those of feeble constitutions. They never cause pain, or irritate the most sensitive nerves or most tender bowels. Holloway's Pills are the best known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.
SPECIAL RAMS for HIGH FALLS to send up to Two Gallons out of every Five Gallons passing through them.

Fig. A.

This Ram raises a portion of the same water that works it.

This View represents Fig. A. Ram forcing up a part of the same water that works it, which is supplied from a spring. Special Rams of A make can be supplied to force to a height of 500 feet.

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From Mr. THOMAS VARLEY, Agent to the Trustees of the late William Roundell, Esq., Gladstone Estate, West Marston, Skipton, August 11, 1887.

"DEAR SIR.—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water trickled along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of two miles from, and at an elevation of 280 feet above the Ram. The water is then gravitated through several pipes and branches, having a total length of about four miles, for the supply of the mansion, gardens, stables, estate workshop, and steam boiler, the village of West Marston, and several farms. There are five fire-plugs inside the mansion, and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilize the water for other farms. I have much pleasure in being able to report as above."

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

"SIR.—In reply to your inquiry, the Hydraulic Ram you put down for me in 1881 has cost me only sixpence in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm, has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down a two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you warranted. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water supply is the greatest possible comfort to me."

"Yours faithfully,"

"C. PAGE WOOD."

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

"DEAR SIR.—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry-weather flow being 6 pints per minute, with which quantity you promised to work the Ram, forcing through 224 yards of delivery pipe to an elevation of fully 144 feet, but out of 5½ pints per minute, 166 gallons per day are sent up; and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,—I am, dear Sir, yours faithfully,"

"MATTHIAS SMITH."

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

"DEAR SIR.—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of De-lay Village. 40,000 gallons per day was the quantity you promised they would force to a height of 48 feet. On testing them I am convinced that 20,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6 inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marlon Hall, Middlesbrough, September 26, 1883.

"DEAR SIR.—I am glad to say that the Rams you put down on the Hambleton Estate for Mr. C. F. H. Bolckow are working very well. You undertook, with 16 gallons per minute, to send up 1,000 gallons a day, and with enough water to work the Rams at full power, 2,000 gallons a day. With a supply of 1½ gallons per minute they are lifting 2,200 gallons, and when working full power 3,000 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since." (The delivery pipe in the above case is 1000 feet in length.)

From CAPTAIN TOWNSEND, Wincham, February 10, 1877.

"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, HYDRAULIC ENGINEER, ACCRINGTON, LANCASHIRE.

"Irradiating the Present—Restoring the Past."
HARTLAND'S PATENT PHOTOGRAPHS.
New Series Edition.

Illustrated by GERTRUDE HARTLAND.
This publication is limited to 1000 copies. It is purely a Drawing-room Book, and work of art among garden owners, exclusive of trade afterthought. A key for use, descriptive and proof, can be had in July. More than probable, in 100 years, this edition, from the artistic point, will be scarce and valuable as a quantity of the "Blossoms of the Past" of this age, and particularly as it emanates from such a small place as Cork.
WM. BAYLOR HARTLAND, F.R.H.S., Seed-man and Florist, 24, Patrick Street, Cork.
TRADE CIRCULAR of Best Market Sorts, Post-free.

TURNIP SEED FOR SALE. White Globe Turnip Seed, 1890 Growth, for Sale cheap, in large or small quantities. Apply to Mr. E. P. NEWMAN, Harze, Pole Hill, and Hayes End Farms, Hayes, Middlesex.

BOROUGH OF SUNDERLAND. TO ARCHITECTS. THE CORPORATION invite DESIGNS for the ERECTION of PERMANENT BUILDINGS upon the Lower Promenade at Boker, to be used as Cafes, Rest-houses, &c. No premiums are offered, but the successful competitor is to be entrusted with the carrying out of the work, subject to the sanction of the Corporation. A Copy of which, with Lithograph Plan of the site, may be had on application to the Borough Surveyor, East Cross Street, Sunderland. Designs to be delivered on or before second day of August next. By order, F. H. S. BOWEY, Town Clerk. June 26, 1890.

ALFRED BROOKES.—Pursuant to an Order of the Chancery Division of the High Court of Justice made on the 15th day of July, 1889, in Part 15, Case 12, Part 15, Brookes (1889 G 242), **ALFRED BROOKES**, formerly of Bromborough, in the County of Gloucester, son of James and Ann Brookes, of the same place, by his Solicitor, on or before the 10th day of July, 1890, to come in at the Chambers of Mr. Justice Stirling, at the Royal Courts of Justice, London, and PROVE his CLAIM to a SHARE of the RESIDUARY ESTATE of the said THOMAS BROOKES, or in default thereof, he will accordingly exclude from the benefit of the said Order. The said Alfred Brookes was a gardener in the employ of Mr. Brooke Hunt, of Boughdon Hall, near Gloucester, and subsequently employed at the Nurseries of Messrs. H. S. Williams & Co., Finsbury, Upper Holloway, in the County of Middlesex, and is stated to have afterwards entered the employ of the Roskerville Public Gardens Company, Roskerville, in the County of Kent, and then, on the 14th day of July, 1890, at 12 o'clock, noon, at the said Chambers, appeared for hearing and adjudication upon the said claim. Dated the 6th day of June, 1890. H. F. CHURCH, Chief Clerk. **ALFRED B. BINYON and CLARKE**, 11, Colindale Avenue, London, W.C.

DAILY PARCELS EXPRESS SERVICE TO THE CONTINENT, and Queenborough, Fishing, Kaldenkirchen. L'HORTICULTURE INTERNATIONALE
(Linden), Brussels, Belgium.

NEW ORCHID, ANNOUNCED FOR THE FIRST TIME, CATTLEYA WAROCQUEANA (LINDLEY).

See R. A. ROLFE'S description in *Gardeners' Chronicle*,
June 14, page 735.

The discoverer of this *Cattleya*, M. BUS-EROTH, of Cateau-
tium fame, one of the collectors of the Company, writes about
this grand introduction—

"This is a most beautiful *Cattleya*. Never during my travels
in Colombia or Venezuela have I seen *Cattleya Mendocino*,
Triane, or Mossie, to be compared with it. The flowers are of
enormous size and exquisitely rich colour. I have seen a
number of plants in bloom; one seemed still more beautiful
than others. I am assured that there are also some pure white
forms among them. This species is very free flowering, bearing
from five to six flowers on a scape."

The plants arrived in Europe on April 18 last, in splendid
condition, with healthy dormant eyes, and well leaved. On
arrival, several plants were found in bud; on the opening of
the flowers, they fully verified the statement above.

This *Cattleya* is of very robust habit, with large thick
leathery leaves. In culture this species seems especially easy;
since their arrival, the plants have without special care or
treatment produced an abundance of roots.

We recommend orchid lovers the acquisition of this grand
Cattleya; the plants offered are all outwreath. We are certain
that some magnificent varieties will turn up among them.

We have spent a large sum of money in the researches of
this magnificent *Cattleya*, and offer the same at the lowest
possible terms.

We offer good semi-established plants in excellent condition,
rooting freely, at the following low terms, cash—

One good plant	41	1	0
Three good plants	2	17	6
Six good plants	5	5	0
Twelve good plants	8	17	6
One strong plant, 6 to 8 bulbs	1	12	6
Three strong plants, 6 to 8 bulbs	4	12	6
Six strong plants, 6 to 8 bulbs	8	4	0
Twelve strong plants, 6 to 8 bulbs	11	11	0
One extra large specimen	1	4	0
Three extra large specimens	11	11	0
Six extra large specimens	20	12	6

Carrage Free to any part of the United Kingdom.

DROPMORE.

HOW beautiful this year have been the
Azaleas and the Rhododendrons which
Philip Frost planted years ago, and prattled so
prospitally about long after. A cursory look through
this fine dromes reveals only, as it were, the
superficial beauties of the shrubs and trees.
One must explore the grass rides and gravel
walks in all directions to see all, if it be possible,
where there is so much. Although a vast
pleasur garden in one sense, yet Dropmore is
far more truly a wood or common, with all the
natural charms remaining, yet beautified by the
art of the gardener, so that it presents at any
time, but especially in the Rhododendron season,
a sort of terrestrial paradise, so free it is from
all external cares or worries; so natural, and
yet so abundant, are its beauties. There the
Rhododendrons and Azaleas do not seem as if
they ever were planted. It would rather look
as if seeds or plants had dropped naturally, and
had been left to grow without reference to man
or to art whatever. In places, from the fore-
ground the big masses of bloom of numerous
lovely shades ascend in receding heights and
volumes until a huge and lofty bank is formed,
of such exceeding loveliness as to defy word
picturing. If there are few of those intensely
glaring reds and crimson in the Rhododendrons,
found in the named hybrids, there is a wealth of
soft shades. In one spot, planted without knowl-
edge, several shades of purplish-lilac ascended
from pale to deeper, with the utmost regularity,
and yet when planted, probably, the shrubs
had never bloomed; but with Azaleas and Rhododendrons,
fine plants, presenting wonderful
masses of bloom, fall in as objects of special
interest at the end of vistas, or present
special beauties not otherwise noticeable. It
seems as if the planter had thought of the
ultimate effect, and yet had put in his shrubs

ROSES** in the most lovely kinds, 1s. 6d. and 2s. 6d. each.

CLIBRAN'S, Oldfield Nurseries, ALTRINCHAM.

promiscuously without consideration, only planting where space was available. The Azaleas certainly excel the Rhododendrons in the wondrous profusion of shades of colour found in them, which have such softness, and yet warmth. Bushes here and there literally clothed in golden-brown, or in pink, or peach, or apricot, or some of those lovely tints which would make the modern costumier writhe with envy, meet the eye on every hand. Some of the plants have in their semi-uncultivated condition become almost stunted, but they bloom all the same in wonderful profusion. They like the natural soil of Dropmore, which enables all the tribe to grow like weeds, just as it enables all the Coniferae family to thrive, too, so that the specimens there have secured world-wide reputation. How far old Frost may have planted of his own initiative, or how far he mechanically obeyed the instructions of his employers, we may never know fully. The old man in his later years had become so garrulous, that his praise was too often more of himself than of others; all the same, whether planted at his own option, or by the orders of others, Dropmore must for many years remain a lovely monument of the old gardener's untiring energy and zeal, for everywhere there are reminders of the fact in tree and shrub that Frost planted here.

It is well that the management of these gardens has fallen into the hands of Mr. Herrin, who so thoroughly enters into the spirit which thus animated his old predecessor. There is no anxiety to make improvements which are not in accord with the general surroundings, but Mr. Herrin is adding here and there more bits of colour, opening out the handsomer groups and splendid trees as they develop; planting as opportunity offers, to maintain the reputation of Dropmore for beautiful trees to a remote date; and generally doing the very best that can be done in gardening with comparatively ancient surroundings. Such is the gardening policy at Dropmore to-day, and it is the best for the place. If the snowstorm of a few winters back robbed the grand old Douglas Fir of its former fine proportions, it is still a remarkable tree; whilst the Giant Araucaria, its upper part full of small cones, is as grand a specimen as ever.

In some parts of the ground there are specimen Conifers, which, if not for dimensions, at least for elegance and beauty, especially as seen with the spring growth upon them, that could hardly be excelled; what a remarkable group would the various examples of *Tsuga Albertii*, *Abies grandis*, *Cedrus atlantica*, *Picea Smithiana*, *Cupressus Nordmanniana*, and *Abies pinsapo*, make, were they all brought together. As it is, however, each of these, with many others, come as revelations of beauty and form in diverse places, and with unexpected pleasure.

Frost's fine old *Fuchsias*, of which he was so proud, are still carefully preserved and planted out in a spot amidst lofty, overhanging trees, held almost sacred to these flowers. They have been severely headed back with good results; indeed, it is almost remarkable to find how the old gnarled *Fuchsia* stems, many years old, have responded to the severe handling, and have broken with greater strength than ever. Here, secure from strong winds with cool, shady surroundings, *Fuchsias* thrive luxuriantly, and long may they continue to form a pleasing feature in what still remains one of the most beautiful, and yet most natural, of gardens.

There are immense quantities of the lovely blue Iris Florentina at Dropmore, and these were the other day singularly effective. Probably in most other gardens they would have been cleared out to make room for other things, but here old friends are carefully nurtured. Somehow the abundance of hardy garden plants here always seems to give something in bloom, whilst tender bedding or foliage plants are not overlooked for the production of brilliant displays of

colour during the season that Dropmore is visited by the owning family. A very odd method of dealing with some late ripening bulbs was seen in the case of beds of Jonquils. In order that the soil might be prepared for summer bedding-plants, the bulbs had after blooming been lifted, the weaker ones pricked out; then the clusters of the finest roots were kept in place by tying the "grass" into knots, and being replanted would be found strongly rooted, and making rapid growth, when the tender bedders are pulled off in the autumn. There is in one of the more recently-erected span-houses, a Tomato, the product of a cross between Ham Green Favourite and Perfection, which bids fair to be one of the most prolific seen. The flower racemes seem to excel the leafage in profusion. It is a wonderful setter, and the fruits are as large as those of Perfection. Near by, that beautiful green-fleshed Melon, La Favourite, raised by Mr. Herrin, at Chalfont Park, is fruiting admirably. It is one of the best flavoured of the green section. *A. D.*

IMPNEY HALL.

IMPNEY is the residence of John Corbett, Esq., M.P., for Droitwich. In the gardens very extensive work, of much horticultural interest are being carried out, and a few notes which I took on the occasion of a recent visit made to the place, may afford some useful hints to readers of the *Gardeners' Chronicle*.

The mansion, in the French style, is situated on an eminence overlooking the River Salwarpe, which, hereabouts, has been widened out so as to form large lakes and waterfalls, the work being done in the most natural manner. A second terrace, with wings on the east and west sides, and of an area of 7 acres, extends right down to a lake. This is an addition to the existing terrace, and is approached from them by two fine flights of steps, which are thrown well forward so as to break up the too severe lines of the balustrade; the plans were furnished by Mr. W. Goldring. The shape of the new extension is that of an easy semicircle, divided into a central panel and two side panels—the central panel having an elaborate fountain and basin, towards which large beds converge, formal partly in outline and planted with hardy, flowering, and other shrubs of an ornamental character, viz., white and yellow variegated Hollies, *Berberis Darwinii*, *Osmanthus ilicifolius*, *Skimmia japonica* (oblata), *Veronica Traversii*, *Elaeagnus aureo marginata*, *Cupressus Lawsoniana* lutea, *Ketinosporas*, *Vincas*, &c., with a few standard specimens of good varieties of Rhododendrons, *Cedrus atlantica*, and *C. deodara*, Golden Queen and Silver Hollies, Golden Yews, *Cupressus Lawsoniana erecta viridis*, &c. The terraces at the ends, or wings as I prefer to call them, are planted with many hundreds of the choicest Rhododendrons, and specimens of the same, 7 feet in height, are dotted about. The whole of this part of the design is surrounded by posts 3 feet high, standing at 9 feet apart, with a chain passing from one to the other, which is covered with Ivy, Clematis, &c., to form festoons. Outside these terraces, and sloping right down to the water's edge, the planting is in a free style, and serpentine walks lead to points where some pleasing object or an enjoyable vista are visible. The Malvern Hills form the sky line on the spectator's left, and the Abberley and Shropshire hills on the right hand. Some effective shrub beds in this part consist of *Prunus Pissardi* planted 3 to 4 feet apart. These beds are edged with three rows of *Acer negundo* variegata. Specimens of standard Rhododendrons, *Cedars*, *Piceas*, *Hollies*, and *Yews* being introduced with good effect. The lake banks are made irregular with masses of rock, and are planted with Alpines and Bog plants, and form a very pleasing and artistic whole, and exhibit the fine taste possessed by Mr. Corbett, and the skill and knowledge of his gardener, Mr. Parker. In a dell near the mansion and surrounded by trees, a fernery, an octagon in shape, 120 feet by 60 feet, and 50 feet high, was being erected. It will be filled chiefly with plants of *Dicksonia*, *Alsophila*, and *Cyathea*,

in very large specimens. Rockwork on which smaller-growing species will eventually be planted, and dripping caves for *Trichomanes* and *Todeas* are also being constructed, and all is to be heated by means of hot water.

In the forcing houses, excellent crops of Grapes, Peaches, Netartines, Pines, Melons, and Figs were observed. Flowering plants are well, but not extensively grown under glass; a few Orchids are amongst them. *Chrysanthemums* are grown to the number of 600. The flower garden receives great attention, carpet bedding especially. Fruit trees on walls, as pyramids, Roses, herbaceous plants, Strawberries, and vegetables, all show skilful management. These beautiful grounds with their undulating surface, the lovely surrounding landscape, flourishing crops, and the neat appearance of everything, form a most pleasing picture of a wealthy gentleman's residence. *W. Crump, Madresfield Court.*

THE BULB GARDEN.

GLADIOLUS COLVILLEI ALBA.

THE soil best suited for this useful and pretty species is a friable loam, well decayed, with the addition of a slight sprinkling of pulverised manure or some kind of mild fertiliser. The size of the pots employed is of some importance. Some growers recommend small pots, but I have always had the best results from pots 9 to 10 inches in diameter; the pots of this size, when planted rather thickly with the *Gladiolus corvus*, present a much better effect than smaller pots, the height and width of the mass bearing a better proportion to each other.

After flowering, the plant should be well supplied with water until such time as the leaves ripen, when water should be entirely withheld, and the pots laid on their sides in a sunny position out-of-doors; there they should remain until the end of the month of August, when re-potting is usually performed, and at that time no fresh roots should be made.

After potting, if the fresh soil was sufficiently moist, it should not be watered for some time afterwards. A good plan then is to plunge the pots in coal-ashes, there to remain until the autumn is well advanced, and the young growth begins to peep through the soil, when, if there is much plunging material over them, it should be removed. Frequently it happens that the winter is well advanced before growth appears, but all that is actually necessary is protection from frost after growth is made; and much forcing is not desirable, as it robs the flowers of substance, but plenty of sunshine. Plants may be raised from seed, which, if well managed, will flower the second year, but they do not always come true. *F. B.*

LESCHENAUTIAS.

THIS beautiful old plant was shown in quantity at the recent show of the Royal Horticultural Society at the Temple gardens. The plants which were shown by Messrs. Balchin, Hassoock's Gate, were small, but their flowers, of a lovely blue colour, were very universally admired, and at times quite a crowd gathered around the group. It is a plant worthy of extended cultivation, and at one time it was quite common to see some of it in most collections of greenhouse plants; but of late years it has been neglected. It is not a plant that is easily grown, and on that account it is the more likely to get neglected by gardeners; but amongst growers of plants the difficulty should disappear. Many other plants were at one time fought shy of, which are now grown in quantity. I believe its greatest drawback is its liability to damp-off and contract mildew, but Messrs. Balchin seem to find little difficulty in this respect; and they would doubtless have experienced some greater difficulty had the plants been large. I have observed that when the plants are grown near the light in a well-ventilated house, there is less danger of damp mouldy tops than

in a close, ill-ventilated house. There is no more telling plant in a collection of greenhouse plants than this old favourite. It is amenable to the same kind of treatment as that afforded soft-wooded Heaths, employing good fibrous peat, coarse silver-sand, and ample drainage in the pots, and, after blooming, a light sunny position under glass to thoroughly ripen the wood. When repotting is performed, great care is necessary with the waterpot, which points to the evils that will follow overpotting, the plants soon dying off if too much water be used. I do not advise the removal outside of these plants till the new growth is complete.

I believe that many plants are lost by their being placed in unsuitable places before growth is finished, thus becoming a prey to mildew. If possible, only rain-water should be used. Repotting should be done as soon as flowering is past, and the plants kept rather close for a time, a sharp watch being kept for mildew. Cuttings of the new growth when about half matured strike under a bell in a warm greenhouse, using very sandy peat, and placing them round the sides of a 60-pot. *L. biloba* major and *L. formosa* are the best two kinds for greenhouse decoration. *G. Wythes*, *Sym House*.

FOREIGN CORRESPONDENCE.

MEXICAN AND COLUMBIAN ORCHIDS.

IN the number of your esteemed journal for March 22, which has just come to hand, I see a note of M. L. Linden about Mexican and Columbian Orchids, to which allow me to make a few observations, which may interest some of your readers.

The reason why Mexican Orchids are of easier introduction than Columbian, I think is partly a much quicker transit in Mexico by railroads, &c., and also that according to collector friends, a great many of the Mexican Orchids grow more exposed to the sun, and therefore are more hardy and better capable of resisting hardships in transit. On the other hand, the Columbian Orchids are a much longer time on the way to the coast, eight to ten days on mule back, and seven to ten days by river steamer. During the first part of the journey, they are exposed to all the inclemencies of the weather, rain or scorching heat, according to the season. At the same time most of these Orchids grow in situations more or less shaded, and in a humid atmosphere, as *Odontoglossum Pescatorei*, *O. triumphans*, *O. tripudians*, *O. crispum*, *O. luteo-purpureum*, *O. vexillarium*, and others, much more so *Odontoglossum blandum*. The exemptions are *Cattleyas*, *Odontoglossums*, *Phalænopsis*, *Hastilabiums*, &c. In addition, I may mention that I have never succeeded in the culture of Mexican Orchids here, viz., with *Lælia albidula*, *Ancopsis*, *autumnalis*, *Odontoglossum citrosum*, *Inslayi*, *Rossii*, etc.; nor with *Cattleya Trianae* and *C. Schroderii* in the stove, nor with the *Odontoglossums crispum* and *luteo-purpureum*, *Pilumna nobilis* out in the open air. The latter three species grow with me luxuriantly under very little shading, close to groups of *Roses*, *Fuchsias*, *Ericas*, and such like. *G. Kalmeyer*, *La Flora Bogota*, May 18, 1890.

VEGETABLES.

LETTUCES ON NORTH BORDER.

IF a border on the north side of a wall or fence is available, good plantings of both Cos and Cabbage Lettuces may be made at this season, the heads being crisper and solidier than from sunny quarters of the garden. In July and August the temperature of the soil of such border, and the amount of moisture contained in it, are more uniform than elsewhere, and the plants grow without check, and attain a large size, with little tendency to run to seed, so frequently the case with plants grown in the fall sun. *H. W. W.*

TOMATO CULTURE.

The chief points in successful Tomato culture, either in or out-of-doors, are keeping the shoots and leaves well thinned out, and shortened back, and the leading ones securely fastened to the wall, or to sticks. During hot weather, copious supplies of water should be afforded the roots, especially in narrow, confined borders, and a mulching of short dung should be laid on the soil over roots, to keep them uniformly moist during hot weather, and increase the weight of the crop of fruit. *H. W. Ward*.

EARLY NANTES HOEN CARROT.

Young Carrots being very much in demand by the cook, a good sowing should be made forthwith on a warm, if not a southerly border; and if the soil be light, it would be rather an advantage. The seed drills should be about 1 inch deep and 1 foot apart, and the soil should be returned to the drills with the feet after sowing the seeds, after treading the ground all over and raking it smooth. In order to check injury to the roots by wireworms or grubs, a little fresh soot should be strewn over the ground before the drills are drawn. *H. W. W.*

ROSETTE COLEWORT.

I like to sow a bed of the Rosette Colewort at the present time to raise plants for late autumn and early winter supply. When the plants are large enough, set them out in rows at 15 inches apart each way. *H. W. W.*

ROCK PLANTS ON WALLS.

The late M. EDMOND BOISSIER, in his excellent botanic garden of Valleyres, near Rances, in the Canton de Vaud, conceived a method of cultivating rock plants which has always taken my fancy, and which I have endeavoured to reproduce elsewhere. Imagine a large supporting wall bearing a terrace, the sides of which are completely covered by exotic plants, and which, during the greater part of the year, afford a veritable carpet of variously coloured flowers. Imagine buttresses of the walls open to the north and the west, protecting all the treasures of the east, of the Spanish Sierras, of the Pyrenees, and of the Caucasus. Then conceive the constructions formed on this by loose blocks of tufa, forming, as it were, an elongated pyramid. All this is specially intended for the rock-loving flora—the most interesting and beautiful of all. These plants were among those most loved by the great botanist, and one cannot but confess, justly so.

My friend, Mr. G. F. Wilson, one day told me that he experienced great difficulties in the cultivation of rock plants at Oakwood, because of the absence of stones in that part of Surrey. This is much to be regretted, because of the floral beauty of which people who are so situated are deprived, but can they not introduce rockeries of artificial stone, not cemented together, but placed one over the other?

Such a structure offers the great advantage of allowing the development of a large number of plants on the same surface at but little cost, and, what is a great consideration, especially in England, where the climate is too damp for rock plants, the avoidance of rot, and the dangers of too much moisture. One cannot form an idea of the number of pretty and interesting species which prosper under these conditions, and in an absolutely vertical position. These walls of M. Boissier contain a superb collection of plants, and I must say that some are even as well acclimatised at Valleyres as they are on the walls and rocks of the neighbourhood.

The natural rocks are many of them porous, and act the part of a sponge, becoming saturated with moisture during the period of heavy rains, and giving it up again to the air, as that becomes dry; limestone rock is more porous than granite, and it is for that reason preferable in many cases (excepting, of course, for purely granite-loving species). Rock plants are, much more than others,

dependent on cool conditions and moisture by which they are surrounded. The roots of this class of plants are always more developed than those of other terrestrial plants, and are more deeply buried among the rocks, and the deepest fissures are constantly moist along their sides. This water is communicated to the roots, and it also escapes as vapour from the outer face of the chink, where the leaves are placed. That is why we find so large a number of Ferns among rock plants, although those plants are known to seek above all things a cool and moist air; but this moisture must not be stagnant, and it must also be balanced—constant, but not too much. That is why the wall and the vertical rock are such advantageous situations for a large number of alpine plants.

In the open air, and in the hottest countries, rock plants and even some others may be grown on walls. One of my friends, to whom I had shown M. Boissier's system, has established at Clarens, on a wall exposed to the full sun, alpine plants of great beauty. *Linaria alpina*, *Antirrhinum azarina*, *Campanula Vanneri* flower freely in this position in the full sun, and alternate in a manner more peculiar than pretty, with the flowers, leaves, and fruits of Peaches which clothe the wall. On a large wall of tufa, over 200 metres in length, Mr. Isaac Demole, of Veytaux, on the borders of Lake Geneva, has introduced the most charming and the rarest of alpine and rock plants. There they flower and grow in an astonishing manner. The various *Corydalis* (lutea, ochroleuca, and rosea) mingle their flowers with those of the *Silenes*, *Dianthus*, *Opuntias*, *Helianthemums*, *Iberis*, *Arabis*, *Sedums*, *Sempervivums*, *Saxifrages*, *Campanulas*, &c., and each multiplies and grows on in so vigorous a fashion that the wall will soon be covered by them.

With M. Boissier the wall has long ago disappeared beneath the verdure of the plants. In this vertical position, *Saxifraga longifolia* becomes enormous, and attains a size which it never reaches in Nature; *Campanula Vanneri*, *C. Garganica*, *C. Portenschlagiana*, and others besides grow grandly, and interlace their flowers with those of *Mathiola Valisiana*, *Phyteuma comosum*, *Silene Elizabethæ*, the *Tyrolean Primulas*, *Androsaces*, and *Saxifrages*. These walls at Valleyres are among the most beautiful objects I have ever seen, and I feel that all who are able will follow the example of M. Boissier. Old walls, even if they have no particle of soil between their stones, are most suitable for plants, as the roots insert themselves into the smallest chinks, and find in the stones themselves, which they dissolve and disorganise, all the elements necessary for the development of the plant. The perpendicular position suits certain species which do not bear stagnant water or moisture around the tuft, and of which I shall speak another time. *H. Correvon*, *Director of the Alpine Garden, Geneva*.

EPHEDRA ALTISSIMA.

GENERALLY speaking, the species of *Ephedra* are relegated to the botanist's pure and, less or more, simple. To him they are of very great interest, as a link between the Conifers, and through them with the *Lycopods*. Their near alliance to the extraordinary *Welwitschia* also gives them additional interest. To the lover of rock plants they present themselves as curiosities, not unlike the Horse-tails (*Equisetum*), but it is rare, indeed, in this country that they present themselves in any more attractive guise. Thanks, however, to Mr. Hanbury, of La Mortola, we are enabled to give an illustration of the plant in fruit. The brilliant scarlet pulpy berries (we hope the botanist will forgive the popular term) are singularly attractive, so much so, that we may hope, now that attention is called to them, that we may succeed in this country, at least under glass, in producing them; certainly we have rarely experienced a greater "sensation" than that which occurred when Mr. Hanbury's box was opened. The genus comprises about forty species, which lately have been carefully monographed by Dr. Stapf.

NEW OR NOTEWORTHY PLANTS.

DENDROCALAMUS SIKKIMENSIS.*

For the opportunity of figuring this fine Bamboo (fig. 130, p. 783) we are indebted to the Earl of Annesley, by whom it was sent for naming. It was, we believe, collected by his lordship in Sikkim, where, according to Mr. Gamble, it is known to the Lepchas under the name of Pugriang, and where it grows at elevations of from 4000 to 6000 feet, and is the tallest Bamboo of that country, which is tantamount to saying that it is a giant. Mr. C. B. Clarke, F.R.S., to whom we are indebted for the identification, and who knew the plant in Sikkim, adds that it may possibly be hardy in Ireland or the South-west of England. The general appearance of the foliage is sufficiently shown in our illustration, which is reduced one-fourth. The flower-heads are in globular masses, $1\frac{1}{2}$ inch across.

Mr. T. Ryan, the gardener at the Earl of Annesley's place, Castlewellan, says, in reference to these plants:—"I have been much interested in Mr. Burbidge's note on Bamboos in the *Gardeners Chronicle* of May 24, p. 641. Here we have several varieties planted about in the grounds which have grown very well, and have attained a good size; but where the plants are exposed to the east wind, which we get occasionally for weeks at a time, they get badly damaged, and the precaution should always be taken to have them planted in sheltered situations. Bamboos, *Dracena australis*, Pampas-grass, *Phormium tenax*, and its varieties create an agreeable change in ornamental grounds, when they are planted among masses of formal Conifers and shrubs of any kind." The large-leaved variety, which we figure under the above name, is, we are told by Mr. Ryan, grown in an intermediate temperature, and was sent from India a couple of years ago by Lord Annesley, when travelling in that country. The original plant is about 12 feet in height; the leaves are 18 inches long by nearly 4 inches wide.

CYPRIPEDIUM AYLINGI ×, Castle.

This very beautiful hybrid, which was awarded a First-class Certificate by the Royal Horticultural Society on June 10 last, and a Botanical Certificate by the Royal Botanic Society on the following day, is figured and described in the *Journal of Horticulture*, June 12, p. 480, fig. 74, by Mr. L. Castle, and at p. 797, fig. 131, of the present issue. It was raised by Mr. Ayling, gardener to A. J. Hollington, Esq., Forty Hill, Enfield, from *Cypripedium niveum*, fertilised with the pollen of *C. ciliolare*, the cross having been effected about six years ago. A little doubt has been expressed with respect to the pollen parent, some having thought it must have been *C. levigatum*, though I do not share that opinion. Mr. Ayling having kindly brought the plant down to Kew, I have been able to compare it with the two parents, and do not see any very obvious discrepancies, though the characters of the mother plant certainly largely preponderate. But Mr. Ayling tells me that, at the time he made the cross, he had only three species, the two in question and *C. Lawrenceanum*, and that he is certain no mistake has been made. And now, most fortunately, a seedling from *C. niveum* and *C. levigatum* has actually flowered, and which is quite distinct from *C. Aylingi*, will be seen from the following note. The question parentage may, therefore, be considered settled. The figure above-named is good, except that the lobe of the lip is too short. It is certainly the best hybrids that has yet been raised, is pure white, and the segments same ground-colour, with numerous purple dots, which are arranged in lines. There are also a few purple dots on the lip and on the side-lobes, little convex and hairy, with brown veins. The leaves are much

like those of *C. niveum*, $2\frac{1}{2}$ to 3 inches long, by 1 inch broad, bright green, with numerous nerves and transverse veinlets of dark green, which are somewhat obscured by a dense layer of water-bearing cells. *R. A. Rolfe.*

CYPRIPEDIUM VIPANI ×, n. *hyb.*

This is another most lovely novelty, worthy to stand side by side with the preceding one, though quite distinct from it. It was raised in the collection of Captain Vipan, Stibbington Hall, Wansford,

linear-oblong, a little narrower upwards, and sub-obtuse, $2\frac{1}{2}$ inches long, by $\frac{5}{8}$ inch broad; the lip laterally compressed, as in the mother-plant, otherwise strongly stamped with the character of *C. niveum*; the staminode broadly obovate, convex, hairy, especially at the sides, and yellowish-white, with light green reticulated nerves. It is remarkably like *C. × Aylingi* in colour, except that the purple is in clear stripes, not rows of dots, a character clearly derived from the mother-plant, as is also the markedly compressed lip. It is a some-

FIG. 129.—EPHEDRA ALTISSIMA. BERRIES SCARLET-CRIMSON* (SEE P. 791.)

from *C. philippinense* (better known in gardens under its later name of *C. levigatum*), fertilised with the pollen of *C. niveum*. A flower has been kindly sent through Messrs. F. Sander and Co., of St. Albans, and we may hope for a leaf by-and-bye when the plant gets stronger. The lip is pure white, except a few minute purple dots on the side-lobes, and a faint trace of yellow on the nerves. The sepals and petals are also white, with a trace of yellow-green at extreme base, but the upper sepal has eleven, and the petals each nine longitudinal stripes of bright purple. The lower sepals are but faintly striped. As to shape: the upper sepal is exactly ovate, sub-obtuse, $1\frac{1}{2}$ inch long, by $1\frac{1}{4}$ inch broad; the petals

what singular fact that, in all the fine hybrids derived from *C. niveum*, namely *C. × Tautzianum*, *C. × microcheilum*, *C. × Aprodite*, *C. × Aylingi*, and the present one, the characters of *C. niveum* largely preponderate. All are very charming little plants. *R. A. Rolfe.*

SPANISH ONIONS.—The exportation of Onions from Spain to the Spanish colonies of Havanna, Porto Rica, and Manila continues to increase. In 1888, 2390 tons, valued at £7170; and in 1889, 3010 tons, valued at £9120, were sent from Corunna to the above ports.

*1895, Gamble in Hook. *lc. Plant.*

GROWTH OF LEGUMINOUS CROPS.

THE most recent issue from Rothamsted is a pamphlet on the results of experiments on the growth of leguminous crops for many years in succession on the same land, being (with additions) a lecture delivered in November last at the Royal Agricultural College, Cirencester, by Dr. J. H. Gilbert, F.R.S., Siphthorpiam Professor of Rural Economy in the University of Oxford, and Honorary Professor of the College. We may confidently say

to a great extent exhausted of accumulations of nitrogen due to recent supplies by manure, and when, therefore, the plants have to rely largely on what may be called the natural resources of the soil, and on those of the atmosphere. The author next shows the effects of artificial supplies of nitrogen on the growth of the different descriptions of plant, on the amount of nitrogen they assimilate, and on the amount and character of their products. Lastly is adduced evidence of quite other kinds as to the sources of the nitrogen, more especially of the Leguminosæ; a question which has been the subject

either within the soil itself, or in symbiotic growth with the higher plant.

The balance of the evidence recorded is undoubtedly much in favour of the last mentioned mode of explanation. The results of the Rothamsted experiments show conclusively that, by the addition to a poor sandy soil of a small quantity of the watery extract of a soil containing the appropriate organisms, there was greatly increased growth, and considerable gain of nitrogen; and there was, coincidentally, a considerable development of the so-called leguminous nodules on the roots of the plants.

FIG. 130.—A SIKKIM BAMBOO (DENDROCALAMUS SIKKIMENSIS); REDUCED ONE-FOURTH. (SEE P. 792.)

there is no agricultural treatise bearing upon this subject in which so much valuable and practical matter has been condensed in such very small space, and we need scarcely add that the most experienced will find much to learn by the perusal of the sixty pages of which the work consists. Our space will only allow of a very brief outline of the general considerations of this vast and important subject.

The author first calls attention to the difference in the amounts of nitrogen assimilated over a given area by different crops, when each is grown for many years in succession on the same land, without any nitrogenous manure, or when grown in alternation one with another, also without nitrogenous manure—that is to say, under conditions in which the soil is

of experimental inquiry, and at times of active controversy, for about half a century; which has in recent years assumed a somewhat new aspect, but which cannot even yet be said to be conclusively settled.

Thus the various modes of explanation of the observed gains of nitrogen by plants are:—That combined nitrogen has been absorbed from the air, either by the soil or by the plant; that there has been fixation of free nitrogen within the soil, by the agency of porous and alkaline bodies; that there has been fixation by the plant itself; that there has been fixation within the soil (or by the plant), by the agency of electricity; and, finally, that there has been fixation under the influence of lower organisms,

The conclusion being, not that the leguminous plant had directly utilised free nitrogen, but that the gain was due to the fixation of nitrogen in the growth of the lower organisms in the root-nodules, the nitrogenous compounds so produced being taken up and utilised by the leguminous plant. It would seem, therefore, that in the growth of leguminous crops, such as Clover, Vetches, Peas, Beans, Lucerne, &c., at any rate some of the large amount of nitrogen which they contain, and of the large amount which they frequently leave as nitrogenous residue in the soil for future crops, may be due to atmospheric nitrogen so derived. It has yet to be ascertained, however, under what conditions a greater or less proportion of the total nitrogen of the crop will be

derived, on the one hand, from nitrogen compounds within the soil, and on the other from such fixation. The probability seems to be that the proportion due to fixation will be less in the richer soils, and the greater in soils that are poor in combined nitrogen, and which are open and porous.

CONCLUSIONS.

Whether, therefore, we consider, says the author, the facts of agriculture generally, or confine attention to special cases under known experimental conditions, the evidence does not favour the supposition that a balance of fertility is maintained to the soil by the restoration of nitrogen from the large store of it existing in the free state in the atmosphere.

Further, our original soil-supplies of nitrogen are, as a rule, due to the accumulations by natural vegetation, with little or no removal, over long periods of time. Or, as in the case of many deep subsoils, the nitrogen is partly due to animal remains intermixed with the mineral deposits. The agricultural production of the present age is, in fact, so far as its nitrogen is concerned, largely dependent on previous accumulations; and, as in the case of the use of coal for fuel, there is not coincident and corresponding restoration, so in that of the use or waste of the combined nitrogen of the soil, there is not evidence of coincident and corresponding restoration of nitrogen from the free to the combined state.

In the case of agricultural production for sale, without restoration by manure from external sources, a very important condition of the maintenance of the amount of nitrogen in the surface soil, or of the diminished exhaustion of it, is the growth of plants of various range and character of roots, and especially of leguminous crops. Such plants, by their crop-residue, enrich the surface soil in nitrogen. It is, as a rule, those of the most powerful root development that take up the most nitrogen from somewhere; and this fact points to a subsoil source. But, independently of this, which obviously may be held to be only evidence of the necessity of obtaining water and mineral matters from below in amount commensurate with the capacity of acquiring nitrogen, direct experimental evidence can leave no doubt that such plants do obtain, at any rate, much of their nitrogen from the subsoil.

The question arises, Whether or not the whole of the nitrogen of our crops comes from combined nitrogen in the soil and subsoil, in manure, and in rain, &c., or whether part of it is in some way derived from the free nitrogen of the atmosphere? Cumulative evidence points to the conclusion that, in the case of our gramineous, our cruciferous, our chenopodiaceous, and our solanaceous crops, free nitrogen is not the source. Recently-acquired evidence indicates, however, that it may indirectly be the source of at any rate some of the nitrogen of Leguminosae.

It would seem that the development of the organisms capable of bringing free nitrogen into combination, if not an essential coincident of the growth of some leguminous plants, is at any rate favoured by such growth. *J. J. Willis, Harpenden.*

INDIA.

MADRAS FOREST DEPARTMENT:—According to the report for the year 1888-1889, a copy of which has just reached us, the most favourable results have been obtained with the introduction and culture of the Date Palm. It has been conclusively proved that the Eucalyptus cannot be grown in the plains except perhaps at an expenditure which is prohibitive. The Mahogany did well in Chingleput and North and South Arcot, and at the foot of Nilgiris, but in the Wynnad the results were disappointing, and the district forest-officer of Trichinopoly fears that the district is not suited to it. The experiments with giant Bamboos were most encouraging.

Confess.—The Nilgiri planting experiments show conclusively that the best species for cultivation on the hills are—*Pinus longifolia*, Himalaya; *P. mari-*

tima, S. Europe; *P. insignis*, California; *Frenela rhomboidea*, Australia; *Cryptomeria japonica*, Japan; *Capparus macrocarpa*, California; *C. torulosa*, Himalaya.

The Conservator, Mr. Gamble, proposes also to try the Californian red-wood (*Sequoia sempervirens*) and the European *Pinus laricio*, as likely to succeed. Seed of *Podocarpus elongatus*, which were received in 1883 from Mr. Hutchins at the Cape, has also done fairly well; so, too, has the Assam *Pinus kasya*. The collector of Vizagapatam has tried to grow *Cryptomeria* on the Milkotam hills, and there are about forty healthy plants. It is doubtful, however, if they can stand the hot weather.

Casuarina suberosa has been very successfully grown on the Nilgiris, and can be planted there as easily and cheaply as *Casuarina equisetifolia* in the vicinity of Madras or Bangalore. The Sikkim *Bucklandia populnea* is also a success in Nilgiris, and more seed may be procured, as it is a useful timber, as well as being a very beautiful tree. The Darjeeling Maples, *Acer Campbellii*, *lavigatum*, and *Hookeri* still grow, but cannot withstand the frost without protection. The same is the result with *Grevillea robusta*. *Acrocarpus fraxinifolius* has been found to grow wonderfully quick at Anantapur, and on *Illesykonda*, in Cuddapah, which is an interesting thing.

Although the superior staff was undoubtedly inadequate for the charge of so large an extent of forests, yet the area under control was increased by over 800 square miles, and a larger proportion of it was put under special protection, while the out-turn of both timber and minor produce made a considerable advance, and the sales yielded a larger surplus revenue than has ever yet been obtained.

The financial results of the year's working are very satisfactory, the surplus revenue being nearly three lakhs of rupees.

CLIMATE OF MADRAS.

The hottest day in the year 1889-90, in the shade, was May 21, when the thermometer reached 108° F.; the coldest night was December 1, when it fell to 61° F. The mean maximum temperature in the shade was 90° F., and the mean minimum 74° F. There was a rainfall of 43.39 inches, distributed over eighty-four days. The rainfall was deficient, and failed worst at the second half of the north-east monsoon. The deficiency was in a great measure made up, however, by the effect of two distant cyclones, about December 18 and 26, which together gave nearly 12 inches of rain. No cyclone visited Madras during the year.

PLANTS AND THEIR CULTURE.

THE COOL CONSERVATORY.—At this date the conservatory will require a thorough rearrangement, and many plants may be placed in it to advantage which could not bear the low temperature at other seasons. Such plants furnish useful specimens, which are better admired than when standing in the stoves. Many of the usual occupants of the house may be placed in the open, if the roots get some kind of protection from the sun, and the plants are well attended to with water. Many species of Palms and other fine-foliated plants in the stove will have made their growth, and the hardier species may be placed for the next two months in the conservatory. Ferns may also be included among such plants, if shade can be afforded them. Before commencing, the creepers should be regulated, and any cleansing of plants or walls should be finished. If the creepers are infested with insects, the plants beneath them must be removed and cleaned with an insecticide.

The *Lagereria* is liable to thrips, and should be syringed with tobacco-water to which a little soft-soap has been added, and care taken to thoroughly wet all parts. *Taconias* are lovely climbers for the conservatory, but are so subject to scale that constant attention is required if they are to be kept clean. If at all dirty, no time should be lost in overhauling these plants, and in many cases removing a large portion of the foliage if it be in a bad state, so as to avoid infesting the fresh inmates. *Coleus* are good decorative plants, and if propagated as advised some three months ago, will now have made good growth. They should be grown of different sizes, and get a very light position. Successions should be grown. *Franco racemosa* is also a useful plant, the long

graceful spikes of pale pink and white being effective, and they last a long time; and if the plants get some stimulus, they throw up a second lot of bloom. Campanulas are telling plants, and last a long time in good condition, and may be grown with but little trouble, requiring no heat after raising the seedlings, but simply a cold frame through the winter, and when seed is sown early in the previous spring, they make nice specimens in 8-inch pots. The most useful are *C. calycanthema*, the Canterbury Bell, and *C. pyramidalis*, blue and white-flowered. If these are kept well watered and liberally manured, dead blooms being removed, they will endure for a long time.

Nicotiana affinis is a charming plant, and one that is readily raised from seed. Successions should be raised by making several sowings, the first being made in March. The different varieties of *Begonias* remain a long time in bloom; *Marguerites* are pretty when intermixed with dark foliage or flowers, and these if grown in two or three lots, pinching the later lots, are very valuable throughout the summer. *Rhodanthes* look well in small pots on the fronts of stages. *Celosias* last a long time if kept clean and free from red-spider, as also *Schizanthus* in variety when sown in the autumn, and during winter just kept out of the reach of frost. Many others might be mentioned were more space at my disposal. *G. Wythes, Syon House, Brentford, W.*

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—Cleanliness should be now well attended to, for should thrips once get a footing they will be difficult to get rid of before winter arrives. The plants most likely to be affected are *Phaius tuberculatus*, *Epidendrum dichromum* and species of *Phalænopsis*. These plants should be examined daily, especially the under sides of the leaves of *Phalænopsis*. The presence of thrips is indicated by a honey-like liquid on the leaves, which are dotted over with black spots, and when these marks are observed, spraying should be at once done with soft-soap water.

Cypripedium Morganianum now in flower, undoubtedly one of the finest of the genus, is also the freest grower. I have been asked several times if this is not a shy flowerer; this is not my experience of the plant.

Angraecum Scottianum is a beautiful subject, well worth the attention of the cultivator. Grown in the East India-house, it does well whether placed on bare rafts or in baskets with potsherds and sphagnum moss, doing equally well in either way. *Vanda Denisiana*, a plant now coming in flower, is distinct in colour from any other *Vanda*, and grows very freely in this house, but it should be afforded a long season of rest, keeping it comparatively dry at the root. The resting season is from November to April. *Odontoglossum Londeborghianum* is now growing rapidly; and I would warn growers of this plant to be careful not to allow water to settle in the centre of the young growths, this being in most cases fatal to them.

The earliest flowering plants of *Dendrobium*s such as *D. heterocarpum*, *mobile*, and *Wardianum*, should now be finishing up their growth, and although I deprecate the early removal of these plants from the quarters in which they have made their growth, they should not be left there to break again into growth from the base of this year's pseudobulbs. In removing the plants to a drier and better ventilated house, the plants should not be allowed to become dry; and no better place can be found for the ripening of them than ainery which has been early forced. *Mormodes pardinum* and its varieties are now growing fast, and if these plants were potted in fibrous peat and sphagnum moss they will be all the better for some weak diluted liquid manure once a week—guano or cow manure is perfectly safe to use.

Calanthes are now growing very fast, but I would not advise anyone to give liquid manure to these plants yet. The fuller the pots of these plants get with roots, the oftener will they require water, but I do not believe in the application of manure too soon; as a rule, before giving manure water it should be perfectly safe to seize the plant by the foliage and swing it around without injuring it in any way. A buoyant atmosphere must be kept up by admitting air at bottom and top, and any house in which the air feels oppressive is not conducive to healthy plant life. The temperature may range from 75° at night as the minimum, and should reach at least 15°

higher after closing it in the afternoon. *A. G. Catt, Parkfield, Hallow.*

THE FLOWER GARDEN.

CARNATIONS AND PINKS.—Carnations should have their flower stalks tied neatly to small stakes, and flowers required for exhibition purposes should have the buds thinned out. To have good young plants for flowering next year, layering should be done as soon as the first good blooms are past. Carnations struck from cuttings involve less labour, and if well attended to produce good plants, which will, like layers, flower next year. For striking cuttings of Carnations and Pinks, a slight hot-bed should be made use of; a disused Melon bed of manure and leaves is a good one for the purpose. The old materials of loam, &c., should be taken away, and 4 inches in depth of very sandy soil consisting of half leaf-mould, loam and sand, be put in its place. Insert the cuttings of Pinks 3 inches and Carnations 4 inches apart, keeping the hand glasses which are used to cover the cuttings close, and after the first watering, only a moderate amount of moisture should be afforded them and but little shading until rooting takes place. Harden off the plants by degrees, and plant out in the autumn in beds properly prepared.

Herbaceous Borders.—Now gay with Pæonies, Pyrethrum, Delphiniums, Aquilegias, &c., must be kept clear of weeds, the plants put into a trim condition with supports and ties, and the vacancies filled up with annuals or other plants.

Perennials.—There should be no delay in getting seed of hardy perennials sown; and this is the best and cheapest way in which to raise a stock of herbaceous plants.

American Plants.—Most of the Rhododendrons, Kalmias, and Azaleas are past their flowering season, and the seed-pods should be removed so as to assist growth. Most plants which grow in peat and light soils make roots near the surface of the soil, hence the importance of not forking it deeply; in fact, they do better if the weeds are hoed off and the beds kept clean in that manner, and in the dry season mulched with leaf-mould or Mushroom bed manure.

Bolting Plants.—In dry weather the beds, and especially those consisting of annuals recently transplanted, should be copiously watered, and some kind of light mulching made use of for with. It is not always that this can be done, in that case frequent stirring of the surface with a Dutch hoe will be the next best thing to do.

Roses.—The buds of Roses in this garden have this season been much damaged by the Rose worm. Unremitting attention had to be given to the bushes, picking off with the hands, &c. Roses whose first bloom is over should have the shoots shortened, the roots mulched, and be kept moist in order to assist the development of wood for autumn blooming. Strong and vigorous growths should also be shortened, which will tend to equalise the flow of sap. *D. C. Powell, Powderham, Devon.*

FRUITS UNDER GLASS.

PINE-APPLES.—The early QUEENS now ripe or ripening still have the bottom-heat maintained at 80°, or the fruit stems will shrivel, and the fruit ripen prematurely, and possess but a small amount of juice or flavour. Upon the first signs of colour showing, cease to apply stimulants, and give water sparingly. As soon as the fruit is cut, shorten back hard all the old leaves upon selected plants, with a view to giving space for stocky suckers to develop, one sucker on each, unless the stock of any particular variety is scarce, when two may be left. Do not take off any sucker until it has reached a good size and put forth a dozen or more of sturdy leaves, as suckers make the best progress on the parent plant, and it is a mistake to pot small suckers at any time, and whatever pains may be taken with suckers, will assuredly be repaid in fine plants and big fruits. It is a good plan to arrange the shortened back stools in a bottom-heated pit, close to the glass, and provided with ventilation, to prevent the suckers becoming drawn. Any suckers which may have become ready may be potted up; and make sure of getting a good number prepared for taking off in the month of August. These will become

established before the short days arrive, and go safely through the winter; and some of them will have ripe fruit in the autumn and winter of 1891 and 1892—that is, from 12 to 16 months from the date of taking the suckers.

Suckers put in at old times are often useful in providing successional fruits, but they require to be watched carefully, so as to re-pot them the moment they are ready. Strong fibrous loam, with a little fresh bone-dust and some sharp grit, or finely-sifted old mortar rubble, to keep the compost porous, after the decay of the fibre in the loam, will produce good weighty fruits. This should be firmly rammed into the pots. The pot system has advantages over planting in beds, where ripe Pines are required the whole year round. Pineries having a south aspect, with a roof at an acute angle, will need "hexagon netting," or some other light movable shading put over them for a few hours daily in bright sunshine. During sunshine ventilate freely by the side ventilators, and reduce size of the openings at the top in order to preserve the humidity of the air; and endeavour to secure a gentle circulation by admitting the fresh air through a number of small apertures at the side, in preference to a few large ones, for the latter, whether at the top or the bottom, are certain to cause aridity and hurtful draughts. Reduce the fire-heat to a minimum, except for bottom-heat requirements, or in dull or damp weather, and whenever the sun causes a high temperature by day, the night temperature may be safely allowed to fall as low as 60°. The plants should be dewed gently overhead with a fine syringe just before the sun leaves the house, first reducing the amount of air and closing immediately after syringing. At the same time damp down the beds, walls, paths, and dry surfaces with water charged with ammonia. Put on a little fresh air at twilight, for it is equally necessary to retain a slight circulation of fresh air during the night as during the day. A damp, stagnant atmosphere should always be guarded against, as being extremely injurious. Allard strong successions and fruiters growing vigorously, with pots full of roots, liberal supplies alternately of farmyard liquid manure, guano and soot-water, and always give it in a clear state and properly diluted. Smooth Cayennes require more water at the roots when in active growth than most of the other varieties, and enjoy a higher temperature, generally speaking; whilst for winter use the first named and Black Jamaica are unsurpassed. Now is a good time to give a short rest to strong plants of these varieties, so as to enable them to mature their growth, in preparation for harder forcing. When thus treated the plants will almost immediately show good deep fruit ripening in succession from October onwards.

It is a mistake to expect that the largest plants will give the best fruit, results often proving the contrary, but short, broad-leaved plants always finish well. *W. Crump, Madresfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

ORCHARD TREES.—Grafts should now have the binding taken off, and in the case of strong shoots, be re-bound with soft matting. Now that grafts are in active growth, the shoots below the graft should be reduced in number, and those remaining should be cut back to three or four leaves. Fruit in orchards is very partial in this locality, and I fear generally. Trees which carry light crops, or none at all, usually make strong growth, but this must be regulated by stopping the shoots and thinning them where crowded, so as to allow them to mature.

Apple trees which have been infested with caterpillar should be encouraged to grow by manual stimulants, and then, if we have a fine ripening autumn, they will finish up well. There are hundreds of Apple trees hereabouts, which look as if there had been a fire beneath them.

Trees on light soils require to be watered in a dry time, otherwise growth will be poor, and mildew may appear. The best remedy against mildew is flowers-of-sulphur dusted on the affected plants.

Fig trees trained on walls should have the young bearing shoots stopped at five or six joints from the base, weakly shoots being cut away, and the fruit where crowded should be thinned out. Where the roots are confined in narrow borders, frequent waterings with liquid manure at this season will be very beneficial.

There appears to be a larger demand for Quinces and Medlars than formerly prevailed; and any trees

carrying good crops should be aided by manuring and watering them in dry weather.

Desert Cherries.—These fruits are just beginning to colour in this garden, and must now be protected from the birds, and syringing of the trees discontinued. If the black aphid has established itself ever so little, it should, nevertheless, be cleared out from amongst the fruits, or it will render them dirty and unsteady. There is no better remedy for this than to crush the aphids with the finger and thumb, and when they are abundant on unfruitful shoots, some tobacco-powder puffed on to them when damp will clear them out.

Strawberries that were Forc'd.—No time should be lost in getting all of these that are required, planted. The ground selected for the crop should be in good heart, and well tilled, and after making it quite level and smooth, put out the Strawberry plants in clumps of three, or in rows of single plants, varying the distance they stand apart a few inches, according as the variety is a strong grower or otherwise. Layering may commence as soon as runners are procurable. My method is to plant in the autumn a few rows of each variety I intend to force, and keep the blooms picked off them, and from these plants the runners for forcing are taken. The runners, in consequence of the deprivation of flowers, soon appear, and the best of these are layered into 3 inch and potted afterwards into 5-inch pots for fruiting. Later batches are layered into their fruiting pots of 3 1/2, which is certainly time-saving. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN.

WATERING CROPS.—In order to keep up a supply of firm, crisp vegetables in the absence of rain, abundance of water, liquid manure, and mulching with rich manure should be afforded them. Peas are the first to suffer from short supplies of any of these, and should be well mulched and repeatedly drenched with water, especially on light or shallow soils. Scarlet Runner and French Beans will also benefit by having mulchings applied to the soil over the roots, and when dung is scarce, grass mowings may be used instead, and with fairly good results. Lettuce, Onions, and Cauliflower, if large heads are required, should receive timely attention as regards manurial aids to growth. Break the leaves, or tie them over the heads of Cauliflower turning in; and cutting the heads early in the morning.

Broccoli.—As the ground becomes cleared, get the main crop planted before the plants get drawn, and the firmer the soil is made for this crop, the better will they resist frost. An open position is the best for Broccoli, and do not plant too close together, planting in drills of moderate depth, and watering well after planting. Snow's, Adams', Knight's Selt-protecting, Goshen, Ledsham, Model, and Gilbert's Victoria, are all good Broccolis, and may be fully depended on for succession until late in the season.

Endive. during the summer months, when Lettuces are plentiful, Endive is but little required, but for winter use it should be grown in plenty. The moss-curled does not keep so well as the Digswell Prize, Green Curled, or Batavian. For the first supply, a sowing should now be made, repeating the sowing at intervals till the first or second week in August. Sow thinly in shallow drills, 6 inches apart, on prepared beds, made moderately firm; in dry weather, cover the beds with mats till the seedlings appear, and when large enough, plant out on rich ground in an open aspect. The later crops do best on a slightly sloping border, sheltered from the north.

Cypripedium in pots should be well supplied with weak manure-water, and in cold districts afforded the aid of a frame. Syringe the plants slightly overhead on bright afternoons. They do well planted out in southern parts of the country, if previously well established in pots. See that the mass of soil in the pots is well moistened before being put into the earth. *H. Markham, Mereworth Castle, Maidstone.*

NEW PEAS.—Amongst several very promising cross-bred Peas at Messrs. CARTER'S trial-ground, there is one to be called "Carter's Phonograph," which is said to bid fair to prove as novel and valuable in the vegetable world as the remarkable instrument from which it takes its name in the world of mechanics.

EDITORIAL NOTICE.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

WEDNESDAY, JULY 2. } Royal Botanic Society: Evening Fête.

THURSDAY, JULY 3. } Established Orchids, chiefly in flower and bud at Stevens' Rooms.

FRIDAY, JULY 4. } Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62° 8.

amateur is possessed of the sacred fire even to a small extent, then by all means let him undertake the culture of herbaceous and rock plants in suitable situations, and amid appropriate surroundings. He need not, unless he choose, entirely discard flower-beds, and other artificial devices. These were at one time grossly abused, but, under restrictions and in certain circumstances, they are appropriate enough.

The Royal Gardens at Kew, where we may fairly look for illustrations of all styles, have, for the last few years offered many excellent examples of successful flower-bedding at once satisfactory to the artistic eye, and to the intelligence of the plant lover. Indeed, we cannot do better than advise those who are concerned in the matter, to visit the Royal Gardens, and note the varied manners in which herbaceous plants and ornamental shrubs are disposed, from the severe, gridiron arrangement, which is supposed, erroneously, as we think, to be the best suitable for purely botanical purposes, to the flower-beds, the very beautiful beds of variegated shrubs, the wild bank, and the ever-charming rock garden. Of course, with the resources of Kew, much can be accomplished at all seasons; but he must be a very inapt pupil who cannot learn from what is done on a large scale at Kew, much that will be of service to him on a small scale elsewhere. By visiting Kew or Glasnevin, Edinburgh or Cambridge, or any good private gardens, at various seasons, the amateur will speedily make his choice what style he will adopt, and then he will appreciate the value of the advice given by Mr. WOLLEY DOD, and which we presume will shortly be made public in the *Journal* of the Society.

It must suffice to say, that the paper dealt with the general principles of cultivation in their special application to herbaceous plants. The necessity for draining certain soils was insisted on, and an excellent test given whereby the cultivator might determine the necessity for drainage. If *Gentianellas*, *Hepaticas*, or Christmas Roses, keep their leaves well, then the soil may be considered sufficiently drained. The means of dealing with heavy or light soils were detailed, digging deprecated, division and replanting advised at the proper time. The proper arrangement of the plants came also under review, and here the truth of the statement that the successful cultivator must love his plants received illustration, it being shown that the "habit" and requirement of each individual plant, must be studied as well as the situation wherein it is grown, and the purpose for which it is cultivated. Adaptation to circumstances, rather than slavish imitation of Nature, was counselled by Mr. DOD, who had in view a memorable discussion in these columns a short time ago. Various modes of propagation were explained, and warnings given as to the most obnoxious vermin. Labels and names came in for consideration, and the treatment of such details as tying up will show how thoroughly the matter was treated. Every practical gardener knows that Mr. DOD is master of his subject. If proof were wanting, it would be found in the admirably comprehensive yet concise and lucid manner in which he conveyed his information. The Royal Horticultural Society now happily comprises many new Fellows and amateurs, who will appreciate Mr. DOD's paper when it comes before them in print in the *Journal* of the Society.

"KEW BULLETIN."—An appendix to the volume for 1890 contains a list of all the new introductions recorded during 1890 in the principal horticultural

journals. Such a list is very valuable. There is a diversity of practice, however, in the spelling of some of the names, which is confusing; thus we have on the same page *Anthurium Allendorfi* X., *Grusoni* X., *Orgiesii* X., *Wittmackii* X., in which the second name is spelt with a capital initial letter, while *A. andreanum* and *A. chan'ianum* X., *A. houlettianum* X., *haryanum* X., and *scherzerianum* are spelt with a small letter. Similarly in succeeding paragraphs we find *Aster Ilverys* and *Aster lindleyanus*. The discrepancy exists throughout the list. Desirable as it is to have all these names, good, bad, and indifferent, recorded in one publication of easy access, the authorities at Kew would do excellent service by annually, or at fixed periods, revising the nomenclature so far as circumstances permit, and certainly by changing, if not excluding, all misleading names, such as those Latin ones applied to garden varieties often, botanically speaking, of the most trifling character, but which are so constructed as to convey the impression that the plants are species duly registered, described or figured by some responsible botanist.

A NEW ORCHID JOURNAL.—The Viscount DE SAINT LEGER informs us that he is about to publish monthly a journal devoted to Orchids and their culture. It will be published at Rio Janeiro in Latin and in Portuguese, and each number will contain two coloured plates. M. DE SAINT LEGER is well known for his discoveries of Orchids, including the very handsome *Cyrtopodium Legerianum* and others, so that we look forward with interest to his new venture.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of the above Society was held on the 17th inst. at 8 P.M. in the schoolroom, the Rev. A. E. W. LOFTS presiding, the attendance being good. Some fine examples of decorative *Pelargoniums*, *Roses*, *Peas*, *Lettuces* and *Cabbages* were staged by Messrs. ELLIARD, RIDING, and OSBORNE; and an interesting paper was read on the cultivation of vegetables in June by Mr. W. PAVEY, followed by a discussion.

NEW VEGETABLES.—Messrs. PAULLEX & BOIS describe, under the name of *Mandera Cucumber* (*Cucumis Sacchubii*), what M. NAUDIN considers a new species. It was introduced from Zanzibar, and promises to be useful for pickling.

Rot Turnips.—Messrs. PAULLEX & BOIS also bring under notice a Turnip of top-like form, red colour, and strong flavour. It is adapted for garnish and for steaks. It is known as *Gongoulon du Kashmir*.

Amphicarpaea monica.—This is a plant which matures its pod underground, and which would supply a fresh vegetable throughout the winter. The seeds also may be used like *Haricots*.

Mitsuba.—The culture of this Umbellifer (*Cryptotaenia canadensis*) is recommended as a salad when blanched, or, in the natural condition, cooked as Spinach.

Olanbe.—A species of *Solanum* (*S. Pierreanum*) from the Gaboon, with scarlet berries of an ornamental character, and which may prove useful. *Abstract from the "Revue des Sciences Naturelles Appliquées."*

CHINESE DYES.—The British Consul at Newchwang, China, in a recent report says:—"It is worthy of remark that no aniline dyes were imported in Newchwang last year. It is said that the Chinese have come to dislike these dyes, and to find that those which they make themselves are more serviceable and cheaper in the end. So they are returning to the use of Sappan wood, and their own dye stuffs." This item of information will be hailed with satisfaction by admirers of Chinese art.

MR. GLEESON.—We hear that this well-known gardener has left Clumber, Nottinghamshire, and is now seeking another situation as gardener.

Herbaceous Plants. MR. WOLLEY DOD'S lecture on the culture of these plants at the meeting of the Royal Horticultural Society on Tuesday last was, as might have been anticipated, full of sound practical hints and valuable counsel. Mr. DOD did not say in so many words, that to succeed with herbaceous plants the cultivator must love them, and, consequently apply all the intelligence he can command to their cultivation; but this truth was sufficiently obvious, without express pronouncement. With bedding plants, all that the "lover of a gay garden" need do, is to go to the nearest florist, buy as many as he wants, and hire a man to put them in for him. If he has no real fancy for plants as plants, but only as objects of display, this process will satisfy him, and he will ignore blissfully, at any rate carelessly, the far greater and more varied pleasure to be had from the cultivation of, and, as we may say, friendship with herbaceous plants.

We are not all alike in our tastes and preferences. Gardening offers charms to all classes, and adapts itself to an infinite variety of circumstances. There is no need, therefore, to scoff at people whose ideas and predilections differ from our own, only, for their greater comfort, it is as well to warn those who are not botanically inclined, that they will derive more satisfaction from the bedding out system than they will from the culture of herbaceous plants. Devoid of knowledge, and wanting in sympathy, their herbaceous borders are likely to become wildernesses, where the fierce struggle for existence, and the fiercer competition of rivals, will result in a condition of affairs which is not without its interest for the philosopher, but which is by no means pleasing to the eye of the amateur—still less satisfactory to the gardener. But if the

"BOTANICAL MAGAZINE."—The June number contains coloured illustrations of the following plants:—

Carludovica caput meduse, t. 7118.—A striking-looking Pandanad, with a tuft of stalked, palmate, and deeply cleft leaves. The inflorescence consists of a globose head of flowers, densely packed upon a short, stout bracteate stalk. It flowered at Kew in 1887, but whence it came is not known.

Rosa multiflora, t. 7118.—The single form of the beautiful Rose, often called polyantha in gardens, and which has several aliases. See also *Gardeners' Chronicle*, 1876, vol. vi., 137; and 1887, vol. ii., p. 659.

Hemiorchis burmannica, t. 7120.—A Scitameneous plant that flowered at Kew last year. It has oblong plicate leaves, springing from a creeping rhizome.

Street, S.W., on Tuesday evening last, when there was a good attendance of members and friends, including several leading rosarians. The Very Rev. Dean Hole presided, and, on behalf of his brother rosarians, presented the Rev. H. H. D'OMBRAIN with a gold watch (suitably engraved), as a mark of their esteem for the great services he has rendered to the popularisation and the cultivation of the queen of flowers. It will be remembered that Mr. D'OMBRAIN unfortunately lost his watch at the National Rose Society's exhibition last year.

NAME THIS CHILD!—The following reaches us from the Cape:—"It seems to me injudicious to name children after plants, unless their names have been long consecrated by poetry or romance. Rose and Lily will do passing well, and Daisy has a sort of

shalon, Mr. G. W. CUMMINS, wishes us to announce the holding of a Rose fair in aid of the Fund on the occasion of the Croydon Horticultural Society's Show, on Wednesday, July 2, at Brickwood House, Addiscombe Road, Croydon. Contributions of any cut flowers for sale purposes will be gladly received, and should be addressed: "Rose Fair Tent," Croydon Horticultural Society, Brickwood House, Addiscombe Road, Croydon."

LOUCHBOROUGH HORTICULTURAL SOCIETY.—The thirty-third annual exhibition of the above Society, fixed for Wednesday, July 23, promises to be one of the best held in the Midlands, exhibits for competition, and otherwise, having been liberally promised by many of the gentry and gardeners of the neighbourhood.

FIG. 131.—CYRTOPODIUM AYLMERI. THE WHITE SEGMENTS ALSO WHITE, WITH CRIMSON SPOTS AND BLACKISH BARS. (SEE P. 792.)

and spikes of reddish-brown flowers, very Orchid-like in appearance.

Tillandsia amethystina, t. 7121.—One of the Vriesea section, native of South Brazil. The flowers are yellow, in loose spikes, proceeding from a tuft of reflexed strap-shaped, entire, purplish leaves.

Allamanda violacea, t. 7122.—A species with tomentose shoots, verticillate, sessile, oblong leaves, downy beneath, and with flowers in cymes. The sepals are lanceolate, downy, the corollas about 3 inches long, with a narrow, cylindrical tube, expanding suddenly, about the middle, into a broadly funnel-shaped portion, twice the length of the limb, which latter consists of fine rounded, spreading or reflexed violet segments. Kew.

HORTICULTURAL CLUB—The usual monthly dinner was held at the Hotel Windsor, Victoria

shepherdess air. Fuchsia has been used in some Yankee novel for an unconventional heroine. Battercup will not do—it suggests SULLIVAN and comic opera. *Fragaria* would not be bad, nor perhaps *Fritillaria*. But I can promise those parents who simply want some very out-of-the-way name for their offspring a perfect embarrassment of choice if they will only go a little further than these common plants. I suggest some as a beginning:—*Hicksbeachia*, *Czackia*, *Tchihatchewia*, *Pokornia*, *Schyckowskyia*, *Schwackea*, *Ulloa*, *Grimmia*, and guarantee them all correct and known to science, with lots more, as fearfully and wonderfully made, in *DUNHAM'S Index*. I make no charge for this first instalment."

A ROSE FAIR AT CROYDON.—The Hon. local Secretary of the Gardeners' Orphan Fund at Car-

W. H. BAXTER.—We greatly regret to have to chronicle the death of Mr. W. H. BAXTER, the ex-Curator of the Oxford Botanic Garden. Mr. BAXTER was in his seventy-fifth year, and died on the 19th inst. He was the son of WILLIAM BAXTER, a botanist of great repute in his day, and one to whom many undergraduates and dons owed their initiation into the mysteries of botanical science. WILLIAM BAXTER was Curator under the reign of Dr. WILLIAMS, a scholar and an estimable man, but one whose knowledge of the subject he had to teach was reputed to be by no means equal to that possessed by the Curator. Dr. WILLIAMS was succeeded, in 1834, by Dr. DAUBENY, who was Professor alike of Chemistry, of Botany, and of Rural Economy—a valiant and persevering advocate for the introduction of natural science into academic teaching, at a time when its claims were far less widely admitted than now, and

a man who by his talent, his broad sympathies and his generosity, must always be held in high respect. In his time the garden was re-organised and laid out by W. H. BAXTER, in a manner at once consonant with the requirements of science and of landscape gardening, and its maintenance was, moreover, greatly facilitated by the munificence of Professor DAUBENY. W. H. BAXTER, in the early part of his career, was an assistant to LONDON, and took part in the compilation of several of those useful books to which LONDON attached his name, and for which he became famous. BAXTER afterwards became Superintendent of the public gardens at Bath, but when the health of his father gave way, he took charge of the Oxford garden, and retained it for several years, having latterly the charge of the "Parks" also. A few years ago, owing to failing health, he retired upon a small pension. W. H. BAXTER was a man of taste in matters of landscape gardening, adopting the picturesque rather than the formal style; many gardens in the vicinity of Oxford were, we believe, laid out by him. His knowledge of plants was very extensive; his abilities as a cultivator were of a high order. Personally, he was modest, amiable, and obliging, so that he secured the highest esteem of all whose pleasure it was to know him; and his retirement from the Botanic Garden, so long under the charge of his father and himself, was felt by those who knew the garden to be a painful severance of old ties, and the break up of many associations.

HOME CORRESPONDENCE.

JUSTICE v. INJUSTICE.—In the Lambeth County Court recently, a case came on for hearing, in which a gardener sued his late employer (a nurseryman), for a week's wages in lieu of notice. The facts of the case were these:—Plaintiff was employed by defendant at a certain wage per week as propagator and grower of soft-wooded plants, and in that capacity he remained for a period of two years. About the end of the month of April of this year a man, who was working under plaintiff's orders, refused to obey instructions; plaintiff, therefore, reported his conduct to his employer, who treated the matter with absolute indifference, and this rather annoying plaintiff, he gave a week's notice to leave. This notice, however, his employer refused to accept, but requested him to leave the premises at once, absolutely and entirely, without giving him any reasons for such a proceeding, and at the same time refusing to pay him a week's wages in lieu of notice. Plaintiff, therefore, sued defendant in the county court, but was nonsuited through not being able to prove that it was the custom of the trade to give or receive a week's notice. The defendant and a witness swore that it was not the custom of the trade, the judge also ruling that unless a compact was made for a week's notice on either side at the time plaintiff entered defendant's service, defendant was justified in discharging plaintiff at a moment's notice. Now, I should like to hear the opinion of others in the trade on this subject. I, myself, can scarcely believe that the decision of the judge can be a correct version of the law. If this really is the state of the law, I think that at least ninety per cent. of the readers of this paper will agree with me that it is a decidedly unjust law, and ought to be amended. Supposing now this to be the law: If a man holding a responsible position were to go to his employer and demand his money up to date, telling him he was going to leave at once, what could that man expect but a refusal, when applying to him for a reference? yet, on the other hand, according to the judge's decision in this case, a master can turn a man off his premises at a moment's notice without giving any reasons for so doing. Of course, we all know that a jobbing gardener is employed by the day, and therefore only expects a day's notice; but a man employed under glass, I have always understood to be a weekly servant. *One who wants to know.* [We should like to hear what the other side may have to say before making any comments on the above. Ed.]

TOMATOS FOR AN EARLY CROP.—I am growing this year some varieties of Tomatos to test earliness. Horsefield's Prelude has proved itself to be the best, it setting freely without artificial fertilisation, indeed

it sets too freely, for if all the fruits are allowed to grow they would be very small. If the fruits of this variety could be got of a larger size, it would be still more useful. Ham Green, which is larger, does not set so early, and makes a succession to it. I think the new cross, viz., Chiswick hybrid, or Conference, will be a very useful one with the freedom to set off Prelude and larger fruits. We have been gathering Prelude in quantity for the last month from plants raised in the first week of January. Wherever grown, thinning the fruit must be practised if fair-sized fruits are desired. Small fruits are sometimes useful for garnishing, and in salads; but the larger ones are more generally useful. Prelude grows well in small pots, and makes less wood than others—an 8-inch pot is large enough. After the first set, I find Thomson's Vine Manure a good stimulus to growth in pots-plants. I have employed it and several other manures this season; but Thomson's is the best, the foliage not being produced at the expense of the fruit. *G. Wythes, Nyon House.*

WATERLOO STRAWBERRY.—We have grown fifty plants of this new variety of Strawberry in pots this year, with a view to test its merits as a late fruit. It was allowed to slowly progress, and ripened its fruits in the beginning of the month of June. The fruits set well, and swelled to a very large size, and were handsome, and of a dark vermilion colour, the flesh firm, and of a rich appearance. It is not so prolific as President, although many more fruits are produced than are wanted for a crop. All this is most satisfactory, but when we come to speak of flavour, we are obliged to class it as a second-rate variety. Out-of-doors this variety was satisfactory last year, and it promises to be as good this year. Like Loxford Hall Seedling, it is rather tender, its foliage becoming crippled by frosts; this, however, does not appear to affect the crop in the least, and the plants quickly recover the check when growth recommences. I think it is a mistake to force many varieties of the Strawberry, for good results are obtained by growing two or three sorts. In vegetable growing also, in this respect, we may with advantage take a leaf out of the market gardener's book. *Thos. Coomber.*

GILBERT'S LATE VICTORIA BROCCOLI.—I should like to add a word in praise of this vegetable for late supply, for it helps to fill up the vacancy often existing between the end of the Broccoli and the beginning of the Cauliflower season, which has proved to be the case with me this year. It is a hardy variety, excellent in every way. *G. Abey, Aery Hill, Etham.*

SULPHATE OF COPPER—A CAUTION.—Having a very bad and persistent case of mildew. I thought of experimenting with the above—on a very small scale to begin with—but circumstances, which I now relate, delayed the operation. I, according to the receipt of a correspondent, a few weeks since, mixed 12 lb. of quicklime in one can, and in another 3 lb. of sulphate of copper to 2 gallons of water. As it was to be left two hours to dissolve, I mixed the same at night, intending to further dilute and use it in the morning, but when morning came I found the sulphate had eaten away the sides of a new galvanised can and escaped. Evidently this chemical requires using with great caution. *C. H.* [It should not be allowed to come in contact with iron. Ed.]

FROSTS IN JUNE IN THE WEST.—The thermometer at a place two miles distant from the town of Bath, registered on June 7th, 7°; 10th, 3°; and 21st, 4°; and several plots of Potatos, Runner Beans, Marrows, &c., have been cut down by the low temperature. If I remember rightly, it was June 27, 1866, when I was residing at Herriard Park, Hampshire, that the thermometer registered 14° of frost, which cut off all kinds of plants out-of-doors. *W. L., Bath.*

SEQUIA.—In regard to the origin of the name Sequoia, it is current among us Americans that Professor Endlicher so named our red-wood in honour of Sequoyah, a half-breed Cherokee, who had invented an alphabet for his tribe; but as long ago as 1878 Dr. Gray assured me that such a reference was unfounded—was an after-thought, and that Endlicher certainly meant by Sequoia that our giant tree was a sequoia, a follower, as it truly is the rear-guard of a past procession of prodigious trees. Now, did Endlicher leave any statement of his reason for Sequoia? Another question. I contemplate adopting Dr. Lindley's view regarding the distinctness of Wellingtonia, despite the almost identical characters

of the fruit. The vegetative characters of our two species of red-wood are certainly most marked; in the one case sempervirens resembling those of the Yew, in the other gigantea, the Cypress genus. Now if systematists without a qualm consent to separate Chamæcyparis from Cupressus, and Taxa from Picea, I cannot see why reasonably they hesitate to give Wellingtonia generic rank. All palæontological research seems to strengthen this opinion, for the vestiges of a score or more of fossil Taxodiæ fall decidedly into two classes—of Cypress-like and Taxus-like characters, indicating two marked lines of development, of which our two giants are respectively the descendants, so why not recognise the separate generic types, as in other similar cases. *J. G. L., California.*

FRUIT PROSPECTS ABOUT CORK.—Fruit prospects are not by any means so assuring as the splendid show of flower promised. We had severe hailstorms during the time when Apples were in flower, and the month of May was exceptionally wet, cold and sunless. Vegetables of sorts are growing splendidly. Potatos—early varieties—are said to show signs of disease. *Manster.*

LATE BROCCOLI, METHVEN'S JUNE.—This Broccoli well merits its name, it being of good size and whiteness. With us it has proved of great use, the last few heads being cut on June 13 from seed sown on March 23, 1880. *J. Mayne, Stowford Lodge, Ivy Bridge.*

THE PROPOSED HARDY FRUIT SHOW IN THE CITY.—Some time since I remember sending to the *Gardeners' Chronicle* a paper on the above subject, and it must have been quite two and a half years ago. It was the result of some correspondence with Mr. McKinlay, then of the Common Council. It is odd to find how suggestions, after the lapse of time, are taken up, and produced as novelties. My proposal was, that the Fruiters' Company should promote the show. I cannot now recall the date, but I feel certain the article in question was reported in the *Gardeners' Chronicle*. *A. Dean.*

THE STRAWBERRY LEAF DISEASE.

OCCASIONALLY we receive inquiries concerning the Strawberry leaf blight, its cause and its remedy. According to a late bulletin of Cornell University, the scientific name is Sphaerella Fragariae, or the Sphaerella of the Strawberry. It has been spoken of as spot disease, sun scald, Strawberry rust, but Professor Dudley thinks the name "leaf blight" most applicable. This blight first appears on the new leaves about the time of the setting of the fruit, and if the weather of the succeeding months be dry and hot, it causes serious injury to the vitality of the plantation.

Our readers will recognise this disease from the illustration (fig. 132), and also when we describe the spot as at first brownish or red-purple, and when fully matured, it has a circular centre, dead white, from one-eighth to one-quarter of an inch in diameter.

The red-purple colour is the result of the growth of filaments of the vegetative portion (mycelium) of this fungus, pushing their way between the cells of the interior of the leaf, disorganising their contents, and absorbing their fluids. Air spaces are thus formed in the centre of the spot, giving rise to the dead white appearance which results. The conidia are oblong, and very minute, and when they fall on a fresh leaf-surface, where there is a little moisture, soon germinate, bore their way through the epidermis, and give rise to fresh spots.

In addition to this mode of propagation by conidia, which are summer spores, and are short-lived, there are winter spores, grown in sacs, called asci. Each ascus, or sac, contains eight ascospores, and these are preserved in the dead leaves through the winter, and mature in early spring.

The remedy for this fungus is twofold (1), to use fungicides in summer, and (2), destruction of the old leaves in spring by burning over the Strawberry patch. As a fungicide, Professor Scribner recommends "3 oz. of carbonate of copper dissolved in 1 quart of water, which should be diluted to 20 gal."

This should be spread on the plantation after the crop is gathered, every two weeks until September.

The Manchester and the Wilson are especially liable to this disease, while the Sharpless, for instance, is less troubled with it, as a general rule. From the "*Canadian Horticulturist*."

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, June 24.—The Drill Hall, James Street, Westminster, was, on the above occasion of the last fortnightly meeting, gay with the bright colours of Paeonies, Delphiniums, Roses, and many another hardy flower. The visitors were more numerous than we are accustomed to find at these meetings, and generally they were content to listen restfully whilst the Rev. C. W. Dod discoursed most practically about herbaceous plants, soils, drainage, aspects, composts, species, and varieties.

A few Orchids were there, but Roses, as befits the season, were the flowers of the day, and they were good in form, substance, and colour, for so early a date, albeit late frosts, rain, and wind, have left tangible marks on the outer petals of many light flowers, or those thin of petal.

THE ROSES.

The National Rose Society's exhibition of Tea and Noisette Roses claims first notice at our hands. The largest class, for amateurs, was for twenty-four single Tea or Noisette Roses, the 1st prize falling to F. W. Flight, Esq., Cornstiles, Hants; the blooms were of medium size, and not all good, but yet nicely varied as regards colour, which was not the case with those taking a lower place. His best blooms were Madame Will-moz, Ethel Brownlow, Catherine Mermet—the last-named is a variety which has done well so far, and was in almost every stand in good condition. Mr. A. H. Gray, Beaulieu, Newlande-Hill, Bath, was 2nd, many of his blooms excelling those in the first lot, but the prevalent tints were yellow and white. 3rd, Mr. R. L. Knight, Bobbing Place, Sittingbourne; Souvenir d'Elise Vardon was an excellent Rose in this lot. Nine lots were shown in the above competition.

For twelve blooms, in not less than six varieties, Rev. H. A. Berners, Harkstead, Ipswich, was 1st, his Madame Watteville, Amazon (a nice yellow Rose), Devoniensis, C. Mermet, Jean Ducher, l'Ince of Wales, Marie Van Houtte, being good specimens; 2nd, Mr. O. G. Orpin, West Bergholt, Colchester, whose finest were Caroline Kuster, Souvenir d'un Ami, and Maréchal Niel. The Rev. Foster Melliar, Springton, Ipswich, took the 3rd prize; Souvenir d'Elise, Maréchal Niel, Annie Olivier, M. Van Houtte were good here. There were ten competitors in this class.

The prize-winners in the six Teas or Noisettes competition were—Mr. Ed. Mawley, Berkhamsted, 1st, and Mr. C. Cuttill, 2nd; and the best blooms were, in the 1st box, Souvenir d'un Ami, Jean Ducher, and Annie Olivier; and in the 2nd, Jean Ducher and Marie Van Houtte.

The Rev. F. B. Horsfield, Birch Vicarage, Hereford, was the winner with six single Teas, including a very fine Maréchal Niel. Mr. A. H. Gray, of Beaulieu was 2nd; in his collection there was a most symmetrical, small Comtesse de Nadailac. Rev. Foster Melliar was 3rd; a nice bloom of his Marie Van Houtte was fresh and perfect. The competition was rather keen, and of varieties, Annie Olivier, Madame Cusin, besides those already specified, were well shown.

For six trebles, Teas or Noisettes, Mr. A. H. Gray was 1st, the box containing Caroline Kuster, C. Mermet, Souvenir d'un Ami, and Maréchal Niel—a fairly good boxful; Rev. P. Roberts, Scole, Norfolk, was 2nd; and 3rd, Mr. J. J. Bradley, gr. to S. P. Budd, S. Gay Street, Bath.

A few nurserymen showed well in the classes set apart for them, notably Mr. B. F. Cant, of Colchester, who took the 1st prize for twenty-four Teas and Noisettes, and who had, besides the flowers found generally of good quality in other collections, Madame Hoste, The Bride, Niphotos (not often shown), Princess Beatrice, and Rubens; Mr. G. Prince, of Oxford, was 2nd, and showed good blooms of The Bride, Alia Rosea, Amazon, Adrien Christophe, Innocente Pirola, Madame Welch, &c.; Mr. F. Cant, of Colchester, took the 3rd prize, with large blooms, or, rather, blooms which were cut too late.

For the best twelve Teas, Messrs. Prior & Son, Myland's Nursery, Colchester, were the winners of the 1st prize; and the best blooms noticed were those we had previously observed in other boxes. Mr. G. Prince took 2nd, with nice blooms, full of substance, as the Oxford Roses usually are. The last-named nurseryman was 1st in Moss Roses, twelve varieties, shown in bunches; Messrs. Paul & Son, Old Nurseries, Cheshunt, being 2nd.

Mr. G. Cooling, Bath, showed Moss Roses and Buttonhole Roses, some old varieties not often seen being amongst them.

In a class for twelve blooms, in not less than eight varieties, Mr. Brown, gr. to Mrs. Waterlow, Great Doods, Reigate, was 1st, the blooms of Madame Pereire, Marquese de Castellane, Mrs. Baker, a fine crimson Rose; Marie Conté, and Mlle. Gabriel Luizez, being excellent; Mr. J. J. Bradley, Bath, was 2nd, with a nice box of dark-coloured varieties; 3rd, Mr. R. E. West, Reigate, also with dark Roses. The Silver Banksian Medal of the Royal Horticultural Society was awarded to a bloom of the Earl of Dufferin, which was in the last named stand.

Several boxfuls of his novelty in Tea Roses, Souvenir de S. A. Prince, were shown by Mr. G. Prince, the blooms coming up pretty well to the exhibitor's standard of excellence.

The best basket of Roses, tastefully arranged for room decoration, brought only two competitors, the Rev. H. B. Byron, Lyntonford Vicarage, who was awarded the 1st prize; and Mr. J. Bloxham, Eltham Court, Kent, who was placed 2nd.

Floral Committee.

Present: W. Marshall, Esq., in the Chair, and Messrs. B. Wynne, H. Herbst, J. Walker, W. C.

FIG. 122.—STRAWBERRY LEAF LUNGS.

Leach, H. Turner, R. B. Lowe, H. Cannell, C. Noble, G. Paul, H. H. D'Ombrain, Ed. Mawley, C. T. Drury, W. Goldring, and W. Holmes.

Messrs. J. Veitch & Sons, Royal Exotic Nurseries, Chelsea, S.W., staged a large collection of Delphiniums and Irises, the former being especially fine; a spike of *Archidamus* was particularly noticeable by reason of its great size, the variety is semi-double, and the flower is a mixture of purple and blue. True Blue is a showy bright blue single, Beethoven is pale blue with lilac sheen, and Nahomeh rich blue, single; these were the most striking out of about forty or fifty varieties. Among the Irises, Amazon, blue; Courtia, yellow; La prestienne, brown and purple; Bridesmaid, white; and L'honorable, rich yellow, may be selected. Blooms of their strain of hybrid *Aqueleias* were shown, and in some of them there were charming combinations of soft colours; other flowers were *Hemerocallis flava*, Poppies, *Campanula medio calyculata* in variety, Gaillardias, *Spiraea aruncus*, *Lupinus arboreus*, &c. The same firm also showed a collection of flowering shrubs, &c., having *Philadelphus microphyllus*, a recently introduced plant, illustrated in our issue for August 6, 1887, p. 156, it produces its white flowers in profusion, and forms a low compact bush; *Kalmia latifolia* and its variety *major splendens*, very fine; *Robinia hispida*, the purple *Acacia*, *Olearia macrodonta* with large masses of flower, but the foliage is very handsome, being coarsely-toothed on the margin, and having a silvery lustre; *Styrax japonica*, laden with its white flowers; *Andromeda speciosa*, and *Erica cinerea coccinea* minor forming a pretty, low cushion, sprinkled with flowers of a rich rose colour. There were also hybrid green-

house *Rhododendrons*, of which *Ajax* was a grand variety, the flower being very large and the truss well formed; colour, soft salmon-rose, with a pale throat. A few *Gloxinias*, *Spiraea astilboides*, and *Adiantum cuneatum Lambertianum*, a variety having loosely-disposed and narrow pinnules, completed the group.

From Messrs. Paul & Son, Old Nurseries, Cheshunt, came a few Roses in fine samples, among them being Mrs. Paul (Bourbon), a very full flower, of good substance, white, with rich crimson-shaded suffusion; John D. Pawle (H.P.), another of good form and substance, very brilliant intense crimson-carmine, shaded darker; Dowager Duchess of Marlborough (H.P.), carmine-rose, very pretty.

Messrs. Barr & Son, King Street, Covent Garden, W.C., had a collection of herbaceous flowers, in which Irises of the Niphon section were well represented; *Gillenia trifoliata*, *Lilium Davuricum*, *Ixias*, and varieties of herbaceous *Teonies* were also well shown; and a somewhat similar lot of cut herbaceous plants came from Mr. E. F. Such, Maidenhead, including *Campanulas*, Poppies, and *Valerianas*.

Messrs. W. Cutbush & Son, Highbate, sent small flowering plants of *Stephanotis floribunda*, and a few *Ivies*, one shown as *Lucida aurea* having a capital golden form.

New Roses were sent by Messrs. W. Paul & Son, Waltham Cross, N., among which were *Marchioness of Lorne*, a large flat flower of rich purple-crimson, and the foliage also is dark; the recent novelties *Duchess of Albany*, *Zenobia*, and *Spencer* were also exhibited.

Tuberous *Begonias* were shown by Messrs. H. Cannell & Sons, Swanley, Kent, who had good coloured double varieties in Mrs. Barron, cream, with heavy rose flush, and a Miss Eastwood, a delicate soft rose-pink, and fringed petals. Messrs. J. Laing & Sons, Forest Hill, S.E., sent a single yellow *Begonia* reputed to be fragrant.

A small collection of Paeonies were shown by Messrs. Paul & Son, Cheshunt, the best being *Berlioz*, rosy-mauve; *Daubenton*, light rose, with a purple shade; *Modeste*, with slit acuminate-florets and broad guard petals; *Felix Crousse*, purplish-rose—a fine subject; *Gloire de Douai*, semi-double, deep purple, shaded crimson, with a band of yellow anther separating the mass of petals horizontally into two parts. A great quantity of hardy flowers in much variety, including several choice varieties of *Potentilla* in crimson, and gold and crimson, *Ranunculus Gouani*, a small yellow *Bachelor's Button*, pretty and useful; the fine *Campanula nobilis alba*, with big bells and spikes; also C. Van Houtte, blue; Iceland and Shirley Poppies, Delphiniums, *Gaillardia hybrida splendens*, &c.

Other exhibits included a collection of show *Yelargoniums* from Mr. C. Turner, Royal Nursery, Slough, nicely-grown small plants; varieties of white Pinks, from Messrs. Laxton Bros, Bedford, one of which (Stanley) is an improved Mrs. Simkins, having greater substance and breadth of petal. Zonal *Yelargoniums* came from Messrs. J. R. Pearson & Son, Chilwell, Notts; Sir Percival was a pure white, and Midsummer, soft rich salmon, large flowered, and good truss, was a fine variety. Mr. Lynch, Botanic Gardens, Cambridge, had a collection of *Pentstemon* species, and specimens of *Macleamia insignis*, with its rich red flowers. Shirley Poppies came from the Rev. W. Wilks, Croydon. Mr. H. G. Jones, The Nurseries, Lewisham, sent a new yellow self *Carmination*, *Pride of Great Britain*, the flower of which is very large, and a clear yellow. A good lot of decorative and garden Roses, was sent by Messrs. G. Bunyard & Co., Maidstone, Kent; and Sir Charles W. Strickland, Bart., contributed *Crimm crassipes*, and a *Burphage* with dull red flowers, borne on long pedicels.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. De B. Crawshaw, S. Courtauld, T. B. Haywood, H. M. Pollett, H. Ballantine, J. Dombiny, J. Douglas, E. Hill, F. Sander, L. Castle, J. O'Brien, and Dr. M. T. Masters.

A few good new hybrids were exhibited by Messrs. J. Veitch & Sons, Chelsea. The most noteworthy was the result of crossing *Epidendrum radicans* with *Sophronitis grandiflora*, the latter being the seed-bearer; the resulting plant, shown as *× Epiphronitis Veitchii* partakes very strongly of the pollen parent in general appearance. As shown, the new hybrid was bearing three or four flowers on a scape 9 inches high, leafy at the base, the leaves varying in length from half an inch to nearly 2 inches, light green,

The flowers resemble those of *Epidendrum radicans*, but are broader in all parts, and the colour is richer; the lip has the same yellow area at the throat. Another interesting hybrid is *Laelio-Cattleya eximia* (*Cattleya Warneri* × *L. purpurata*), which is noteworthy as being the first cross of *L. purpurata* with the *C. Warneri* series. The petals and sepals are lilac, good size and substance, and the lip very large and expanding, deep purple with a lilac margin—a very handsome flower. In *L. C. Canhamie* (*C. Mossiae* × *L. purpurata*) we have the reverse of the cross which was named after Mr. Canham; the sepals and petals are pale lilac, almost white, while the lip is mottled with purple; *Thunia Veitchiana* × (*Bensonae* × *Marshalli*), was also shown. De B. Crawshaw, Esq., Rosefield, Sevenoaks, had a *Cattleya gigas*, Mrs. de B. Crawshaw, with a fine broad flat lip of deep colour. *Disa tripetaloides* was sent by Sir C. W. Strickland, Bt. S. Courtauld, Esq., Bocking Place, Braintree, showed *Masdevallia Courtauldiana* (*rosea* × *Shuttleworthii*) with one soft rose flower, much like that of *M. rosea*, and also a white flower of similar appearance, but smaller.

Mr. Cultimore, gr. to M. S. Cooke, Esq., Kingston Hill, Surrey, had a very elegant form of *Cattleya Gaskelliana*, soft rose-lilac in all its parts, with a central white area on the lip; he also sent *Catsumetum atratum*.

Messrs. F. Sander & Co., St. Albans, showed a basket of Phaius Humboldtii and varieties, also Angraecum Chailluanum and Sarcopodium Godeffianum; the flower is borne on a long stalk, and has a ground colour of yellowish-brown; the petals are linear, about an inch long, almost translucent, with a few brown spots and bases; the dorsal sepal is erect, oblong-acute, longer than the petals, and similarly coloured, but with a network of brown lines; the curiously hinged lip is white, with numerous small purple spots. The two lower sepals are bent curiously round forwards and inwards, and are heavily splashed with purple.

A few cut blooms of popular Orchids were sent by Messrs. James Crespin & Sons, Nelson Street, Bath.

Fruit Committee.

Present: Sir C. W. Strickland, Bart., in the Chair; and Messrs. J. Lee, T. F. Rivers, R. D. Johnson, H. Wier, P. Crowley, J. Cheal, T. J. Saltmarsh, J. Willard, W. Bates, F. Q. Lane, G. Wythes, H. Balderson, J. Hudson, J. Smith, and G. W. Cummins.

A box of very fine fruits of Lord Napier Nectarine was sent by Mr. Hudson, gr. to Messrs. Rothschild, Gunnersbury House, Acton; and Mr. T. H. Crisp, Canford Manor Gardens, Wimborne, had an equally fine dish of the variety *Stawick Elrige*.

Messrs. Paul & Son, Cheshunt, had a collection of early Strawberries, among which was Noble, Crescent Seedling, Commander, Pauline, and other favourite varieties.

Melons were sent by Messrs. J. Douglas, Great Gardens, Hford; Mr. G. Wythes, Syon Gardens, Brentford; and by Mr. Palmer, Thames Ditton, the last-named having a fruit of what was last year called *Thames Ditton Hero*, but now to be known as *Sutton's Triumph*; Mr. Palmer also had a dish of *Duke of Albany Pea*. *Rhubarb*, very stout stems, came from Mr. Osman, gardener at the South Metropolitan district Schools, Sutton, Surrey. Awards were made as follows:—

By the FLORAL COMMITTEE.

First-class Certificates.

To *Philadelphus microphyllus*, from Messrs. J. Veitch & Sons.

Awards of Merit.

To *Campanula persicifolia grandiflora alba*, from Messrs. Paul & Son.

To *Paeony Mad. Berlioz*, from Messrs. Paul & Son.

To *Rose Marchioness of Lorne*, from Messrs. W. Paul & Son.

Paeony Dauberton, from Messrs. Paul & Son.
Carnation Pride of Great Britain, from Mr. H. J. James.

Rose J. D. Pawle, from Messrs. Paul & Son.

Rose Mrs. Paul, from Messrs. Paul & Son.

Rhododendron Ajax, from Messrs. J. Veitch & Son.

Begonia Miss Eastwood, from Messrs. H. Cannell & Sons.

Pelargonium Midsummer, from Messrs. Pearson & Son.

By the ORCHID COMMITTEE.

First-class Certificates.

To *Cattleya Gaskelliana*, Cooke's var., from M. S. Cooke, Esq., Kingston Hill.

To *Ephronitis Veitchii* ×, from Messrs. J. Veitch & Sons.

To *Laelio-Cattleya eximia* ×, from Messrs. J. Veitch & Sons.

To *Sarcopodium Godeffianum*, from Messrs. F. Sander & Co.

Awards of Merit.

To *Masdevallia Courtauldiana* ×, from S. Courtauld, Esq.

To *Laelio-Cattleya Canhamie* ×, from Messrs. J. Veitch & Sons.

To *Disa tripetaloides*, from Sir C. W. Strickland.

By the FRUIT COMMITTEE.

To *Strawberry Crescent Seedling*, from Messrs. Paul & Son.

Medals.

Silver Gilt Bankian to Messrs. Paul & Son, and Messrs. J. Veitch & Son, for collections of hardy flowers and shrubs.

Silver Bankian to Messrs. Barr & Son, for a collection of hardy flowers.

Bronze Bankian to Messrs. H. Cannell & Sons, for a group of Paeonies.

YORK GALA.

The thirty-second annual exhibition was held on the 15th, 16th, and 20th instant, and the general excellence observed at these meetings was fully maintained, excepting in the competition for sixteen stove and greenhouse plants; there were but two exhibitors, and Mr. Cypher's plants were not up to their usual standard of excellence. Mr. Letts, gr. to the Earl of Zetland, Aske Hall, was 1st, with plants in his usual good style, clean and well-grown and flowered specimens, including superior plants of *Aphelexis amabilis* and *A. macrantha purpurea*, *Erica coccinea minor*, *Dipladenia amabilis*, *Statice profusa*, and fine plants of *Encelpharalos Altensteini* and *Cycas circinalis*. Mr. Cypher's best plants were *Erica Wilsonii*, *Aphelexis spectabilis*, *Stephanotis floribunda*, *Darwinia fuchsoides*, *Croton angustifolius*, and *Latania borbonica*.

For six stove and greenhouse plants, 1st, Mr. Letts, with a grandly-flowered plant of *Erica depressa*, and excellent examples of *Ixora Williamsii*, *Aphelexis macrantha purpurea*, *Dipladenia amabilis*, *Aphelexis rosea*, and *Statice profusa*.

J. B. Hodgkin, Esq., was 1st for three stove and greenhouse plants, and Arthur Wilson, Esq., 2nd.

Mr. Letts was 1st for six ornamental plants, including a superb *Cycas circinalis*, and very fine *Crotons Johannis* and *Mortfontainensis*; also for three ornamental plants. Mr. Letts' *Croton Queen Victoria*, *Thomsonii*, *angustifolius*, and *Johannis* were fine, and well-coloured.

Dracaenas were well represented, and Mr. McIntyre, gr. to Mrs. G. Pease, Darlington, took the 1st prize with a fine lot of plants; J. B. Hodgkin, Esq., being a close 2nd, as well as taking 1st for three admirable *Ericas*, consisting of *E. ventricosa magnifica*, *E. gunnifera*, and *E. ampullacea oblata*.

Alpine and herbaceous plants, and a large number of exotic and hardy Ferns, were staged. Good prizes were offered for *Gloxinias*, which brought a large number of plants, but chiefly small ones, not worthy of such good prizes; the same remark will apply to the herbaceous *Calceolarias* shown.

Roses in pots, for which also some liberal prizes were offered, were not so numerous as we have seen them; it would be a good thing for the Yorkites if one of our Southern growers would another year take down roses in pots as examples of excellence. It is much needed. The plants come every year to this show, and become very leggy, and run too much on pale colours; besides, the numerous sticks are painfully visible to the beholder.

One large tent was devoted to decorative groups, most of which were meritorious, although differing in style. For the larger group of 250 square feet, five competed: 1st, Mr. McIntyre, gr. to Mrs. G. Pease; 2nd, Mr. Blair, Trencham, whose group had a centre and two wings, filled up with *Masdevallias* and other Orchids; 3rd, Mr. Simpson, nurseryman, Selby; 4th and 5th prizes were also awarded.

For groups not exceeding 100 square feet, Mr. McIntyre was again 1st with a beautiful arrangement; 2nd, Mr. P. Kendal, gr. to T. M. Weddall, Esq., with a somewhat heavy-looking group.

For ten Orchids, Mr. Cypher was 1st here with fine specimens of *Cattleya Sanderiana*, *Oloontoglossum vexillarium*, *Laelia purpurata*, a grand mass of *Dendrobium infundibuliforme*, *Odontoglossum cirrosum*, *Cattleya Mendellii*, *C. mossie* with thirty blooms, *Dendrobium thyrsoiflorum*, *D. suavisimum*, and *Cypripedium barbatum*; 2nd, Mr. Blair, Trencham Gardens, who neglected naming several of his exhibits. For six Orchids, 1st, Mr. Blair. Three Orchids, 1st, Mr. Cypher, with *Cattleya Mendellii*, *Oloontoglossum cirrosum*, and a fine mass of *Dendrobium thyrsoiflorum*. Specimen Orchid, 1st, Mr. Nicholas, gr. to the Earl of Zetland, Up-leanham, for *Calanthe teratrifolia*, with twenty spikes.

Messrs. Charlesworth Shuttleworth & Co., Orchid importers, Bradford, sent a large collection of Orchids arranged amongst Ferns, but these were not in the competitions.

Pelargoniums have always been a strong point at York, and at nowhere else are such fine plants found as there. This time not so many were shown of the "show" section. Mr. Eastwood and Mr. McIntosh may now be fairly regarded as the two champion growers of the north, and usually run each other closely, their plants being wonderful specimens of cultural skill.

For twelve plants, 1st, Mr. Eastwood, gr. to Mrs. Pitley, Leeds; 2nd, Mr. McIntosh, gr. to J. T. Higston, Esq., York.

For six show *Pelargoniums*, Mr. McIntosh was 1st, and Mr. Eastwood 2nd; and the same positions were maintained for three *Pelargoniums*.

The zonals are always remarkable, Mr. Eastwood's 1st prize plants in the classes for twelve, six, and three being as fine as it is possible to grow them, the plants averaging 4 feet in diameter, and well grown and abundantly flowered. In some cases a very unsightly system of tying prevailed, drawing the trusses in from the sides to form a central head of bloom.

Specimen Ivy-leaf *Pelargoniums* were invited, and large pyramidal specimens were exhibited in response to the invitation. Mr. Henry Pybus' 1st prize plants were large, handsome, and well flowered.

Fuchsias were numerous, and also of good quality. *Taberosus Begonias* could not be said to be so good as we have seen them before at York; and the dinner-table plants, which were numerous and of much excellence, were made to form a pretty background to the fruit.

The cut blooms of the *Roses* made a grand display, and some of the blooms were very large and finely developed, especially the *Tea-scented* varieties. Quite 1500 blooms were staged in the various classes. There were four exhibits, of seventy-two blooms each. Mr. B. K. Cant, Mr. F. Cant, Messrs. Paul & Sons, Cheshunt; and Messrs. Cooling & Son, Bath, won the prizes in the order of their names.

For forty-eight blooms, six exhibits.—1st, 2nd, 3rd, and 4th prizes in the following order:—Mr. B. R. Cant, Mr. F. Cant, Messrs. D. Prior & Son, Messrs. Paul & Son.

For thirty-six blooms, six exhibits.—1st, 2nd, 3rd, and 4th, Mr. George Prince, Mr. B. R. Cant, Mr. F. Cant, and P. Budd, Esq.

For twenty-four blooms, five exhibits.—1st, 2nd, and 3rd to Mr. G. Prince, Mr. B. R. Cant, and Mr. F. Cant.

Five stands of twelve *Tea Roses* were staged.—1st, Mr. G. Prince; 2nd, B. R. Cant; 3rd, Messrs. D. Prior & Son; and for twelve *Teas*, one variety (six exhibits).—1st, Mr. G. Prince, with a grand lot of *Comtesse de Nadaiillac*; 2nd, Mr. B. R. Cant, with a fine twelve *Souvenir d'un Ami*; 3rd, Messrs. Prior & Son. For twelve *P.P.*'s, of one variety, Mr. B. R. Cant was 1st, with a stand of Ulrich Brunner, superb blooms; and Messrs. Prior & Son, Colchester, 2nd with *Lady Mary Fitzwilliam*. The *Amateurs'* classes were also well filled. Amongst *H.P.*'s throughout, Mrs. John Laing, Viscountess Folkestone, Etienne Princess Victoria, Lady Alice, Mary Bennett, Etienne Levy, Ulrich Brunner, were all very fine; and *Teas* Princess of Wales, *Comtesse de Watteville*, *Comtesse de Nadaiillac*, and *Souvenir d'Elise Vardon*, very fine in several stands.

For twelve bunches of stove and greenhouse flowers, and for six bunches also, 1st, Mr. Blair, Trencham, with Orchids. Messrs. Perkins & Son, Coventry, was 1st in both classes for ball and bridal bouquets.

The cut blooms of *Paeonies* and *Pyrethrums* made a most effective show, being in large numbers, and of good quality. Mr. Thomas Ware, Tottenham, offered special prizes for twenty-four varieties, of which Messrs. Harness & Son, Bedale,

won the 1st prize, and Mr. Thomas Battenbury the 2nd. Messrs. Harkness & Son were also 1st for twelve species of herbaceous plants, and there were several other good lots staged. Messrs. J. Cocker & Sons, Aberdeen, were 1st in each class for twenty-four double and twenty-four single Pyrethrams.

Amongst the miscellaneous exhibits, Messrs. Backhouse & Son, York, had an interesting group of rare and lovely species of herbaceous plants; Messrs. Birkenhead, Sale, had fully 500 Ferns of species and rarer varieties; Messrs. Ryder & Son, Manchester, a collection of Begonia blooms; Messrs. H. Cannell & Sons, cut blooms of double and single-flowered Begonias, regal and zonal Pelargoniums; Messrs. Dickson (Limited), Chester, a fine lot of cut blooms of herbaceous Ferns; Messrs. Paul & Son, Chesham, a large display of cut blooms of herbaceous and other plants; Mr. John Forbes, Hawick, an extensive collection of Pansies; Mr. Andrew Irvine, Kyles of Bute, Pansies, and other exhibitors added to this portion of the exhibition. Some good vegetables formed a not uninteresting part of the display. Fifty thousand persons attended during the three days, and £1579 was taken at the entrance to the exhibition.

Fruit of most kinds was excellent for so early a part of the season. Grapes being well coloured and well finished, and Peaches and Nectarines were large and of high colour. In the class for two distinct varieties, Mr. McIndoe, Hutton Hall, was 1st with very fine Grosse Mignonne Peaches, Magdala Peach, highly coloured Stanwick Elurge Nectarines, fine Muscat and Black Hamburg Grapes, Premier and Best of All Melons, two Queen Pines, and some Figs; 2nd, Mr. R. Dawes, gr., Temple Newsam, with very fine dishes of Lord Napier and Elurge Nectarine, Bellegarde and Abec Peaches, three small but well finished bunches of Madresfield Court Grape, a Queen Pine, Temple Newsome hybrid Melon, and other fruits; 3rd, Mr. J. Edmunds, gr., to the Duke of St. Albans, Betchworth, in whose collection were good Black Hamburg Grapes, and Peaches and Nectarines. For six varieties of fruit: 1st, Mr. McIndoe, with good Muscat and Black Hamburg Grapes, and a fine Best of All Melon; 2nd, Mr. Blair, gr., Trentham, who had a good Queen Pine, and Black Grapes, and an unnamed seedling Melon. For four varieties of fruits: 1st, Mr. McIndoe; 2nd, Mr. J. Clayton, gr., Grimston Park.

One Pine-apple: 1st, Mr. McIndoe, 2nd, Mr. Parker. For three bunches of Black Grapes, Mr. McIndoe and Mr. J. Allison, gr., to Lord Holdham, were placed equal 1st with admirable examples; 2nd, Mr. James Johnson, Boston Spa; 3rd, Mr. W. Wallis, gr., Kirby Hall.

For three bunches of white Grapes, Mr. Allison was well ahead with some richly coloured medium bunches of Backland Sweetwater; 2nd, Mr. Wallis; 3rd, Mr. McIndoe.

A good lot of Melons were exhibited in the various classes for them.

For dish of Peaches, nine exhibits were staged. 1st, Mr. W. H. Divers, gr., to J. T. Hopwood, Esq., Kotton Hall, Stamford, with very fine early Alberts; 2nd, Mr. G. Taylor, gr., to Sir J. Ramsden, Bart.

Nectarines (ten exhibits).—1st, Mr. Blair, with very fine Lord Napier's; 2nd, Mr. Dawes.

A few dishes of good Figs were staged, and Mr. Divers carried off the 1st prize for Strawberries with very fine fruit of Auguste Nicotise; and Mr. McIndoe the 2nd prize with Sir Harry, fine fruits, well coloured.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending June 21, is furnished from the Meteorological Office:—

"The weather has been very dull, with frequent rain in Ireland and Scotland, occasional falls of rain over England, and cloudy condition generally.

"The temperature has not differed materially from the mean; in the east of Scotland and north-east of England it has been 1° above, and in most other parts of the kingdom 1° below the normal. The highest of the maxima were recorded either on the 15th or 16th, and varied from 65° in Scotland, N., and 61° in Scotland, W., to 71° over central, southern, and south-western England, and 73° in England, E. The lowest of the minima, which were recorded on somewhat variable dates, ranged from 36° in the north and east of Scotland and

north-east of England, to 48° in Ireland, and to 51° in the 'Channel Islands.'

"The rainfall has been more than the mean in the north and west of Scotland, and equal to it in England, N.W. In all other districts, however, the fall has been rather less than the normal.

"Bright sunshine has continued very deficient generally, the percentage of the possible duration having ranged from 14 to 17 in Ireland, from 16 to 20 in Scotland, and from 19 to 33 in England. In the 'Channel Islands,' however, as much as 41 per cent. has been recorded."

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named, and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Rows list districts like 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 and their corresponding weather data.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts.—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Growing Areas.—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

Obituary.

B. S. WILLIAMS.—The announcement of the death of this distinguished horticulturist will come as a great shock to his many friends and acquaintances. Those who know him intimately, however, have known for the last two years that his condition was hopeless, and he died, after lengthened suffering, on the 21th inst., in his sixty-eighth year. For some years previous to his starting in business at Holloway in 1854 (at first in partnership with Mr. Robert Parker), he was gardener to the late C. B. Warner, Esq., of the Woodlands, Hoddeston, and it was during this period that he wrote, in 1851, under the encouragement of Dr. Lindley and of Mr. Bellenden Ker, that series of articles on Orchid cultivation, under the title of "Orchids for the Million," in these columns, which were subsequently expanded into the Orchid Growers' Manual, which has since passed through six editions. Williams was therefore a pioneer in Orchid culture, and no one possessed a more thorough knowledge of them and of their requirements than he. He provided the manuscript for Warner's Select Orchidaceous Plants, and in 1881 commenced the monthly illustrated periodical so well known as the Orchid Album, which is still continued.

As an exhibitor of specimen plants, Williams also attained and retained a great reputation; indeed, we do not know where to look for a more thorough gardener than he. He upheld the honour of English horticulture not only at home but abroad, where not

only his Orchids but his Cyclamens, his Primulas, his Amaryllis, and many other subjects, proved that he possessed excellent judgment as well as unusual skill. He was a loyal and staunch friend to this Journal throughout, and we can hardly adequately acknowledge our sense of the aid he from time to time, particularly in past years, rendered us. When information, such as he possessed was required, we—and others no doubt can say the same—were never disappointed when we applied to "Ben Williams." He was an earnest supporter of the gardening charities, and was indeed a thoroughly representative man, whose loss we shall all regret with no ordinary sorrow. The funeral will take place at the Highgate Cemetery, on Monday, June 30, at 12.30 noon.

MARKETS.

COVENT GARDEN, June 25.

We are now receiving good supplies of outdoor Strawberries in better condition, and prices have fallen considerably. Peaches reaching us in large quantities, meeting with a slow sale. Business fair. James Welber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing fruit prices: Apples, Esieve, 1 6-7 0; Peaches, dozen, 2 0-0 0; Tasmanian, cases 15 0-0 0; Pine-apples, St. Mi-chael, each, 2 0 6 0; Grapes, lb., 1 6-3 0; Carrots, per case, 4 0-0 0; Strawberries, lb., 0 4-1 0; Melons, each, 1 6-3 6.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing vegetable prices: Asparagus, English, 12 0-0 0; Mustard and Cress, 0 4-0 0; Beans, French, lb., 2 0-0 0; Onions, per bunch, 0 8-0 0; Beet, red, per dozen 1 0-2 0; Parsley, per bunch, 0 6-0 0; Carrots, per bunch, 0 6-0 0; Rhubarb, per bundle 0 6-0 0; Cauliflowers, each, 0 3-0 0; Spinach, punnet, 2 0-0 0; Celery, per bundle, 1 6-2 0; Shallots, per lb., 0 6-0 0; Cressheads, each, 1 0-1 6; Spices, per bushel, 6 0-0 0; Radishes, per dozen, 2 0-0 0; Spices, per bundle, 1 6-0 0; Herbs, per bunch, 0 4-0 0; Brussel Sprouts, 1 lb., 0 3-0 0; Leeks, per bunch, 0 3-0 0; Tomatoes, per lb., 1 0-0 0; Lettuces, per dozen, 1 6-0 0; Turnips, per bunch, 0 4-0 0; Mushrooms, punnet 1 6-0 0; new, 0 4-0 0.

POTATOES, NEW.—The market has become much weaker, principal causes, indifferent quality and samples arriving, which have given general dissatisfaction. Jersey Kidneys average 6s. 6d.; French Kidneys, 6s.; Rounds, 5s.; Cornish, 7s.; Old Potatoes may now be considered, over J. B. Thomas.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing plant prices: Arabis Sebaldii, doz., 6 0-18 0; Foliage plants, various, 2 0-10 0; Arum Lilies, per doz., 8 0-12 0; Onis, each, 2 0-10 0; Aspidistra, doz., 18 0-42 0; Fuchsia, per doz., 1 0-9 0; Heliotropes, plant, each, 7 6-10 6; Heliotropes, per doz., 5 16 0; Begonias, per doz., 6 0-12 0; Hydrangeas, doz., 12 0-18 0; Calceos, per doz., 12 0-24 0; Ivy Geranium, p. doz., 3 0-6 0; Cacti, per doz., 6 0-9 0; Lilliums, various, per dozen, 18 0-36 0; Cyperus, per dozen, 1 0-12 0; Lobelia, per doz., 4 0-6 0; Datura, ferns, per dozen, 20 0-60 0; Marguerites, doz., 6 0-12 0; Verandas, per doz., 12 0-24 0; Mignonette, per doz., 4 0-8 0; Erica, Gaultheria, 2 0-0 0; Musk, per dozen, 2 0-4 0; per dozen, 18 0-18 0; Nasturtiums, p. doz., 4 0-0 0; Centaureas, doz., 15 0-24 0; Palms in var., 2 0-6 0; Eranthis, in var., 2 0-0 0; lot, per dozen, 3 0-6 0; per doz., 3 0-6 0; Eryngiums, in var., 6 0-24 0; Petunias, per doz., 6 0-9 0; Eranthis, in var., doz., 4 0-18 0; Roses, various, doz., 12 0-24 0; Ferns, in var., doz., 4 0-18 0; (Fairy), per doz., 6 0-9 0; Ferns elastic, each 1 6-7 0; Saxifrages, per doz., 18 0-24 0.

* * Bedding plants in variety in boxes, and also in pots.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flower prices: Abutilons, 12 bun., 2 0-5 0; Pinks, various, 12 bun., 2 0-4 0; Ranunculus, per bun., 2 0-4 0; Pelargoniums, 12 bun., 3 0-4 0; Carnations, 12 blms., 1 0-2 0; 12 spr., 0 4-0 6; —dozen spray, 0 6-1 0; —dozen double, 12; 1 0-1 8; Carnations, 12 blms., 0 6-4 0; Primulas, 12 bun., 1 0-1 8; Equisetum, 12 bun., 2 0-3 0; Pinks, 12 bunches 6 0-18 0; Enchirids, per dozen 1 0-6 0; Poppies, or Hearts, 12 bunches, 1 0-2 0; Gardenias, 12 bunches 1 6-3 0; 12 bunches, 1 0-2 0; Ires, various, 12 bun., 6 0-18 0; Poppies, various, doz., 1 0-2 0; Ixi, doz. bunches, 3 0-6 0; bunches 0 1-6 0; Heliotropes, 12 spr., 0 6-0 0; Pyrethrum, 12 bun., 3 0-6 0; Lilacs, white, Fr., Jun., 4 0-6 0; Roses, 7, per doz., 0 5-1 6; —coloured, dozen 2 0-4 0; —red, per 12 bun., 3 0-6 0; Maiden Hair Fern, doz., 0 4-0 0; —Saffra, dozen, 1 0-2 0; Marguerites, 12 bun., 3 0-6 0; —outdoor, 12 bun., 6 0-12 0; Mignonette, 12 bun., 2 0-6 0; Ranunculus, 12 bun., 2 0-4 0; Spirea, doz. sprays, 0 6-1 0; Myosotis or Forget-me-not, 12 bun., 2 0-4 0; Stephanotis, 12 spr., 1 6-3 0; Nasturtiums, 12 bun., 2 0-4 0; various, 3 0-6 0; doz. bun., 1 6-6 0; Tuberoses, 12 blms., 0 6-1 0.

ORCHID-BLOOM in variety.

SEEDS.

LONDON: June 25.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market barely attended, with almost a complete dearth of business. All varieties of Clover seeds are just now neglected. Retail orders are received for sowing Mustard and Rape seed. Bird seeds sell slowly on lower terms. Choice blue Peas, being very scarce, are firm. New Zealand advices describe Cocksfoot stocks as exhausted. Feeding Linseed is somewhat dearer. Other articles at this quiet season offer no subject for remark.

CORN.

Averages.—Official statement of the average price of British corn, imperial measure, for the week ending June 21:—Wheat, 32s. 9d.; Barley, 24s. 11d.; Oats, 19s. 11d. For the corresponding period last year:—Wheat, 28s. 7d.; Barley, 24s. 8d.; Oats, 18s. 7d.

FRUIT AND VEGETABLES.

SPITALFIELDS: June 25.—Good supplies of all kinds of farm and market garden produce; demand good. Moderate quantity of fruit; trade fair. Prices as under:—Fruit: White Cherries, 6s. 6d. to 7s. 6d. per half-sieve; Strawberries, 5s. to 6s. per dozen bunches; Gooseberries, 3s. 9d. to 4s. 6d. per half-sieve; English Tomatoes, 6s. to 7s. per sack; foreign do., 1s. to 1s. 3d. per box; Rhubarb, 1s. 9d. to 2s. 6d. per dozen bunches. Vegetables: Cabbages, 2s. to 4s. per tally; Spinach, 4d. to 9d. per bushel; Asparagus, 1s. to 1s. 6d. per bundle of 100 heads; Seakale, 1s. to 1s. 3d. per punnet; Radishes, 2s. to 3s. per tally; Turnips, 2s. 6d. to 3s. per dozen bunches; Peas, 2s. to 3s. per bushel; do., 4s. 6d. to 5s. 6d. per sack; Carrots, 2s. 6d. to 3s. 6d. per dozen bunches; Parsley, 1s. to 1s. 6d. do.; Mint, 1s. 6d. to 2s. per dozen bunches; Beetroots, 8d. to 1s. per dozen; frame Cucumbers, 1s. 6d. to 2s. do.; Egyptian Onions, 1s. 6d. to 5s. per cwt.; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets; Cos Lettuces, 6d. to 9d. per score; Endive, 1s. to 1s. 3d. per dozen.

STRATFORD: June 25.—The supply has been good during the past week, and a fair trade was done at the undermentioned prices:—Cabbages, 1s. 6d. to 4s. per tally; Greens, 1s. to 1s. 6d. per dozen bunches. Potatoes: English light soil Magnums, 40s. to 60s. per ton; Mangels, 12s. to 17s. do.; Onions, Egyptian, 6s. 6d. to 7s. 6d. per cwt.; Watercress, 7d. per dozen bunches; Cucumbers, 2s. to 5s. per dozen; Carrots, 2s. to 4s. per dozen bunches; Mint, 2s. to 3s. do.; Beetroot, 10d. to 1s. per dozen; Peas, 2s. 6d. to 3s. per sieve; do., 4s. to 6s. 6d. per bag; Cherries, 2s. 6d. to 5s. per basket; Strawberries, 2s. 6d. to 5s. per peck; Appricots, 1s. to 1s. 6d. per box; Gooseberries, 4s. to 6s. 6d. per half sieve.

POTATOES.

BOROUGH AND SPITALFIELDS: June 24.—Quotations:—Old: Scotch Regents, 35s. to 45s.; Magnums, blackland, 35s. to 40s.; Lincolns, 45s. to 50s.; Yorks, 55s. to 60s.; Kent and Essex, 50s. to 55s.; Scotch, 55s. to 60s.; Imperators, 40s. to 60s. per ton. New: Kidneys, 45 to 47 10s.; French do., 45 to 47; Rounds, 45 to 45 10s. per ton.

STRATFORD: June 25.—Quotations:—New: Jersey kidneys, 6s. 6d. to 7s. 6d.; do. flukes, 7s. 6d. to 8s.; Cherbourg rounds, 5s. 6d. to 6s.; do. flukes, 6s. 6d. to 7s.; St. Malo flukes, 6s. to 7s.; do. rounds, 5s. to 5s. 6d. per cwt.

SPITALFIELDS: June 25.—Quotations:—New: Jersey rounds, 5s. to 5s. 6d.; do. kidneys, 6s. to 6s. 3d.; do. flukes, 7s. to 7s. 6d.; Cherbourg rounds, 4s. 6d. to 6s.; do. kidneys, 5s. to 5s. 9d.; do. flukes, 5s. 6d. to 6s. 6d.; St. Malo rounds, 4s. 6d. to 4s. 9d.; do. kidneys, 5s. to 5s. 6d.; Lisbon rounds, 3s. to 4s. per cwt. Old: Magnums, 35s. to 60s. per ton.

VARIORUM.

LATE FLOWERING AZALEAS.—Mr. Anthony Waterer sends a fine lot of Azaleas derived from *A. occidentalis*. They are apparently very free flowering, and in colour range from white and pale pink to deep pink. They are longer in the tube, and larger generally than most hardy Azaleas, fragrant and altogether very desirable novelties.

SAD ACCIDENT AT CHELSEA.—On Thursday evening, June 19, six of the young men employed in Messrs. VEITCH'S Nursery, Chelsea, went on to the Thames for a row, and just as they were returning, their boat was upset by the wash of a passing steamer. Three of the occupants were picked up and saved, but, most unfortunately, the other three were drowned; and their names were—W. WILSON, lately of The Dell, Egham; W. CHAPPEL, lately of Hardwicke, Bury St. Edmunds; and F. SMITH, from Gwernyfed Park, Breconshire.

NOTICES TO CORRESPONDENTS.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

ANTHRINUM: A. Y. A form in which the petals are represented by small green leaves. Does the plant produce seed? It is very curious.

ARATACARIA: Constant Reader. For the tree to bear cones here is not a rarity, but plants to be raised from them is a rare occurrence.

BOOKS: B. Baynes & Burdidge's *Domestic Floriculture*. (W. Blackwood & Sons.)

DISEASED PEAR: T. B. 1, Pear Blight; 2, Unknown: plenty of guess-work; 3, Remedy, none. Is there a brick-kick in the neighbourhood, or is it the effect of frost?

GARDEN LABOUR: *Veritas*. Without fuller particulars we cannot answer your query. You must tell us in what manner the place is kept, the mode of planting the flower-beds and borders, and the season at which the floral display is required; number in family of proprietor, and if staying visitors are numerous; if the men are able-bodied, or very aged, or very young; kind of soil to be dealt with, what extra garden work has to be done, and how much is the mowed area, &c.

GRAVES: A. *Berlus*. The heaviest bunch of Black Hamburgh Grape we believe to be one shown at Belfast on August 20, 1874, by Mr. Hunter, it turned the scale at 21 lb. 12 oz. But the heaviest bunch of any variety is one shown by Mr. Curror, at Edinburgh, September 16, 1875, it weighed 26 lb. 4 oz. The variety was Trebbiano.

GREENHOUSE: J. W. M. *Horticultural Buildings*, by F. A. Fawkes. (Swann Sonnenschein, Le Bas, & Lowry, Paternoster Square.)

HOLLY: J. P. The insect devouring the leaves and shoots of your Holly is probably *Phytomyza* spines, the leaf-miner of the Holly. Please send specimens, and leaves and shoots. Dust the leaves of the Holly with soot and lime, or sprinkle them with Quassia water.

KEW GARDEN: *Collye*. You should apply to the Director of Kew for information.

MARKET GROWER: J. W. E. Begin in autumn or spring, preferably the former. You can only obtain the instruction you stand in need of by advertising for an instructor who will be willing to take you for a few hours daily.

NAMES OF PLANTS: C. J. E. 1, We do not know the Rose; 2, *Cupressus*; 3, *Thuja orientalis* var.; 4, *Lycocystia formosa*; 5, *Juniperus sinensis*; 6, *Fitzroya patagonica*; 7, *Thuja plicata*; 8, *Cupressus Lawsoniana*; 9, *Podocarpus chilensis*.—*Invicta*, 1, *Helicichrysum rosmarinifolium*; 2, *Geranium collinum*.—*Munster*, 1, *Pernettya angustifolia*; 2, *P. mucronata*; 3, *Benthania fragifera*; 4, *Daboecia polifolia*; 5, *Cephalotaxus Fortunei*; 6, *Phyllirea angustifolia*.—*L. L.* 1, *Phloxis frutescens*; 2, *Humex sanguineus*; 3, *Camellia sativa*; 4, not recognized; 5, *Saxifraga Cauposi*.—*T. Wakeford*, 1, *Campanula zosterata*; 2, *Tradescantia discolor*; 3, *Abutilon Sellowianum*; 4, *Mesembryanthemum*.—*J. C. K.* *Alouzoa Warscewiczii*.—*N. No.* 2, *Cupressus torulosa*.—*J. Siphon*, 1, *Nephradium Filix Mas* var. abbreviata. 2,

Aspidium coriaceum; 3, *Lycopodium fontinale*; 4, *Gymnogramma calomelanos*, dwarf sterile; 5, *Trichomanes pyxidifera*; 6, *Adiantum capillus veneris*; 7, *Leptogramma hemellioide*; 2a, *Usnea*.—*W. D. C.* *Hirneola polytricha* (Fries).—*J. Y.* *Crataegus taenactifolia*.—*H. F.* 1, *Crimium petiolatum*; 2, *Eschyanthus fulgens*; 3, *Campylobotrys regalis*; 4, *Pothos argyrea*.—*J. S.* *Stipley*, *Oncidium Schimi* probably.—*J. H.* 1, *Diplazium glutinosum*; 2, *Cestrum corymbosum*; 3, impossible to name from such a scrap. The rest we cannot undertake to name.—*Reader*. Not known.—*F. A. E. D.* *Cephalanthera grandiflora*, a rare native Orchid.—*N. T.* *Malcolmia maritima*.—*S. S.* 1, *Rosmarinus officinalis*; 2, *Philadelphus grandiflorus*; 3, *Allium moly*.—*A. H. B.* 1, *Stanhopea tigrina*; 2, *Gualtheria Shallon*; 3, *Pernettya angustifolia*; 4, *Gnaphalium*; 5, *Barbarea vulgaris*, fl.-pl.; 6, *Phytomena comosum*.—*G. S.* 1, *Bryonia dioica*; 2, *Stachys silvatica*; 3, *Aster alpinus*; 4, *Egopodium Podagraria*; 5, *Epilobium montanum*; 6, *Campanula rotundifolia*; 7, *Campanula fragilis*.—*G. C.* 1, *Pinus Pinaster* var.; 2, *P. Benthiana* is only a seedling form of *ponderosa*, which is excessively variable.—*J. H.* must send better specimens.

OEIRA—OCHIRO—OCHIRA: E. B. This is the West Indian and Central American plant *Abelmoschus esculentus*, of which the pods are edible. There are several species. It requires a warm house, but not to be much shaded. The treatment afforded Chile capsicum would probably suit the plant.

POTATO PLANTS ROTTING: R. *Veitch & Son*. It is impossible to assign a reason from the material sent, for certain plants perishing. As the subterranean parts are in a bad state, the cause of injury should probably be sought for in the ground. We have known wireworms produce a not dissimilar state of things.

PROFITABLE GARDENING IN A WARM GREENHOUSE: *Amzouz*. Early Lily of the Valley, *Stephanotis floribunda*, *Trachelospermum jasminoides*, Early Roses, *Criminus*, *Eucharis amazonica*, *E. candida*, Early Tuberoses. *Falms* take too long a time to develop true leaves, and Ferns are being "done" by too many others to be profitable.

RAINFALL: N. T. New Zealand, Auckland, 48 inches; Napier, 34 inches; Wellington, 51 inches; Nelson, 61 inches; Christchurch, 24 inches; and Dunedin, 29 inches. The rains are, as a rule, heavier in the maritime parts, and dew and fog in the mountains; but the latter are not injurious to health, and are immensely beneficial to vegetation. Queensland, Brisbane, 49 inches; Rockhampton, 32 inches; Mackay, 68 inches; and Cooktown, 61 inches. We do not know which are the wettest parts—the coast land, or that nearer mountains further inland; but vegetation grows luxuriantly over much of the colony.

SMILES: S. R. If you read *Plant Life*, Bradbury Agnew & Co., Limited, 10, Bouverie Street, Fleet Street, E.C., you will find plenty of illustrations.

THICKENED ROOTS OF SCILLA: W. H. These are commonly met with in Scillas and Crocuses. They seem to act as reserve stores of water or food, but their purpose is not known with certainty.

WOOLLEN FORTING-FITS: J. R. D. Pour boiling-water into all crevices, especially those between the walls and the Cucumber-bed. Keep small pots about filled with hay, which should be examined every morning, and the insects therein destroyed. Put toads into the house. Try sprinklings of carbolic acid on the floor.

COMMUNICATIONS RECEIVED.—F. V. M., Melbourne.—H. G. (next week).—G. C.—A. Y.—W. E.—G. H.—W. J.—A. E.—Messrs. Clibour.—H. E. Vicky (my thanks).—A. C.—H. E. Hartley (many thanks).—Viscount L.—J. A.—J. Testimonials.

"SIR.—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MAURICE STELLER."
 "Hornby Castle, Lancaster, February, 1900."
 "Major FOSTER has much pleasure in stating that the vineyard and forcing houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."
 "Estate of Mr. Ripley, Yorkshire, January 23, 1900."

"Sir HENRY DOWLEY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its years' wear and tear extremely well, and has hitherto cost nothing to keep in repair."

HELLIWELL, 9, Victoria Street, Westminster.

GARDENER, or HANDY-MAN (good), in a Gentleman's Estate or Institution. Good character from last places.—J. LANGLOIS, 53, Woodchur Street, Drayton Park, N.

TO FLORISTS.—Situation wanted by a young Lady in the Cut Flower Department. Ten years' experience in the Making up of Bouquets, Wreaths, Crosses, Sprays, &c. First-class references.—E. G., 8, Troughton Road, New Charlton, Kent, S.E.

HOLLOWAY'S PILLS.—Nervous irritability.—No part of the human machine requires more constant supervision than the nervous system—for upon it our health—and even life—depends. These Pills strengthen the nerves, and are the safest general purifiers of the blood. Nausea, headache, giddiness, numbness, and mental apathy yield to them. They dispatch in a summary manner those distressing dyspeptic symptoms, stomachic flatulencies, and those at the pit of the stomach, abdominal distension, and regulate alike capricious appetites and confined bowels.—The commonly accompanying signs of a nervous system are: a general debility, and a loss of energy are particularly recommended to persons of studious and sedentary habits, who gradually fall into a nervous and irritable state, unless some such restorative be occasionally taken.
